ACCREDITATION

Stanford University is accredited by the Accrediting Commission for Senior Colleges and Universities of the Western Association of Schools and Colleges. In addition, certain programs of the University have specialized accreditation. For information, contact the Office of the Registrar.

STATEMENT OF NONDISCRIMINATORY POLICY

Stanford University admits students of either sex and any race, color, religion, sexual orientation, or national and ethnic origin to all the rights, privileges, programs, and activities generally accorded or made available to students at the University. It does not discriminate against students on the basis of sex, race, age, color, disability, religion, sexual orientation, or national and ethnic origin in the administration of its educational policies, admissions policies, scholarships and loan programs, and athletic and other University-administered programs.

ADDITIONAL INFORMATION

Additional information on Stanford University can be obtained through Stanford's website at www.stanford.edu.

Every effort is made to ensure that the course information, applicable policies, and other materials contained in this bulletin are accurate and current at the time the bulletin goes to press. The University reserves the right to make changes at any time without prior notice. The bulletin is also available on the University's web site at: www.stanford.edu/dept/registrar/bulletin/; check the online version for the currently applicable policies and information.

Welcome to Stanford

On October 1, 1891, nearly 500 enthusiastic young men and women were on hand for opening day ceremonies at Leland Stanford Junior University. They came from all over: many from California, some who followed professors hired from other colleges and universities, and some simply seeking adventure in the West. They came to seize a special opportunity, to be part of the pioneer class in a brand new university. They stayed to help turn an ambitious dream into a thriving reality. As a pioneer faculty member recalled, “Hope was in every heart, and the presiding spirit of freedom prompted us to dare greatly.”

For Leland and Jane Stanford of that day, the University was the realization of a dream and a fitting tribute to the memory of their only son, who had died of typhoid fever weeks before his 16th birthday, at an age when many young men and women were planning their college educations.

From the beginning, it was clear that Stanford would be different. It was coeducational at a time when single-sex colleges were the norm. It was non-sectarian when most private colleges were still affiliated with a church. And it offered a broad, flexible program of study while most schools insisted on a rigid curriculum of classical studies. Though there were many difficulties during the first months (housing was inadequate, microscopes and books were late in arriving from the East) the first year foretold greatness. As Jane Stanford wrote in the summer of 1892, “Even our fondest hopes have been realized.”

What manner of people were this man and this woman who had the intelligence, the means, the faith, and the daring to plan a major university in Pacific soil, far from the nation’s center of culture?

ABOUT LELAND STANFORD

Although he was educated as a lawyer, Leland Stanford, together with Jane, came to California in 1852 to join his five brothers in their mercantile business in the gold fields. They established large-scale operations in Sacramento, where Mr. Stanford became a leading figure in California business and politics. One of the “Big Four” who built the western link of the first transcontinental railroad, he was elected Governor of California and later United States Senator. One of the founders of the Republican Party in California, he was an ardent follower of Abraham Lincoln and is credited with keeping California in the Union during the Civil War.

THE CASE FOR A LIBERAL EDUCATION

Despite the enormous success they achieved in their lives, Governor and Mrs. Stanford had come from families of modest means and had built their way up through a life of hard work. So it was natural that their first thoughts were to establish an institution where young men and women could “grapple successfully with the practicalities of life.” As their thoughts matured, however, these ideas of “practical education” enlarged to the concept of producing cultured and useful citizens who were well-prepared for professional success. In a statement of the case for liberal education that was remarkable for its time, Leland Stanford wrote, “I attach great importance to general literature for the enlargement of the mind and for giving business capacity. I think I have noticed that technically educated boys do not make the most successful businessmen. The imagination needs to be cultivated and developed to assure success in life. A man will never construct anything he cannot conceive.”

STANFORD LANDS AND ARCHITECTURE

The campus occupies what was once Leland Stanford’s Palo Alto farm and the favorite residence of the Stanford family. The Stanfords purchased an existing estate in 1876 and later acquired much of the land in the local watershed for their stock farm, orchards, and vineyards. The name of the farm came from the tree El Palo Alto, a coast redwood (Sequoia sempervirens) that still stands near the northwest corner of the property on the edge of San Francisquito Creek. Many years ago, one of the winter floods that periodically rushed down the arroyo tore off one of its twin trunks, but half of the venerable old tree lives on, a gaunt and time-scarred monument. Named in 1700 by Spanish explorers, El Palo Alto has been the University’s symbol and the centerpiece of its official seal.

The Stanfords gave their farm to the University in the Founding Grant of 1885. They personally financed the entire cost of the construction and operation of the University until 1903, when surviving founder Jane Stanford turned over control to the Board of Trustees. The founding gift was in excess of $21 million, not including the land and buildings.

The general concept for the University grounds and buildings was conceived by Frederick Law Olmsted, the designer of Central Park in New York. A brilliant young Boston architect, Charles Allerton Coolidge, further developed the concept in the style of his late mentor, Henry Hobson Richardson. The style, called Richardsonian Romanesque, is a blend of Romanesque and Mission Revival architecture. It is characterized by rectilinear sandstone buildings joined by covered arcades formed of successive half-circle arches, the latter supported by short columns with decorated capitals.

More than one hundred years later, the University still enjoys the original 8,180 acres (almost 13 square miles) of grassy fields, eucalyptus groves, and rolling hills that were the Stanfords’ generous legacy, as well as the Quadrangle of “long corridors with their stately pillars” at the center of campus. It is still true, as the philosopher William James said, during his stint as a visiting professor, that the climate is “so friendly...that every morning wakes one fresh for new amounts of work.”

CURRENT PERSPECTIVES

In other ways, the University has changed tremendously on its way to recognition as one of the world’s great universities. At the hub of a vital and diverse Bay Area, Stanford is an hour’s drive south of San Francisco and just a few miles north of the Silicon Valley, an area dotted with computer and high technology firms largely spawned by the University’s faculty and graduates. On campus, students and faculty enjoy new libraries, modern laboratories, sports facilities, and comfortable residences. Contemporary sculpture, as well as pieces from the Stanford Museum’s extensive collection of sculpture by Auguste Rodin, is placed throughout the campus, providing unexpected pleasures at many turns.

The Iris and B. Gerald Cantor Center for Visual Arts at Stanford University opened in January 1999. The center includes the historic museum building, the Rodin Sculpture Garden and a new wing with spacious galleries, auditorium, cafe, and bookshop. At the Stanford Medical Center, world-renowned for its research, teaching, and patient care, scientists and physicians are searching for answers to fundamental questions about health and disease. Ninety miles down the coast, at Stanford’s Hopkins Marine Station on the Monterey Bay, scientists are working to better understand the mechanisms of evolution, human development, and ecological systems.

The University is organized into seven schools: Earth Sciences, Education, Engineering, the Graduate School of Business, Humanities and Sciences, Law, and Medicine. In addition, there are more than 30 interdisciplinary centers, programs, and research laboratories (including the Hoover Institution on War, Revolution and Peace; the Institute for International Studies; the Stanford Linear Accelerator Center; and the Stanford Center for the Study of Families, Children, and Youth) where faculty from a wide range of fields bring different perspectives to bear on issues and problems. Stanford’s Overseas Studies Program offers students in all fields remarkable opportunities for study abroad, with campuses in Berlin, Buenos Aires, Florence, Kyoto, Oxford, Paris, Puebla, Rome, and Santiago.

STANFORD PEOPLE

By any measure, Stanford’s faculty, which number approximately 1,595, is one of the most distinguished in the nation. It includes 12 Nobel laureates, 4 Pulitzer Prize winners, 18 National Medal of Science winners, 122 members of the National Academy of Sciences, 210 members of the American Academy of Arts and Sciences, 78 members of the National Academy of Engineering, and 24 members of the National Academy of Education. Yet beyond their array of honors, what truly
distinguishes Stanford faculty is their commitment to sharing knowledge with their students. The great majority of professors teach undergraduates both in introductory lecture classes and in small advanced seminars. Enrollment in Autumn Quarter 1999 totaled 14,219, of whom 6,594 were undergraduates and 7,625 were graduate students. Like the faculty, the Stanford student body is distinguished. Approximately eight students apply to Stanford for every place in the freshman class. Seventy-one Stanford students have been named Rhodes Scholars and 39 have been named Marshall Scholars. In 1998-99, the completion or graduation rate for students who entered Stanford University full-time in 1993 was 91 percent. Stanford awarded 4,596 degrees in 1998-99, of which 1,687 were baccalaureate and 2,909 were advanced degrees.

Stanford students also shine in a tremendous array of activities outside the classroom from student government to music, theater, and journalism. Through the Haas Center for Public Service, students participate in dozens of community service activities, such as tutoring programs for children in nearby East Palo Alto, the Hunger Project, and the Arbor Free Clinic.

In the athletic arena, Stanford students have enjoyed tremendous success as well. Stanford fields teams in 33 Division I varsity sports. Of Stanford’s 78 NCAA team titles, 35 have been captured in the past ten years, placing Stanford at the top among the nation’s most title-winning schools of the ’90s. In 1999-2000, Stanford won two NCAA team titles in men’s tennis and men’s track and field and won the Sears Director’s Cup, emblematic of the top overall athletic program in the country, for the sixth consecutive season. Six teams placed second in the nation last year (baseball, women’s volleyball, men’s water polo, synchronized swimming, women’s tennis, and women’s golf) and Stanford became the first school in Pac-10 history to win conference championships in football, men’s basketball and baseball in the same year. Athletic success has reached beyond The Farm, as well, with 49 Stanford athletes and coaches taking part in the 1996 Olympics in Atlanta. Intramural and club sports are also popular; over 1,000 students take part in the club sports program, while participation in the intramural program has reached 9,000 with many active in more than one sport.

Stanford graduates can be found in an extraordinary variety of places: in space (Sally Ride, ’73, Ph.D. ’78, was the first American woman in space); on the news (Ted Koppel, A.M. ’62, created the successful program Nightline); off-Broadway (David Henry Hwang, ’79, received a Tony Award for his celebrated work, M. Butterfly); at the helm of major corporations (Bill Hewlett and David Packard, both ’34, Enr. ’39, started their multi-billion dollar company, Hewlett-Packard, in a nearby garage; and, more recently, Scott McNealy, ’80, founded Sun Microsystems, and Chih-yuan (Jerry) Yang, ’94, and David Filo, ’90, founded Yahoo); and on the U.S. Supreme Court (four Stanford graduates, Sandra Day O’Connor, ’50, J.D. ’53; Anthony Kennedy, ’58; William Rehnquist, ’48, J.D. ’52; and Stephen Breyer, ’59, currently sit on the high court).

LOOKING AHEAD

In her address to the Board of Trustees, in 1904, Jane Stanford said, “Let us not be afraid to outgrow old thoughts and ways, and dare to think on new lines as to the future of the work under our care.” Her thoughts echo in the words of former Stanford President Gerhard Casper, who has said, “The true University must reinvent itself every day…. At Stanford, these are days of such reconsideration and fresh support for our fundamental tasks: teaching, learning, and research.”

ADMINISTRATIVE ORGANIZATION

EXECUTIVE OFFICERS, 2000-01

President: John L. Hennessy
Provost: John Etchemendy
Vice President for Business Affairs and Chief Financial Officer: to be announced
Vice President for Development: John B. Ford
Vice Provost and Dean of Research and Graduate Policy: Charles H. Kruger
Vice Provost and Dean for Institutional Planning and Operations: to be announced
Vice Provost and Dean of Student Affairs: James Montoya
Chief Executive Officer, Stanford Management Company: Michael McCaffery
Chief Information Officer, Information Technology Systems and Services: Raman Khanna
General Counsel: (Acting) Debra Zumwalt
Interim President and Chief Executive Officer, UCSF Stanford Health Care: David Hunter
University Librarian and Director of Academic Information Resources: Michael A. Keller
Dean of Graduate School of Business: Robert Joss
Dean of Continuing Studies Program: Charles Junkerwart
Dean of School of Earth Sciences: Franklin M. Orr, Jr.
Dean of School of Education: Debra J. Stipek; Interim Dean (Autumn): Denis Phillips
Dean of School of Engineering: James D. Plummer
Dean of School of Humanities and Sciences: Malcolm R. Beasley
Dean of School of Law: Kathleen Sullivan
Dean of School of Medicine: Eugene A. Bauer
Director of Hoover Institution: John Raisian
Director of Stanford Linear Accelerator Center: Jonathan Dorfan

ORGANIZATION

BOARD OF TRUSTEES

Powers and Duties—The Board of Trustees is custodian of the endowment and all properties of the University. The Board administers the invested funds, sets the annual budget, and determines policies for operation and control of the University. The powers and duties of the Board of Trustees derive from the Founding Grant, amendments, legislation, and court decrees. In addition, the Board operates under its own bylaws and a series of resolutions on major policy.

Membership—Board membership is set at 35, including the President of the University who serves ex officio and with vote. Trustees serve a five-year term and are eligible for appointment to one additional five-year term. At the conclusion of that term, a Trustee is not eligible for reelection until after a lapse of one year. Eight of the Trustees are elected or appointed in accordance with the Rules Governing the Election or Appointment of Alumni Nominated Trustees. Four of the Alumni Nominated Trustees must be 35 years of age or under and four older than 35 when elected. They serve a five-year term.

**Officers of the Board**—The officers of the board are a chair, one or more vice chairs, and a secretary. Officers are elected to one-year terms at the annual meeting in June. Their terms of office begin July 1.

**Committees**—Standing committees of the Board are Academic Policy, Planning, and Management; Alumni and External Affairs; Audit; Development; Finance; Land and Buildings; and Medical Center. Special committees include Compensation, Investment Responsibility, Litigation, and Nominations.

**Meetings**—The Board generally meets five times each year.

**THE PRESIDENT**

The Founding Grant prescribes that the Board of Trustees shall appoint the President of the University and that the Board shall give to the President the following powers:

- To prescribe the duties of the professors and teachers.
- To prescribe and enforce the course of study and the mode and manner of teaching.
- Such other powers as will enable the President to control the educational part of the University to such an extent that the President may justly be held responsible for the course of study therein and for the good conduct and capacity of the professors and teachers.
- The President is also responsible for the management of financial and business affairs of the University, including operation of the physical plant.
- The President appoints the following, subject to confirmation by the Board: Provost, Vice President for Business Affairs and Chief Financial Officer, Vice President for Development, and General Counsel.

**COMMITTEES AND PANELS**

University Committees are appointed by and are primarily responsible to the President. Such committees deal with matters on which the responsibility for recommendation or action is clearly diffused among different constituencies of the University. In accordance with the *Report on the Committee Structure of the University*, Academic Council members are appointed to University Committees on nomination of the Senate Committee on Committees and student members on nomination of the Associated Students of Stanford University (ASSU) Committee on Nominations. The President takes the initiative in the appointment of staff members to such committees. Although immediately responsible to the President, University Committees may be called upon to report to the Senate of the Academic Council or the ASSU. Charges to such committees are set by the President on recommendation of the Committee on Committees and others. There are nine standing University Committees, as follows:

- Advisory Panel on Investment Responsibility (AP-IR)
- Committee on Athletics, Physical Education, and Recreation (C-APER)
- Committee on Environmental Health and Safety (C-EHES)
- Committee on Faculty and Staff Benefits (C-FSB)
- Committee on Land and Building Development (C-LBD)
- Committee on Public Events (C-PE)
- Editorial Board of the University Press (EB-UP)
- KZSU Advisory Board (KZSU)
- Panel on Outdoor Art (P-OA)

Additionally there are six standing administrative panels which are appointed by the Vice Provost and Dean of Research and Graduate Study, and which report through him to the President.

- Administrative Panel on Biosafety
- Administrative Panel on Human Subjects in Medical Research-01
- Administrative Panel on Human Subjects in Medical Research-03
- Administrative Panel on Human Subjects in Medical Research-04
- Administrative Panel on Human Subjects in Non-Medical Research-02
- Administrative Panel on Laboratory Animal Care
- Administrative Panel on Radiological Safety

**PROVOST**

The Provost, as the chief academic and budget officer, administers the academic program (instruction and research in schools and other unaffiliated units) and University services in support of the academic program (student affairs, libraries and information resources, and institutional planning). In the absence or inability of the President to act, the Provost becomes the Acting President of the University. The Provost has shares with the President conduct of the University's relations with other educational institutions, groups, and associations.

**Schools of the University**—The program of instruction in the University is organized into seven schools: Graduate School of Business, School of Earth Sciences, School of Education, School of Engineering, School of Humanities and Sciences, School of Law, School of Medicine.

The deans of the schools report to the Provost.

**THE ACADEMIC COUNCIL**

According to the Articles of Organization of the Faculty, originally adopted by the Board of Trustees in 1904 and revised in 1977, the powers and authority of the faculty are vested in the Academic Council consisting of: (1) the President of the University; (2) tenure-line faculty—Assistant, Associate, and Full Professor; (3) nontenure-line faculty—Associate and Full Professor followed by the parenthetical notation (Teaching), (Performance), (Applied Research), or (Clinical); (4) nontenure-line research faculty—Research Assistant Professor, Associate Professor (Research), Professor (Research); (5) Senior Fellows in specified policy centers and institutes; and (6) certain specified officers of academic administration.

In the Spring of 1968, the Academic Council approved the charter for a Senate to be composed of 55 representatives elected by the Hare System of Proportional Representation and, as ex officio nonvoting members, deans of the academic schools and certain major officers of academic administration.

In the allocation of representation, each school constitutes a major constituency. The Senate may create from time to time other major constituencies as conditions warrant. Approximately one-half of the representatives are allocated to constituencies on the basis of the number of students in those constituencies and the remainder on the basis of the number of members of the Academic Council from each constituency.

**COMMITTEES**

Committees of the Academic Council are created by and responsible to the Senate of the Academic Council and are appointed by the Committee on Committees of the Senate. Such committees deal with academic policy matters on which the primary responsibility for action and decision lies with the Academic Council or, by delegation, the Senate. Pursuant to the Senate’s acceptance on September 25, 1969 of the *Report from the Committee on Committees on the Committee Structure of the University* and subsequent Senate action, the Senate has established seven standing Committees of the Academic Council, as follows:

- Committee on Academic Appraisal and Achievement (C-AA)
- Committee on Academic Computing and Information Systems (C-ACIS)
- Committee on Graduate Studies (C-GS)
- Committee on Libraries (C-Lib)
- Committee on Research (C-Res)
- Committee on Undergraduate Admissions and Financial Aid (C-UAFA)
- Committee on Undergraduate Studies (C-US)

The Senate has also created a Planning and Policy Board of the Senate to consider long-range strategic issues of concern to the faculty.

Information regarding charges to these committees is available from the Office of the Academic Secretary to the University.

**ASSOCIATED STUDENTS**

Two weeks after the University opened in 1891, students met to form the Associated Students of Stanford University (ASSU). All registered students are members of the Association. They are governed by the ASSU
Constitution and Bylaws, which was last revised and approved by student vote in April 1999, and approved by the President in September 1999.

**Executive**—The President and Vice President serve as the chief executives and representatives for the Association. The Financial Manager acts as business manager of the ASSU, CEO of Stanford Student Enterprises (SSE) and controller of the Students' Organizations Fund, wherein ASSU and student organization funds are deposited.

**Legislative**—There are two legislative bodies, an Undergraduate Senate and a Graduate Student Council, that work together to determine the Association's budgetary, financial, investment, business, and operating policies. In addition, each entity provides funding for student organizations, recommends student appointments to University committees and advocates on behalf of its constituents. Each body has 15 elected representatives and an elected chair. Both meet regularly to conduct Association business and discuss and act on issues pertinent to student life at Stanford.
Admission and Financial Aid

ADMISSION

UNDERGRADUATE MATRICULATED STUDY

In order to preserve the residential character of the University and to maintain a favorable student-faculty ratio, Stanford has a limited undergraduate enrollment. The anticipated size of the freshman class is 1,600 students. Between 100 and 120 transfer students, entering either the sophomore or junior class, are also admitted each year. For both freshman and transfer admission, the University receives many more applications from qualified students than there are places available.

Stanford’s undergraduate community is drawn from throughout the United States and many other countries. It includes men and women whose abilities, intellectual interests, and personal qualities will allow them to benefit from and contribute to the University’s wide range of teaching and research programs in the humanities, sciences, and engineering. The University admits students with highly developed skills in particular areas, as well as those with versatility in a number of fields. A comprehensive financial aid program aims to promote broad socioeconomic representation. Stanford is committed to meeting the University-computed financial need of each admitted student and, subject to its community and to the education of their fellow students, and proceed to a lifetime of intellectual, personal, and societal accomplishment.

Since application procedures and requirements vary from year to year, specific information regarding application for admission as either a freshman or transfer student should be obtained by writing to the Office of Undergraduate Admission, Stanford University, Stanford, CA 94305-3005.

NONMATRICULATED STUDY

Admission to Stanford as a nonmatriculated student during Autumn, Winter, and Spring Quarters is not routinely approved except under extenuating circumstances. Nonmatriculated students authorized to enroll at Stanford University are not admitted to any Stanford degree program and are permitted to register for a specific period, usually one, two, or three quarters. Financial assistance from Stanford University is not available. Acceptance as a nonmatriculated student does not guarantee subsequent admission as a matriculated student. Students interested in nonmatriculated status during the Autumn, Winter, and Spring Quarters of the next academic year. Awards are seldom made to students who enter the University in Winter, Spring, and Summer quarters; such applicants must meet the same financial aid application requirements as those entering in Autumn Quarter.

Applications may be submitted electronically for graduate programs in the schools of Earth Sciences, Education, Engineering, Humanities and Sciences, and the Biosciences (non-M.D. programs in Medicine). Application instructions may be found at www.stanford.edu/dept/registrar.

The Guide to Graduate Admission and application forms for graduate matriculated study may be obtained from Graduate Admissions, Registrar’s Office, Old Union, Stanford University, Stanford, California 94305-3005, except for the following programs:

Business—Applicants should write to Director of Admissions of the M.B.A., Ph.D., or Sloan Program, Graduate School of Business, Stanford University, Stanford, California 94305-5015 for information and application forms.

Law—Applicants should write to Director of Admissions, School of Law, Stanford University, Stanford, California 94305. The Law School Admissions Test is required.

M.D. Program—Applicants should write to Admissions Committee, School of Medicine, 851 Welch Road, Palo Alto, California 94304 for
NONMATRICULATED STUDY

Grades of colleges and universities of recognized standing who hold a U.S. bachelor's degree or its equivalent are eligible to apply for nonmatriculated graduate student status. This status may be granted to students of demonstrated ability who are not seeking an advanced degree from Stanford University, but who would benefit from course work at Stanford for a variety of reasons. A 3.0 or 'B' grade average in prior studies is required. Nonmatriculated admission is valid only for a given academic year or a part thereof. Students who wish to reenroll in a subsequent academic year must reapply.

Nonmatriculated students are not permitted to enroll in certain courses, such as those in the following departments or programs: Film and Broadcasting courses in Communication; graduate level courses in Psychology; all courses in Computer Science, Economics, Electrical Engineering, International Policy Studies, and the School of Medicine. Nonmatriculated students receive academic credit for courses satisfactorily completed and may obtain an official transcript. They may use University facilities and services. In classes of limited enrollment, students in degree programs have priority. Nonmatriculated students may apply for housing but will have a low priority for assignment. No fellowships, assistantships, or Stanford loans are available for nonmatriculated students.

Nonmatriculated students who later apply for admission to a degree program must meet the standard admission requirements and should not anticipate special priority because of work completed as a nonmatriculated student. Students who are admitted to a degree program may apply a maximum of one year to graduate nonmatriculated study toward the residency requirement for a master's degree and two quarters for the Engineer or Ph.D. degree.

Application forms for nonmatriculated status during the regular academic year are available from the Assistant Dean, Registrar's Office, Old Union, Stanford, CA 94305-3005. Deadlines for applying are included with the forms and are generally two months before the start of the quarter.

Applicants interested in nonmatriculated student status for the Summer Quarter only should contact the Summer Session Office, Building 590, Room 104, Stanford University, Stanford, CA 94305-3005.

POSTDOCTORAL SCHOLARS

Prospective postdoctoral scholars should write directly to the department in which they wish to study.

Postdoctoral scholars who are paid as Research Affiliates through Stanford grants and contracts must enroll as nonmatriculated graduate students each quarter of their appointments. They are thereby eligible for most student benefits. Scholars who are supported by other funds have the option of registering, except in the School of Medicine which requires that all postdoctoral scholars be registered. Postdoctoral scholars must have received the Ph.D. within the last three years or the M.D. within the last six years.

The School of Medicine has an additional special student category, the School of Medicine Fellow, which is open to those holding the M.D. for more than six years or the Ph.D. for more than three years and who have been invited to Stanford to undertake further training in modern medical technology.

Postdoctoral scholars who are not required to register as nonmatriculated students may request Visiting Scholar status. This option is available only to an individual who is visiting from an outside institution or organization, who has a doctoral degree or is a recognized expert in his or her field, and whose source of funding is not Stanford. Appointments are authorized by department chairs. Visiting scholars are not eligible for student benefits.

VISITING RESEARCHERS

In limited instances, it is to the benefit of Stanford faculty to permit persons who have not yet obtained a Ph.D. (or its foreign equivalent) or who are not recognized experts in their fields to engage in research on the Stanford campus using Stanford research facilities. Such instances might include students at other universities who are engaged in graduate-level research in a field of interest to the faculty member, a person doing a laboratory rotation as part of a larger research study or grant, or employees of companies who are conducting research which requires specialized equipment available only at Stanford.

In these instances, since the person is not eligible for Visiting Scholar status, they may be eligible to register as nonmatriculated graduate students in the Visiting Researcher category for a maximum of one year. Invited persons must be qualified to conduct research at a level comparable to that of other Stanford graduate students, and the research must be of benefit to Stanford as well as to the visitor. Admission forms for visiting researchers are submitted to the Registrar's Office by the department issuing the invitation.

Visiting researchers are charged the Permit to Attend for Services Only (PSO) tuition rate quarterly and may waive the University's student medical insurance plan only if they have comparable coverage with another carrier. They may not enroll in or audit any courses, but in quarters they are registered, are eligible for the usual student benefits of nonmatriculated student status. Visiting researchers may apply for housing, but they will have a low priority for assignments. No fellowships, assistantships, or Stanford loans are available for visiting researchers. Stanford cannot certify visiting researchers for deferment of U.S. educational loans. Citizens of other countries who enter the United States to be visiting researchers at Stanford must have an IAP-66 issued by the Bechtel International Center and must register each quarter, including Summer Quarter, to maintain their visa status.

VISAS FOR FOREIGN STUDENTS

All students who are not U.S. citizens or permanent residents must obtain visas for their stay in the United States. The types of visas available for students are the following:

1. Student Visa (F-1), obtained with an I-20 Certificate of Eligibility issued by Stanford University. The graduate student on an F-1 visa must enroll in a full course of study. The accompanying spouse or child enters on an F-2 visa. F-2 visa holders may not work.

2. Exchange-Visitor Visa (J-1), obtained with an IAP-66 Certificate of Eligibility issued by Stanford University or a sponsoring agency. This visa is required for graduate students sponsored by certain agencies, foundations, and governments. In some cases, Exchange-Visitors must leave the United States at the conclusion of their programs, may not change visa status, and may not apply for permanent residency in the United States until they have returned to their home countries for at least two years. The spouse of an Exchange-Visitor enters on a J-2 visa and may, in some cases, obtain permission to work.

The certificate of eligibility is issued to a student accepted for admission only upon receipt of evidence of satisfactory proficiency in the English language and certification of adequate financial support. A student transferring from another school must obtain a new visa with a Stanford certificate of eligibility.

Information on visas is sent to admitted graduate students from the Graduate Admissions Office. Information on visas for postdoctoral scholars and visiting researchers may be obtained from the Bechtel International Center.

The University requires that all students who are not U.S. citizens or permanent residents maintain a visa status that allows registration as students.
FINANCIAL AID

UNDERGRADUATE

The University has a comprehensive need-based financial aid program for its undergraduate students (except some international students) who meet various conditions required by the state or federal government, the University, and other outside donors.

In awarding its own funds, the University assumes that students and their parents (or spouse, in the case of married students) accept the first and primary responsibility for meeting the standard educational costs established by the University. Additionally, Stanford expects financial aid applicants to apply for and use resources from state, federal, and private funding sources, contribute from their earnings during nonenrollment periods (for example, summer) and use student loans and earnings from part-time employment during the academic year to meet educational expenses. If Stanford determines that an applicant and/or her/his family cannot meet these expenses, the University may offer student loans, recommend part-time employment during the academic year, and/or award scholarships or grants to help meet these costs. Stanford’s policy generally is to exclude undergraduate students from being considered financially independent of their parents for University-administered scholarship and grant aid unless the student is an orphan, a ward of the court, at least 25 or has an extremely adverse home situation.

In awarding Stanford financial aid funds to meet need (that is, any gap remaining after reducing the standard budget by the University-determined family resources and any outside resources to which the student is entitled such as state or Pell grants, tuition benefits, and so on), Stanford first offers “self-help,” which includes student loans and an academic year earnings expectation. The University normally expects that during enrollment periods, students will work and borrow up to approximately 16 percent of the standard budget. The self-help expectation may be lower for certain categories of students including those from low-income families, those who are academically in the top five to ten percent of an entering class, and those who bring diversity to the Stanford student body. If the University-determined need is greater than the self-help expectation, Stanford awards scholarship or grant funds to meet the remaining need.

Scholarships or grants from outside private sources may change the University’s financial aid award. If the total in outside scholarships exceeds the need-based earnings expectation and loan portion of the financial aid package, the University then reduces its own scholarship or grant fund to meet the remaining need.

The University considers applicants for its own scholarship and grant support beyond the twelfth quarter only if enrollment is essential in order to complete the minimum requirements for the first baccalaureate degree or major; a total of fifteen quarters is the limit for such aid. Students who enroll for a fifth year in pursuit of a coterminal program, a minor, a second major, a second degree, or the B.A.S. degree are not eligible for University scholarship and grant consideration but may apply for student loans.

APPLICANT DOCUMENTS

The documents the applicant must submit each year for financial aid consideration vary depending on the applicant’s nationality and the type of funds sought.

U.S. citizens and permanent residents who wish to be considered for all available funding administered by Stanford should submit the following documents. Canadians file the following except the FAFSA.

1. Free Application for Student Aid (FAFSA), which must be processed by the federal processor. California residents must also submit a GPA Verification Form or SAT scores to the California Student Aid Commission (CSAC) by March 2, 2001, for Cal Grant consideration.
2. The PROFILE processed by the College Scholarship Service (CSS).

A complete application for U.S. citizens and permanent residents applying for Stafford loan consideration only includes:

1. Free Application For Federal Student Aid (FAFSA), which must be processed by the federal processor.

A complete application for international students (except Canadians) includes the Foreign Student Financial Aid Application and the Certificate of Finances.

Students whose application materials are filed after the published deadlines, who have not borrowed or worked in prior years, or who have not secured all external funds such as Pell and Cal Grants, can expect higher levels of self-help in their financial aid packages.

Applicants and their parents are required to submit accurate and complete information on all application documents. To monitor for accuracy and reliability of information, the University participates in a U.S. Department of Education project that samples the reliability of the data on a number of applications. The FAO may request documents, in addition to the application materials, to verify this information. Students will have their financial aid funds withheld or canceled and their future registration held if they fail to submit the information requested. Financial aid awards may change as a result of the verification process.

NOTIFICATION DATES

The FAO will notify early decision applicants who apply by the November filing date in December. The FAO will notify the freshman applicants who apply by the February 1 filing date in early April. Transfer applicants who submit complete applications by the March 15 filing date are normally notified of their financial aid award within 10 days of their notice of admission.

The FAO begins mailing award notices to continuing and returning applicants approximately the middle of July. Applicants who file after the filing date may not have a financial aid award or funds secured for disbursement by the Autumn Quarter payment due date.

PAYMENT AND FINANCING OPTIONS

Students whose financial aid is not available at the time registration fees are due may use the University’s Deferred Payment Plan.

Parent loan and financing options may help families of students receiving financial aid meet the expected parent contribution. Many of these options are also available to families who do not qualify or apply for financial aid but feel the need for some extended financial credit to help meet the costs of attendance. Parents should also contact their employers for information about programs that may be available to them as employees’ benefits to help meet college costs.

GRADUATE

Academic departments at Stanford University offer financial support to many graduate students. Funds are most often targeted to doctoral candidates and rarely cover all of a student’s expenses. In addition to Stanford support, students usually need to use long-term loans, savings, liquidated assets, a spouse’s earnings, or parental support. They are expected to study full time in order to attain the degree as soon as possible. Students with families to support or with medical or other special needs should budget income and expenses carefully. Loan funds alone may be insufficient to meet the expenses not covered by the Stanford award.
Students should consider part-time employment only after consultation with their department advisers and if no other alternative is possible. Students fully supported by Stanford are limited to additional employment of no more than eight hours per week; due to visa restrictions, international students may not be similarly employed.

Note—No fellowships, assistantships, or loans are available for nonmatriculated students.

FELLOWSHIPS AND ASSISTANTSHIPS
Fellowships, research assistantships, and teaching assistantships are an integral part of the educational program for many graduate students; they also provide funds for graduate student support. As part of their academic plans for students, departments determine assignments for graduate assistantships and fellowships; they also determine the disposition of funds available for graduate fellowship and assistantship appointments. Academic program, academic merit, and availability of funds are the primary considerations in the awarding of graduate financial support. The availability of aid varies considerably among departments and programs. Support offers range from partial tuition fellowships to awards that provide full tuition and a living stipend. Some departments admit only those students to whom they can offer support or who have guaranteed funds from other outside sources. Other departments may offer admission but are unable to provide financial assistance due to limited financial resources. Very few awards are given for study toward terminal master’s degrees.

Application procedures and deadlines for admission and financial aid are described in the Guide to Graduate Admission. Fellowships and assistantships are normally awarded between March 15 and April 15, in accordance with the Council of Graduate Schools resolution. Acceptance of a Stanford award obliges the student to inform the department of any other support received. The Stanford award may be adjusted (see "Outside Fellowships" below). Recipients of all graduate fellowships and assistantships must register each quarter of their appointment.

POSTDOCTORAL FELLOWSHIPS
Stanford has two categories of postdoctoral scholars. Postdoctoral Research Affiliates are classified as advanced students who are employed on contracts and on research and training grants. Postdoctoral Fellows are categorized as advanced students whose funding is from outside sources, typically foundations and foreign governments. Inquiry should be made directly to the department.

OUTSIDE FELLOWSHIPS
Many Stanford graduate students hold fellowships won in national competition from outside agencies such as the National Science Foundation. Information on application procedures and terms of such fellowship programs may be obtained from reference materials in the applicant’s current academic institution. If not, the student should write for information directly to the national office of the agency or foundation administering the program. A student who receives support from an outside source must notify the department immediately. The Stanford award may be adjusted.

LOANS
Graduate students who believe they will require loan assistance can apply for Federal Stafford Student Loan, Federal Perkins Loan, and University Loan programs. Inquiries regarding loan program terms can be directed to Financial Aid Office at www.stanford.edu/dept/finaid/graid.html or 520 Lasuen Mall, Old Union, Room 322, Stanford, CA 94305-3021; phone (888) FAO-3773 from outside the Bay Area and (650) 723-3058 locally. International students who are not permanent residents are not eligible for government or University long-term loans.

Application—(The following information applies to all graduate students, except those in the schools of Law and Business and in the M.D. program in the School of Medicine, who should receive information about the aid application process through their respective schools.) Graduate student loan information is available on the website above and the brochure is sent after admission; a tear off portion of that brochure may be used to request a graduate loan application packet, including detailed loan program information, forms, and instructions. Required application documents are:
1. The results of filing the Free Application for Federal Student Aid (FAFSA) with the federal processor.
2. Stanford Graduate Supplemental Application (online at www.stanford.edu/dept/finaid/gdocs.html).

Students who anticipate the need to use loan proceeds to pay Autumn Quarter bills should have their completed application filed with the FAO by the June prior to the beginning of the academic year. The FAO will notify the student of loan eligibility, which is based on a review of computed financial need, satisfactory academic progress, level of indebtedness, credit history, and availability of funds.

Debt Management—The University encourages wise debt management. Software is available to help students plan for future repayment.

Short-Term Loans—Emergency loans are available to all students with a good credit history, including international students, upon demonstration of ability to repay the loan within three months. These loans are not available to pay University bills.

COTERMINAL STUDENTS
Stanford undergraduate scholarships and grants are reserved for students in their first four years of undergraduate study at Stanford. University graduate fellowships are rarely given to coterminal students, but some departments may award research and teaching assistantships as part of the educational program to certain coterminal master’s students who are eligible for such appointments in the quarter after they have completed 180 units. Students on 50 percent assistantships register for 9 units per quarter and accrue 62 percent of a full-tuition quarter of residency; such assistantships provide a stipend and some tuition allowance. Most private and federal graduate fellowships are awarded only to students who have received the bachelor’s degree.

HONORS COOPERATIVE PROGRAM
Under a graduate cooperative program in engineering and science, employees from over 200 companies in the San Francisco Bay area are released from work, with full compensation, to attend regular classes at Stanford. Most of these companies have joined a Stanford four-channel television network that enables students to observe live lectures with talk-back privileges in their own plants. For a list of participating companies, write to the Stanford Center for Professional Development, 496 Lomita Mall/Durand Building, Stanford University, Stanford, CA 94305-4036.

VETERANS’ BENEFITS
Liaison between the University, its students, and the various federal, state, and local agencies concerned with veterans’ benefits is provided by the Office of the Registrar located in the Old Union Building. All students eligible to receive veterans’ benefits while attending the University are urged to complete arrangements with the appropriate agency well in advance of registration.
Tuition, Fees, and Housing

ASSESSMENTS

TUITION

Regular tuition for the 2000-01 academic year, payable Autumn, Winter, and Spring Quarters, is as follows:

- All departments and schools (except those below) 8,147
- Graduate Division in Engineering 8,687
- Graduate School of Business 9,632
- School of Medicine (M.D. Program) 9,902
- School of Law (payable Autumn and Spring semesters) 13,863
- J.D./M.B.A. Program (payable Autumn and Spring semesters) 14,058

Regular tuition fees apply to the undergraduate Overseas Studies and Stanford in Washington programs. For Summer Quarter tuition rates and policies, see the Stanford University bulletin, Summer Session Catalogue, 2001.

A coterminal student is subject to graduate tuition assessment and adjustment policies once graduate standing is reached. See student policies and procedures, as described under Residency and Unit Requirements in Coterminal Programs in the "Graduate Degrees" section of this bulletin.

Eligibility for registration at reduced tuition rates is described below. Tuition exceptions may also be made for illness, disability, pregnancy, new-parent relief, or other instances at the discretion of the Registrar. No reduction in tuition charges is made after the first two weeks of the quarter.

All students are strongly advised, before registering at less than the regular full-tuition rate, to consider the effects of that registration on their degree progress and on their eligibility for financial aid and awards, visas, deferment of student loans, and residency requirements.

The University reserves the right to change at any time, without prior notice, tuition, room fees, board fees, or other charges.

UNDERGRADUATE STUDENTS

During Autumn, Winter, and Spring quarters, undergraduates are expected to register at the regular full-tuition rate. Undergraduates who have completed at least twelve full-time quarters may petition to register at the 8-, 9-, or 10-unit rate for their final quarter. Undergraduate dual degree students must complete at least fifteen full-time quarters before petitioning for reduced tuition.

Permit to Attend status can be granted for one quarter on a unit-basis to those for whom it is academically appropriate. The Permit to Attend rate is $2,020 per quarter in 2000-01. Undergraduates in the terminal quarter who are completing honors theses or clearing incomplete grades may petition, on a one-time basis, for Permit to Attend for Services Only registration. That rate is $995 per quarter in 2000-01 and does not permit any course enrollment or auditing. Further information about the Permit to Attend status is available from the Registrar’s Office.

During Summer Quarter, all Stanford undergraduates may register on a unit-basis (minimum 3 units).

GRADUATE STUDENTS

Matriculated graduate students are expected to register at the full-tuition rate (11 or more units during the regular academic year) applicable to their degree program, unless they are in a category which makes them eligible to request reduced tuition.

The following reduced-tuition categories can be requested by matriculated graduate students in the final stages of their degree programs:

1. Advanced Graduate Registration (AGR): doctoral students who have been admitted to candidacy, registered for all required courses, and completed nine quarters of residency may request AGR status for 9-unit registration.

2. Terminal Graduate Registration (TGR): doctoral students who have been admitted to candidacy, completed all required courses and degree requirements other than the University oral exam and dissertation, accrued 10.5 quarters of residency, and submitted a Doctoral Dissertation Reading Committee form may request Terminal Graduate Registration status to complete their dissertations. Students pursuing Engineer degrees may apply for TGR status after admission to candidacy, completion of all required courses, and six quarters of residency. Students enrolled in master's programs may apply for TGR status upon completion of all required courses and three quarters of residency only if their program requires a final master's project.

TGR status may also be granted for one quarter only to a graduate student who is returning after a leave of absence or after reinstatement, or to graduate students who register for one final term to take a University Oral Examination, submit a thesis or dissertation, or file an Application to Graduate. Doctoral students applying for one-quarter TGR status must also meet the doctoral criteria above except that they need only nine quarters of residency. Requirements for one-quarter TGR for master's and Engineer students are as above, but master's students need not be in a program with a final writing project requirement to qualify.

Each quarter, all TGR students must enroll in the 801 (for master's and Engineer students) or 802 (for doctoral students) course in their department for zero units, in the appropriate section for their adviser. After the first TGR quarter, this enrollment will be conducted by the Registrar's Office if the TGR student is registered by the Friday before the study list deadline and if the TGR student has an 801 or 802 enrollment in a previous quarter. Enrollments will not be created for the TGR student who is attending a professional school. TGR students register at a special tuition rate: $995 in 2000-01. Within certain restrictions, TGR students may enroll in additional courses, at the appropriate unit rate.

3. Graduate Final Requirement Registration: graduate students who need only a few remaining units to complete degree requirements or to qualify for TGR status, may register for one quarter on a unit basis (3 to 8 units) to cover the deficiency. This status may be used only once during a degree program.

Additional information on these registration categories is available from the Degree Progress Office in the Old Union.

Matriculated graduate students who have Stanford fellowships or assistantships that require less than full-tuition registration may register at the unit rate required by their award. Honors Cooperative students register at the unit rate.

During the Autumn, Winter, and Spring quarters, matriculated graduate students in most departments may register at the 8-, 9-, or 10-unit rate if their enrollment plans are accepted by their departments. Students in the departments of Applied Physics, Mathematics, and Statistics, because of department affiliation with the Honors Cooperative program, are not eligible to register at less than the full-tuition rate, unless they are eligible for one of the special categories above or a departmentally-approved exception. Students in the School of Engineering may register at the 9-unit rate. Students in the schools of Law and Business, or the M.D. program in the School of Medicine, should consult appropriate school officers about tuition reduction eligibility.

Tuition exceptions may also be available for students who are faculty spouses, regular Stanford employees, or full-time educators in the Bay Area.

During Summer Quarter, most matriculated graduate students may register on the unit basis for 3 or more units. Students in schools and departments affiliated with the Honors Cooperative program, as listed above, may not register below the 12-unit rate (9-unit minimum in Statistics only).

Nonmatriculated graduate students pay the same tuition rates as matriculated students, but must register at the 8-unit rate or above. Postdoctoral scholars who are registered as students and visiting researchers
do not enroll in courses and pay the TGR rate. Within certain restrictions, postdoctoral students may enroll in courses if the appropriate unit rate for tuition is paid.

INTERNATIONAL STUDENTS

F1 or J1 visas are required by the U.S. Immigration and Naturalization Service. International students must be registered as full-time students during the academic year. Summer Quarter registration is not required. International graduate students comply with immigration regulations while enrolled for partial tuition if their Stanford fellowships or assistantships require part-time enrollment, if they are in AGR or TGR status, or if they are in the final quarter of a degree program. Nonmatriculated international students must register for at least 8 units.

FEES

APPLICATION FEE

Contact the Undergraduate Admissions Office for information about the undergraduate application fee and the Graduate Admissions section of the Registrar's Office for the current graduate application fee. Application fees for the School of Law, the School of Medicine, and the Graduate School of Business vary by program. Fees are payable at the time of application and are not refundable.

ASSU FEES

The Associated Students of Stanford University (ASSU) fees are established by student vote in Spring Quarter. Fees directly fund activities of student organizations and not operations of ASSU. The 2000-01 fees are:

Undergraduates—Autumn, $62; Winter, $57; Spring, $62
Graduates—Autumn, $23; Winter, $24; Spring, $25
Law—Autumn, $23; Spring, $49

Fees are assessed each term. All fees are refundable. Refunds can be requested during the first three weeks of each quarter per instructions advertised in the Stanford Daily. Those eligible are mailed refund checks by the eighth week of the quarter or receive credit on their University bill.

DOCUMENT FEE

Stanford charges a one-time Document Fee to all students admitted to new degree or non-degree programs in 1993 or later. The fee is paid once only, regardless of the number of degrees a student may ultimately pursue. It covers the cost of a variety of University administrative services such as enrollment and degree certification, course drops and adds, diplomas, and official transcripts and their production.

HEALTH INSURANCE FEE

The University requires all registered students to carry medical insurance to provide coverage for services not provided by Cowell Student Health Services. Students are enrolled in and charged for the Stanford student health insurance plan, unless they have completed waiver procedures by the second day of instruction. Those who carry medical insurance through an alternate carrier are generally eligible for waiver of the health insurance fee.

SPECIAL FEES

New Student Orientation Fee—A fee is charged to all entering undergraduates for the costs of orientation, including room and board, and for the cost of class dues to provide funds for later activities of the class.

School of Law Course Materials Fee—A fee is charged each semester to School of Law students for supplementary course materials. Late Fees—Charges are imposed for late registration and late submission of study lists. Amounts are listed in the quarterly Time Schedule.

Laboratory Fee—Students in chemistry laboratory courses are charged a nonrefundable fee.

Music Practice; Athletics, Physical Education, Recreation; and Dance—Courses for which special fees are charged are indicated in the Time Schedule.

Dissertation Fee—Each Ph.D., D.M.A., and Ed.D. candidate is charged a fee to cover the cost of microfilming and binding the dissertation and the cost of publishing the abstract.

International Scholar Service Fee—A one-time fee for Visa authorization documents is charged to international postdoctoral and visiting scholars.

Vehicle Registration Fee—Students must register their motor vehicles with the campus Department of Public Safety. Parking permits may be purchased at Parking and Transportation, 855 Sierra Street.

HOUSING

Bulletins with further information on housing rates are Summer Session Catalogue, 2001, for Summer Quarter; School of Law for School; Overseas Studies for Overseas Centers.

Campus housing rates are generally below local area market rents. The approximate room rates for the 2000-01 academic year are as follows:

<table>

</tbody>
</table>

* All rates are approximate and subject to minor changes.

All rates are per student. Room rates are charged quarterly on the University Bill. Information on payment options and procedures is discussed in housing assignment information from Housing Assignment Services and is available in complete detail from the Bursar's Office, Old Union, Room 105, Stanford University, Stanford, CA 94305.

A quarterly house dues fee for students is generally determined by the local staff and/or residents of the house and may be included with room and board charges on the University Bill.

MEAL PLANS*

Meal plan rates are as follows for the 2000-01 academic year:

<table>
<thead>
<tr>
<th>Meal Plans</th>
<th>Quarterly Rates</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Traditional&quot; Meal Plans (all-you-can-eat): for residents of Braner, Lagonita, Florence Moore, Roble, Sterling Quad, Stern, and Wilbur</td>
<td></td>
</tr>
<tr>
<td>19 meals/week</td>
<td>$1,437</td>
</tr>
</tbody>
</table>
PAYMENTS

All charges and credits from offices within the University are aggregated in a student's individual account and presented on the University Bill. The bill may include tuition, housing, food service, ASSU fees (special student-approved association fees set by the ASSU), health insurance, and any miscellaneous charges incurred such as music lessons, cleaning, or re-keying charges. All amounts are due and payable upon receipt of the University Bill, but term-based charges (that is, tuition, room and board, ASSU, and health insurance fees) are always due by the day before term classes begin, whether or not a correct bill has been received. If term-based charges are added after the start of the term, they must be paid within 24 hours of the add date to avoid late fees. A miscellaneous charge will be subject to late fees 30 days after the first bill for it has been issued.

A Student Account (and its associated University Bill) may be paid with personal check (drawn on U.S. banks in U.S. funds), cash, scholarships, loan proceeds (for example, Perkins, Stafford, or University-is-issued), or proceeds of loans to parents (for example, CLAS, PLUS). Payments must be made in a form acceptable to the University. Shortfalls from any of the above categories may be made up in whole or in part from the University's Deferment Loan Program (described below) for matriculated students. The University does not accept credit card payments.

LATE PAYMENT

All charges recorded in a Student Account must be paid by 5 p.m. on the day preceding the first day of instruction whether or not a bill has been received. Payment made on a Student Account after that date is subject to an additional charge in accord with the following fee schedule:

<table>
<thead>
<tr>
<th>Amount</th>
<th>Late Fee</th>
</tr>
</thead>
<tbody>
<tr>
<td>$25</td>
<td>if payment is made on or after the first day of instruction, but during the first week of the term</td>
</tr>
<tr>
<td>$40</td>
<td>if payment is made during the second week of the term</td>
</tr>
<tr>
<td>$55</td>
<td>if payment is made during the third week of the term</td>
</tr>
<tr>
<td>$75</td>
<td>if payment is made during the fourth week of the term</td>
</tr>
<tr>
<td>$100</td>
<td>if payment is made during the fifth week of the term</td>
</tr>
<tr>
<td>$125</td>
<td>if payment is made during the sixth week of the term or later</td>
</tr>
</tbody>
</table>

* All rates are approximate and subject to change.

† An administrative fee is withheld from the a la carte dollars given to spend. Up to $50 in a la carte points may be carried over each quarter until Spring Quarter.

DEFERMENT LOAN PROGRAM

Deferment Loans (also known as "deferments") are short-term loans and are available to matriculated students at the beginning of each term. The proceeds from a Deferment Loan may only be used to pay current term fees. The Deferment Loan may be used to avoid the application of Late Payment Fees described above. The terms of the Deferment Loan are:

1. $20 Deferment Loan Application Fee.
2. An annual interest rate of 10 percent assessed on the Deferment Loan principal until the date payment is received or until the due date, whichever comes first, in accord with the following schedule:

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Deferment Due Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Autumn</td>
<td>November 10, 2000</td>
</tr>
<tr>
<td>Winter</td>
<td>February 22, 2001</td>
</tr>
<tr>
<td>Spring</td>
<td>May 17, 2001</td>
</tr>
<tr>
<td>Summer</td>
<td>July 25, 2001</td>
</tr>
</tbody>
</table>

3. Any portion of the amount of the loan may be prepaid before the due date without prepayment penalty.
4. Amounts remaining unpaid after the due date are delinquent and subject to a late charge of $25.00, and additional interest at the maximum rate permitted by California law (including California Financial Code §28000), or such lesser rate as the University may determine, in its sole discretion, from the due date until paid.

DELINQUENT ACCOUNTS

Delinquent accounts (such as for tuition, fees, housing, meal plans, or for other amounts owed to the University) are reported to the Registrar’s Office, which places a "hold" on the student’s further registration and on the release of transcripts and diplomas until the past-due accounts have been paid. In addition, delinquent accounts may be reported to one or more national credit bureaus and/or commercial collection agencies.

REFUNDS

TUITION

Students who withdraw from the University before the end of a term may receive refunds of portions of their tuition as described below.

ANNULLED REGISTRATION

Students who withdraw from the University voluntarily on or before the first day of instruction may have their registrations annulled. Tuition is refunded in full. Such students are not included in University records as having registered for the term and new students will not secure any privileges for admission for any subsequent quarter as returning students. An annulment does not automatically cancel health coverage unless the annulment is granted by the first day of instruction. Financial aid recipients should be aware that a proportion of any refund is returned to the various sources of aid.

CANCELLATION OF REGISTRATION OR SUSPENSION FOR CAUSE

Students who have their registrations canceled or are suspended from the University for cause receive refunds on the same basis as those receiving leaves of absence unless otherwise specified in the disciplinary action taken. A student whose registration is canceled less than one week after the first day of instruction for an offense committed during a preceding quarter receives a full refund of tuition fees.

INSTITUTIONAL INTERRUPTION OF INSTRUCTION

It is the University’s intention to do everything possible to avoid taking the actions described in this paragraph. However, should the University determine that continuation of some or all academic and other campus activities is impracticable, or that their continuation involves a high degree of physical danger to persons or property, activities may be curtailed and students requested or required to leave the campus. In such an
event, arrangements will be made as soon as possible to offer students the opportunity to complete their courses, or substantially equivalent work, so that appropriate credit may be given. Alternatively, the University may determine that students will receive refunds on the same basis as those receiving leaves of absence, or on some other appropriate basis.

LEAVE OF ABSENCE

A student in good standing who withdraws from the University after the first day of instruction, but before the end of the first 60 percent of the quarter, may file a petition for a leave of absence and tuition refund with the Registrar’s Office. A leave of absence after the first 60 percent of the quarter is only granted for approved health and emergency reasons. Students granted a leave of absence are shown on the University transcript as having registered for the term. Courses in which the student was enrolled after the drop deadline will appear on the student’s record and will show the grade of ‘W’ (withdrawn). Undergraduates who take a leave while in good standing may enroll in the University for a subsequent quarter with the privileges of a returning student. Graduate students are subject to special registration requirements (see Leave of Absence in the “Graduate Degrees” section of this bulletin).

TUITION REFUND SCHEDULE

Students who take a leave of absence are eligible for a tuition refund during the first 60 percent of the quarter. Refunds are calculated on a per diem basis (including weekends and University holidays) starting the first day of instruction of each quarter. Tuition will be charged on a daily basis (including weekends and holidays) through the first 60 percent of the quarter. After the first 60 percent of the quarter, students are liable for the full amount of tuition that they were charged.

</tbody>
</table>

For example: you are an undergraduate student who was charged the standard tuition rate of $8,147 for Autumn Quarter. You become ill and inform the Registrar’s Office on the 17th day of the quarter that you want to take a leave of absence. You will be charged for 17 days of tuition ($102 x 17 days) or $1,734.

Separate schedules exist for students paying the medical, law, graduate business, or summer session rates. These schedules are available at the Registrar’s Office and via http://www.stanford.edu/dept/registrar/registration.

Tuition refunds are calculated based on the date that the student informed the Registrar’s Office in person, by mail, or by e-mail, of his or her intention to take a leave of absence. If the student is incapacitated and thus not able to contact the Registrar’s Office, the date of the leave of absence is the date on which the Registrar’s Office was informed of the student’s incapacity by the student’s parents or other close relative or partner, or by an official in one of the following University offices: the Dean of Students, Residential Education, Cowell Student Health, Housing Assignment Services, Financial Aid, the Vice Provost for Undergraduate Education, the Vice Provost for Student Affairs, an academic dean’s office, or an academic department.

ROOM AND MEAL PLAN REFUNDS

Students assigned to a University residence are subject to the conditions of the University Residence Agreement. Under this agreement, single students and couples without children are required to live somewhere in the University residence system for the entire academic year. Students with children may give notice of termination of occupancy for the end of each academic term. Room refunds are made only when students move out of the residence system and withdraw from the University. Students in all-male fraternities or all-female sororities are billed directly by the fraternity or sorority, and refunds are arranged between the student and the fraternity or sorority.

A meal plan refund is based on the date when a student moves out of his or her University residence. If a student uses the meal plan after that date, an additional daily charge will incur.

Any decision to refund prepaid room and meal plan charges or to waive liability for deferred charges shall ultimately be made at the sole discretion of the University. Students with questions about refunds should contact Housing Assignment Services (for room refunds) or the central office of University Dining Services (for meal plan refunds).

HOUSING

University housing is available to registered Stanford students. Planning of educational programs, counseling and crisis intervention by residence deans, and administration of residence offices is coordinated by the department of Residential Education and Graduate Residences (http://rescomp.stanford.edu/resed.html), or telephone (650) 725-2800.

Dining services and custodial services and maintenance are provided by Student Housing and Dining Services (http://www.stanford.edu/dept/hds/), or telephone (650) 723-2287.

Information on University housing assignments, options, policies, application procedures, and deadlines, as well as community housing services, may be obtained from Housing Assignment Services, Old Union, Room 214, Stanford University, Stanford, CA 94305-3012, or telephone (650) 725-2810.

UNDERGRADUATE STUDENT RESIDENCES

RESIDENTIAL EDUCATION PROGRAM

The program in Residential Education provides for undergraduates certain dimensions of a college experience within a large research university. The essential conviction behind the Stanford residence program is that formal teaching, informal learning, and personal support in residences play an important role in a Stanford education. Residential Education programs extend the classroom into the residences and complement the academic curriculum with activities and experiences that contribute to students’ preparation for a life of leadership, intellectual engagement, citizenship, and service.

ASSIGNMENT TO UNDERGRADUATE RESIDENCES

Approximately 93 percent of undergraduates live in University housing (excepting students studying abroad during the academic year). All freshmen are required to live in University residences for educational reasons and are automatically assigned housing following admission. Residence assignments for continuing undergraduates are made on the basis of an annual lottery (called the Draw) and quarterly waiting lists. Undergraduates who enter Stanford as freshmen are guaranteed four years of University housing if they apply by the appropriate Draw deadlines and are willing to live anywhere on campus. Transfer students are guaranteed two or three years of housing, based on their entering class standing. For further information concerning housing eligibility, contact Housing Assignment Services.

Undergraduate residences include traditional dormitories, academic theme, cross cultural and focus houses, ethnic theme houses, student-managed and cooperative houses, apartments, suites, fraternities, and sororities.

GRADUATE STUDENT RESIDENCES

RESIDENCE PROGRAM

The University’s philosophy of graduate student housing is based on the premise that supporting high quality graduate scholarship and research is central to the mission of the University. By providing affordable housing in proximity to academic resources, the University creates an environment conducive to research and intellectual dialogue among students, their peers, and faculty members.
ASSIGNMENT TO GRADUATE RESIDENCES

Approximately 46 percent of matriculated graduate students at the home campus live in University housing. Residence assignments are made on the basis of an annual lottery and quarterly waiting lists. New matriculated single students and couples without children who apply for housing by the Lottery deadline and are willing to live in any residence for which they are eligible are guaranteed housing their first year at Stanford. New matriculated master's students with children who apply by the Lottery deadline are assured two years of on-campus housing while registered, and new matriculated doctoral students with children who apply by the Lottery deadline are assured six years of on-campus housing while registered. At Stanford University, new matriculated students are students who are in a graduate program for the first time. Students starting a second graduate degree are not considered new matriculated students and therefore are not guaranteed housing.

Single graduate students may request assignment to graduate apartments and dormitories, or to spaces in six undergraduate cooperative houses.

One-, two-, three-, and four-bedroom apartments are provided for couples without children and students with children, both graduate and undergraduate, based on student status and the number of dependents. Couple housing is available to students who are married and to students who have a same-sex or opposite-sex domestic partner. At Stanford University, a domestic partnership is defined as an established, long-term partnership with an exclusive mutual commitment in which the partners share the necessities of life and ongoing responsibility for their common welfare. Housing for students with children is available to married couples, domestic partners, and single parents who have dependent children living with them. Housing is not provided for extended families, including the parents and siblings of students, or live-in day care staff.

COMMUNITY HOUSING

Community Housing Services maintains computerized listings of private rooms, houses, and apartments in surrounding communities that are available to students desiring to live off campus. Students must make rental arrangements directly with landlords. Information and publications on community housing may be obtained from Community Housing Services, Old Union, Room 214, Stanford University, Stanford, CA 94305-3012, or telephone (650) 723-3906. During early September, temporary accommodations are available in a student dormitory at a modest charge for students searching for off-campus housing for Autumn Quarter. Contact Summer Conference Services for more information at (650) 725-1429.

RESIDENCE DEANS

Residence Deans provide assistance to on- and off-campus students. They can advise students about academic and personal matters, occasionally intervene directly in behavioral problems/mental health concerns, and assist with personal emergencies. Advice is also available on issues of academic probation or suspension, leaves of absence, special concerns of women or minorities, and administrative matters. Residence Deans work closely with the Dean of Students and other University offices. They are assigned to specific residences and to off-campus students; for further information, call Residential Education at (650) 725-2800.
Undergraduate Degrees

DEGREE PROGRAMS

BACHELOR OF ARTS (A.B.), BACHELOR OF SCIENCE (B.S.)

Stanford University confers the degree of Bachelor of Arts (A.B.) or the degree of Bachelor of Science (B.S.) on those candidates who have been recommended by the Committee on Academic Appraisal and Achievement (C-AAA), who have applied in advance for conferment of the degree, and who have fulfilled the following requirements:

1. A minimum of 180 units of allowable University work. (As described below, units above the allowable limits for activity courses and for courses taken on a satisfactory/no credit basis cannot be counted towards the 180 minimum.)

2. The Writing, General Education, and Language Requirements (see below).

3. Curricular requirements of at least one major department or program and the recommendation of the department(s). (Descriptions of curricular and special degree requirements are included in each department's section of this bulletin.)

4. A minimum of 90 units (including the last 15) at Stanford. In special cases, students who have earned at least 135 units in resident work and who have completed the Writing, General Education, and Language Requirements, as well as all major requirements, may petition for a waiver of the last 15 units-in-residence requirement.

Stanford confers the Bachelor of Science degree on candidates who fulfill these requirements in the School of Earth Sciences, in the School of Engineering, or in the departments of Applied Physics, Biological Sciences, Chemistry, Mathematics, or Physics in the School of Humanities and Sciences. The University also awards B.S. degrees to candidates in the Program in Science, Technology, and Society; in the Program in Symbolic Systems; and, when appropriate, in the Program for Individually Designed Majors. Candidates who fulfill these requirements in other schools or departments receive the Bachelor of Arts degree.

Students who complete the requirements for two or more majors which ordinarily would lead to the same degree (A.B. or B.S.) should review "The Major" section of this bulletin to ensure that they have an understanding of the requirements for multiple or secondary majors.

BACHELOR OF ARTS AND SCIENCE (B.A.S.)

The University confers the degree of Bachelor of Arts and Science (B.A.S.) on candidates who have completed, with no overlapping courses, the curricular requirements of two majors which ordinarily would lead to different bachelor's degrees (that is, a Bachelor of Arts degree and a Bachelor of Science). These students must have applied in advance for graduation with the B.A.S. degree instead of the A.B. or B.S. degree, been recommended by the C-AAA, and have fulfilled requirements 1, 2, and 4 above in addition to the requirements for multiple majors.

Students who complete the requirements for both majors without overlapping courses are not eligible for the B.A.S., but may apply to have a secondary major recorded on their transcripts. (See "The Major" section below.)

DUAL BACHELOR'S DEGREES (CONCURRENT A.B. AND B.S.)

A Stanford undergraduate may work concurrently toward both an A.B. and a B.S. degree. To qualify for both degrees, a student must complete:

1. A minimum of 225 units of University work. (As described below, units above the allowable limits for activity courses and for courses taken on a satisfactory/no credit basis cannot be counted towards the 225 minimum.)

3. The curricular requirements of two majors (one of which leads to a Bachelor of Arts degree and the other to a Bachelor of Science degree).

4. A minimum of 135 units (including the last 15) at Stanford. In special cases, as described above, students may petition for waiver of the last 15 units-in-residence requirement.

A student interested in dual bachelor's degrees should file a statement of intention with the Registrar's Office no later than two quarters in advance of completing the program. The statement should be submitted on a standard petition form along with recommendations of appropriate representatives from the two departments whose major requirements the student is expecting to fulfill.

Students who do not meet the higher unit and residence requirements of the dual degree option may be eligible instead for the B.A.S. degree as described above.

SECOND BACHELOR'S DEGREE

Stanford does not award a second Bachelor of Arts degree to an individual who already holds a Bachelor of Arts, nor a Bachelor of Science degree to an individual who already holds a Bachelor of Science degree. However, the holder of a Bachelor of Arts degree from Stanford may apply to the Subcommittee for Exceptions to Academic Policy for admission to candidacy for a Bachelor of Science degree, and the holder of a Bachelor of Science degree from Stanford may apply for candidacy for a Bachelor of Arts degree. A recommendation of the major department for the second bachelor's degree must accompany the application.

Generally, a student may not apply for a second bachelor's degree after having been a graduate student, although a student may submit a petition for exception. The Office of the Registrar's Academic Standing section in the Old Union, room 141, reviews these petitions. A student approved for this program may register as an undergraduate and is subject to the usual rules and regulations affecting undergraduates. Requirements for a second Stanford bachelor's degree are the same as those described above for dual bachelor's degrees.

COTERMINAL BACHELOR'S AND MASTER'S DEGREES

The coterminal degree program allows undergraduates to study for a master's degree while completing their bachelor's degree(s) in the same or a different department. Undergraduates with strong academic records may apply for admission to a coterminal master's program as early as the eighth quarter (or upon completion of 105 units) but no later than early in the 11th quarter of undergraduate study, and at least four quarters in advance of the anticipated date of conferral of the master's degree. Units completed during summer quarters, as well as undergraduate transfer credit, are also counted towards quarters of undergraduate study. Students who wish to apply for a master's program after these deadlines must apply through the regular graduate admissions process.

To apply for admission to a coterminal master's program, students must submit to the prospective graduate department the following: coterminal application, statement of purpose, preliminary program proposal, two letters of recommendation from Stanford professors, and a current Stanford transcript. Graduate Record Examination (GRE) scores or other requirements may be specified by the prospective department.

For coterminal students, the quarter following completion of 180 units (or 225 units for dual undergraduate degree students) is identified as the first graduate quarter. Beginning with this quarter, coterminal students are subject to graduate student policies and procedures, as described in the "Graduate Degrees" section of this bulletin. These policies include continuous registration or leave of absence for quarters not enrolled (rather than the stopping out procedure for undergraduates) and minimal progress guidelines.

In the first graduate quarter, a coterminal student is assigned an adviser in the master's department for assistance in planning a program of study to meet the requirements for the master's degree. The plan is outlined on the Program Proposal for a Master's Degree, which is approved
by the master's department by the end of the first graduate quarter. Authorizations for master's programs expire three calendar years from the first graduate quarter. An extension requires review of academic performance by the department.

The specific University residency, unit requirement, and additional policies for a bachelor's/master's program are described under Residency and Unit Requirements in Coterminal Programs in the "Graduate Degrees" section of this bulletin.

Conferral of each degree is applied for separately by the deadlines given in the University Time Schedule. The master's degree must be conferred simultaneously with, or after, the bachelor's degree.

DEGREE REQUIREMENTS

A LIBERAL EDUCATION

As do all major universities, Stanford provides the means for its undergraduates to acquire a liberal education—an education that broadens the student's knowledge and awareness in each of the major areas of human knowledge, that significantly deepens understanding of one or two of these areas, and that prepares him or her for a lifetime of continual learning and application of knowledge to career and personal life.

The undergraduate curriculum at Stanford allows considerable flexibility. It permits each student to plan an individual program of study that takes into account personal educational goals consistent with particular interests, prior experience, and future aims. All programs of study should achieve some balance between depth of knowledge acquired in specialization and breadth of knowledge acquired through exploration. Guidance as to the limits within which that balance ought to be struck is provided by the University's General Education Requirements and by the requirements set for major fields of study.

These educational goals are achieved through study in individual courses that bring together groups of students examining a topic or subject under the supervision of scholars. Courses are assigned credit units. To earn a bachelor's degree, the student must complete at least 180 allowable units and, in so doing, also complete the Writing Requirement, the General Education Requirements, the Language Requirement, and the requirements of a major.

The purpose of the Writing Requirement is to promote effective communication by ensuring that every undergraduate can write clear and effective English prose. Words are the vehicles for thought, and clear thinking requires facility in writing and speech.

The Language Requirement ensures that every student gains a basic familiarity with a foreign language. Foreign language study extends the student's range of knowledge and expression in significant ways, providing access to materials and cultures that otherwise would be out of reach.

The General Education Requirements provide guidance toward the attainment of breadth and stipulate that a significant share of a student's work must lie outside an area of specialization. These requirements ensure that every student is exposed to different ideas and different ways of thinking. They enable the student to approach and to understand the important "ways of knowing" to assess their strengths and limitations, their uniqueness, and, no less important, what they have in common with others.

Depth, the intensive study of one subject or area, is provided through specialization in a major field. The major relates more specifically to a student's personal goals and interests than do the general requirements outlined above. Stanford's curriculum provides a wide range of standard majors through its discipline-oriented departments, a number of interdisciplinary majors in addition to department offerings, and the opportunity for students to design their own major programs.

Elective courses, which are not taken to satisfy requirements, play a special role in tailoring the student's program to individual needs. For most students, such courses form a large portion of the work offered for a degree. Within the limitations of requirements, students may freely choose any course for which previous studies have prepared them.

Following are more detailed descriptions of these various requirements and the rationales upon which they are based.

THE WRITING REQUIREMENT

All instructors expect that students will express themselves effectively in speech and writing. The Writing Requirement helps students meet that expectation.

All candidates for the bachelor's degree, regardless of the date of matriculation, must satisfy the requirement. Transfer students are individually informed at matriculation of their status with regard to the requirement.

The Writing Requirement was revised for undergraduates who entered Stanford in Autumn 1996 and thereafter. In addition to the requirement detailed below for completion of the first-year courses, these students must complete a writing-intensive course in their major. Courses available to fulfill the Writing in the Major Requirement (WIM) are designated under individual department listings. All undergraduates must satisfy the first-year course(s) requirement in one of four ways:

1. English 1-2, a two-quarter sequence of composition courses. (Note: a few students who demonstrate sufficient skill in the first quarter of the English 1-2 sequence will be exempted from English 2 upon certification by the instructor.)
2. English 3, an intensified one-quarter course open only to students with a score of 4 or 5 on the CEEB Advanced Placement Test in English.
3. Special writing instruction in connection with the Area One Requirement.
4. Approved transfer credit.

A complete list of courses is distributed to all entering undergraduates and is also available at the Writing and Critical Thinking office.

Courses available to fulfill the first-year Writing Requirement are designated (W) in this bulletin.

THE GENERAL EDUCATION REQUIREMENTS

PURPOSE

The General Education Requirements are an integral part of undergraduate education at Stanford. Their purpose is two-fold: to introduce students to a broad range of fields and areas of study within the humanities, social sciences, natural sciences, applied sciences, and technology, and to help students prepare to become responsible members of society. Whereas the concentration of courses in the major is expected to provide depth, the General Education Requirements have the complementary purpose of providing breadth to a student's undergraduate program. The requirements are also intended to introduce students to the major social, historical, cultural, and intellectual forces that shape the contemporary world.

Fulfillment of the General Education Requirements in itself does not provide a student with an adequately broad education any more than acquiring the necessary number of units in the major qualifies the student as a specialist in the field. The major and the General Education Requirements are meant to serve as the nucleus around which the student is expected to build a coherent course of study by drawing on the options available among the required and elective courses.

Information regarding specific courses that have been certified to fulfill the General Education Requirements, and regarding a student's status in meeting these requirements, is available at the Office of the Registrar. Course planning and advising questions related to the General Education Requirements should be directed to the Undergraduate Advising Center.

It is the responsibility of each student to ensure that he or she has fulfilled the requirements by checking in Axess within the Undergraduate Progress function or by checking with the Office of the Registrar. This should be done at least two quarters before graduation.

Students should be extremely careful to note which set of General Education Requirements apply to them. The date of matriculation at Stanford determines which requirements apply to an individual student.
CURRENT SYSTEM

To fulfill the General Education Requirements (GER), undergraduates who entered Stanford in Autumn Quarter 1996 and thereafter must complete a minimum of nine courses certified for this purpose in four areas as follows:

**Area 1 Program**—Introduction to the Humanities courses (one-quarter introductory courses followed by two-quarter thematic sequences)

- Students are expected to satisfy the Area One Requirement during their freshman year.

**Area 2: Natural Sciences, Applied Science and Technology, and Mathematics**—Students can fulfill this requirement in two different ways:
  1. By completing one of the integrated three-course Science, Mathematics, and Engineering Core sequences, or
  2. By completing three certified GER courses in this area, with no more than two of these courses from the same subarea.

**Area 3: Humanities and Social Sciences**—Students are required to complete three certified GER courses in this area with at least one course in the humanities subarea and one in the social sciences subarea.

**Area 4: World Cultures, American Cultures, and Gender Studies**—While satisfying requirements for areas 1 or 3, or by taking additional courses, students must complete at least one certified GER course in two of the three subareas.

Courses certified as meeting the General Education Requirements must be taken for a letter grade and a minimum of 3 units of credit. A single course may be certified as fulfilling one subarea within the General Education Requirements; the one exception is that a course may be certified to fulfill an Area 4 subarea in addition to an Area 3 subarea.

Courses that have been certified as meeting the requirements are identified throughout this bulletin with the notational symbols listed below.

A comprehensive list of certified courses also appears as an Appendix to this bulletin.

**Area 1 Program**

- GER 1a: first-quarter course
- GER 1b: second-quarter course
- GER 1c: third-quarter course

**Area 2: Natural Sciences, Applied Science and Technology, and Mathematics**

- GER 2: three-quarter Science, Mathematics, and Engineering core sequence
- GER 2a: Natural Sciences subarea
- GER 2b: Applied Science and Technology subarea
- GER 2c: Mathematics subarea

**Area 3: Humanities and Social Sciences**

- GER 3a: Humanities subarea
- GER 3b: Social Sciences subarea

**Area 4: World Cultures, American Cultures, and Gender Studies**

- GER 4a: World Cultures subarea
- GER 4b: American Cultures subarea
- GER 4c: Gender Studies subarea

**CREDIT TRANSFER**

While courses taken in fulfillment of the General Education Requirements should be taught by Stanford faculty members who are Academic Council members or Senior Lecturers, students may propose that work taken at another college or university be accepted in fulfillment of a General Education Requirement. In such cases, the Office of the Registrar's Credit Evaluation staff determines, after appropriate faculty consultation, whether the work is comparable to any of the specifically certified courses or course sequences.

**UNDERGRADUATES WHO ENTERED PRIOR TO AUTUMN 1996**

Stanford has a long tradition of ensuring curricular breadth through some system of requirements, variously described as "distribution requirements," "general studies requirements," or "general education requirements." A student returning to Stanford to complete an interrupted degree program may satisfy either the distribution program in place at the time of matriculation or the current program of requirements. Such a student should consult the Stanford Bulletin or its predecessors appropriate to the original entrance year or seek the advice of the Undergraduate Degree Coordinator, room 132, Old Union. Students completing requirements in effect 1991 or later may find the Appendix to this bulletin helpful in planning work.

**THE LANGUAGE REQUIREMENT**

To fulfill the Language Requirement, undergraduates who entered Stanford in Autumn 1996 and thereafter are required to complete one year of college-level study or the equivalent in a foreign language. Students may fulfill the requirement in any one of the following ways:

1. Complete three quarters of a first-year language course at Stanford or the equivalent at another recognized post-secondary institution.
2. Score 4 or 5 on the Advanced Placement (AP) test in a language other than English.
3. Achieve a satisfactory score on the SAT II Subject Tests in the following languages:
   - Chinese 630 Italian 630
   - French 640 Japanese 620
   - German 630 Latin 630
   - Hebrew 540 Spanish 630
4. Take a diagnostic test in a particular language which either:
   a) Places them out of the requirement, or
   b) Diagnoses them as needing one, two, or three additional quarters of college-level study. Students fulfilling the requirement can then be permitted either by passing the required number of quarters of college-level language study at Stanford or the equivalent elsewhere, or by retaking the diagnostic test at a later date and placing out of the requirement.

Written placements are offered on-line throughout the summer in Chinese, French, German, Japanese, Russian, Spanish, and Spanish for home background speakers.

**CREDIT**

**ADVANCED PLACEMENT**

Stanford University allows up to 45 units of credit toward graduation for work completed in high school as part of the College Entrance Examination Board (CEEB) Advanced Placement curriculum. The awarding of such credit is based on CEEB Advanced Placement test scores and is subject to University and department approval.

The faculty of a given department determines whether any credit toward the 180-unit requirement can be based on achievement in the CEEB Advanced Placement Program in their discipline. Stanford departments electing to accept the Advanced Placement (AP) credit are bound by these University policies:

1. Credit is usually granted for an AP score of 4 or 5. Usually, 10 quarters are awarded (but occasionally fewer than 10). No more than 10 quarter units may be given for performance in a single examination. If the student has scores of 4 or 5 on two exams within the same language (for example, French Language and Literature), or within the same subject (for example, Music Theory and Music History), the
student is given a maximum total of 10 quarter units based on only one of the scores—the higher of the two, if different. The Studio Art and Art History examinations are treated separately and yield 10 quarter units each for scores of 4 or 5.

2. Whether credit is to be given for an AP score of 3 is a matter for departmental discretion; up to 10 units may be awarded.

3. No credit may be authorized for an AP score lower than 3.

Performance on an AP exam can indicate the appropriate placement for continuing course work in that subject at Stanford. Students may not enroll in courses at Stanford for which they received equivalent credit through the AP program. The chart below shows the current AP credit and placement policies. Further information is available from the Office of the Registrar's Transfer Credit Evaluator, room 141, Old Union.

</table>

* Students may skip Computer Science 106A, B and X and complete Computer Science 103, 107, or 109 to receive an additional 5 quarter units.

† A minimum score of 4 on both tests will receive 5 units.

ACTIVITY COURSES

For undergraduates who entered Autumn 1996 and thereafter, a maximum of 8 units of credit earned in activity courses, regardless of the offering department or if accepted as transfer units, count towards the 180 (225 if dual degrees are being pursued) units required for the bachelor's degree. All activity courses are offered on a satisfactory/no credit basis.

Undergraduates who entered Stanford between Autumn 1986 and the end of the 1995-96 academic year may apply a maximum of 12 units in activity courses (Physical Education or Music Activity) to the 180/225 unit requirement for graduation.

COURSES TAKEN ON SATISFACTORY/NO CREDIT OR CREDIT/NO CREDIT BASIS

For undergraduates who entered Autumn 1996 and thereafter, a maximum of 36 units of credit taken at Stanford or its overseas campuses for a "CR" or "S" grade may be applied towards the 180 (225 if dual degrees are being pursued) units required for the bachelor's degree. For those who entered Stanford as transfer students in Autumn 1996 and thereafter, the maximum is 27 units.

Departments may also limit the number of satisfactory or credit courses accepted towards the requirements for a major. Satisfactory/credit courses applied towards a minor may be similarly limited. Courses not letter-graded are not accepted in fulfillment of the General Education Requirements applicable to undergraduate students who entered Stanford in Autumn 1996 and thereafter. Writing in the Major courses are usually offered letter grade only. In those instances where the course is offered for a letter grade or CR/NC, the course must be taken for a letter grade.

INTERNSHIP GUIDELINES

Undergraduate internships should not by themselves carry any credit. However, an individual student may arrange with a faculty member for a research or other academic project to be based on the internship. Arrangements between students and faculty regarding credit are expected to be made well in advance of the internship. Credit should be arranged within departmental rules for directed reading or independent study and should meet the usual department standards.

TRANSFER WORK

Academic credit for work done elsewhere will be allowed toward a Stanford bachelor's degree under the following rules and conditions:

1. Credit may be granted for work completed at institutions in the U.S. only if the institutions are accredited.

2. Study in institutions outside the U.S., when validated by examination results, tutorial reports, or other official evidence of satisfactory work, may be credited toward a Stanford bachelor's degree, subject to the approval of the credit evaluator and the appropriate departments.

3. Credit is officially allowed only after the student has been unconditionally admitted to Stanford.

4. Credit is allowed for work completed at institutions in the U.S. only on the basis of an official transcript received by the Registrar at Stanford directly from the institution where the credit was earned.

5. Credit from another institution will be transferred for courses which are substantially equivalent to those offered at Stanford University on the undergraduate level, subject to the approval of the credit evaluator. A maximum of 20 quarter units may represent courses which do not parallel specific courses at Stanford, again, subject to the approval of the credit evaluator as to quality and suitability.

6. The credit allowed at Stanford for one quarter's work may not exceed the number of units that would have been permissible for one quarter if the work had been done at Stanford; for work done under a system other than the quarter system, the permissible maximum units are calculated at an appropriate ratio of equivalence.

7. Credit is allowed at Stanford for work graded 'A', 'B', 'C', or 'Pass', but not for work graded 'D' or below.

8. No more than 90 quarter units of credit for work done elsewhere may be counted toward a bachelor's degree at Stanford.

9. Credit earned in extension and correspondence courses is transferable only if the university offering the courses allows that credit toward its own bachelor's degree. Such credit is limited to a maximum of 45 quarter units for extension courses, a maximum of 15 quarter
units for correspondence study, and a maximum of 45 quarter units for the combination of extension and correspondence courses.

10. Credit earned in military training and service is not transferable to Stanford, unless offered by an accredited college or university in the U.S. and is evaluated as above by the credit evaluator.

CONCURRENT ENROLLMENT

Students may enroll concurrently at Stanford and at another college or university. The following policies apply to Concurrent Enrollment:

1. Students may not exceed 20 units between both schools. This is the same unit maximum for undergraduate students at Stanford.
2. Satisfactory academic progress is determined only by Stanford courses and units. Transfer work completed at other institutions is not considered in this calculation.
3. Students are expected to consult with the Transfer Credit Evaluator (Old Union, room 141) if planning to transfer the work back to Stanford. Consultations should be completed prior to enrolling in the transfer institution.

THE MAJOR

The primary purpose of the major is to encourage each student to explore a subject area in considerable depth. This in-depth study complements the breadth of study promoted by the General Education Requirements and, in many cases, by a student's choice of electives. Work in depth permits practice in critical analysis and the solving of problems. Because of its depth, such study also provides a sense of how knowledge grows and is shaped by time and circumstances.

The structure of a major should be a coherent reflection of the logic of the discipline it represents. Ideally, the student should be introduced to the subject area through a course providing a general overview, and upper-division courses should build upon lower-division courses. The course of study should, if feasible, give the student the opportunity and responsibility of doing original, creative work in the major subject. Benefits of the major program are greatest when it includes a culminating and synthesizing experience such as a senior seminar, an undergraduate thesis, or a senior project.

REQUIREMENTS

Undergraduates must select a major by the time they achieve junior status (85 units completed). All undergraduate major programs listed in this bulletin, except for certain honors degree programs that require application and admission in advance, are open to all students. Students may use Axess to declare, drop or exchange a major at any time. In some departments or programs, though, a late change could easily result in extending the period of undergraduate study. Students who have applied to graduate, wish to declare an individually-designed major or pursue a dual A.B./B.S. degree, and coterm students must use printed forms to select or change a major. Students requiring assistance should contact the Registrar’s Degree Progress Office, Old Union, room 132.

Check individual department or program listings in this bulletin for the undergraduate degrees offered and for specific major requirements. If an area of study has no baccalaureate degree, that discipline is not available as a regular undergraduate major.

Faculty set the minimum requirements for the major in each department. These requirements usually allow latitude for tailoring a major program to a student's specific educational goals. The responsibility for developing a major program within department or program requirements lies ultimately with the individual student working in consultation with the major adviser.

MULTIPLE MAJORS

Although most students declare only one major, a student may formally declare more than one major within a single bachelor's degree (A.B., B.S., or B.A.S.) program. The student may do that either at the time of initial major declaration or, as may be more advisable given the plan-ning required to complete more than one major, by amending the original declaration. The student’s major departments or programs will have access routinely to all information pertinent to that student's academic record (for example, course and grade information), and each is expected to provide advising and other assistance. Students may pick up appropriate information regarding major declarations from the Registrar's Office. To be awarded a bachelor’s degree with multiple majors, the student must fulfill the following requirements:

1. Formally declare all majors to the Registrar's Office.
2. Satisfy the requirements of each major without applying any course towards the requirements of more than one major or any minor unless a) overlapping courses constitute introductory skill requirements (for example, introductory math or a foreign language) b) overlapping courses enable the student to meet school requirements (for example, for two majors within the School of Engineering). Currently, only the School of Engineering has school requirements for its undergraduate majors.

Students pursuing multiple majors must complete a multiple major program sheet indicating which courses they plan to apply toward each major and any minor(s). Departments must certify that the plan of study meets all requirements for the majors and any minor(s) without unallowable overlaps in course work. To facilitate advance planning, multiple major program sheets are available at any time in the Degree Progress Office, room 132, Old Union.

When students cannot meet the requirements of multiple majors without overlaps, the secondary major, outlined below, may be relevant.

SECONDARY MAJOR

In some cases, students may complete course requirements for more than one major, but they may not meet the requirements outlined for the multiple major option. For example, the student may develop a course plan in which courses requisite for one major overlap with requirements for another. In these cases, the student may declare a secondary major which will result in the transcript bearing an annotation that the course requirements for that major have also been met.

LIMITS OF THE MAJOR

In order to achieve the values of study in depth, a well-structured major should constitute approximately one-third of a student’s program (55-65 units). To ensure the values of breadth, a major should comprise no more than two-thirds of a student’s program (115-125 units). And, to avoid intellectual parochialism, a major program should not require a student to take more than about one-third of his or her courses from within a single department.

Major requirements in cognate subjects essential to the structure of a given major should be counted as part of the major program in applying these guidelines. Department or school requirements designed to provide extra disciplinary breadth should not be counted.

For a limited number of qualified students, many departments and programs offer special programs leading to degrees with honors. A student may apply to the major department or program for acceptance into the honors program. Demands on the student may vary, but all honors programs encourage creative, independent work at an advanced level in addition to the major requirements.

The guidelines set forth here are deliberately general; implementation must take into account the specific needs of a student’s program and the nature of the discipline or disciplines involved. The exercise of responsibility in achieving the desired educational balance belongs first with the student, who, after all, has the strongest interest in the value of his or her education. It belongs secondarily to departments and major programs, which must set the requirements of competence in the many majors offered.
## UNDERGRADUATE MAJOR UNIT REQUIREMENTS

MINORS, HONORS, ACADEMIC STANDING, AND ADVISING

THE UNDERGRADUATE MINOR

Students completing a bachelor’s degree may elect to complete one or more minors in addition to the major. Minors must be officially declared by students no later than the deadline for their applications to graduate, according to declaration procedures developed and monitored by the Registrar. Earlier deadlines for declaration of the minor may be set by the offering school or department. Satisfactory completion of declared minors is noted on the students’ transcripts after degree conferral.

A minor is a coherent program of study defined by the department or degree program. It may be a limited version of a major concentration or a specialized subset of a field. A minor consists of no fewer than six courses of 3 or more units to a maximum of 36 units of letter-graded work, except where letter grades are not offered. Departments and degree programs establish the structure and requirements of each minor in accordance with the policy above and within specific guidelines developed by the deans of schools. Programs which do not offer undergraduate degrees may also make proposals to their cognizant deans to establish a minor. Requirements for each minor are described in the individual department or program listings in this bulletin.

Students may not overlap (“double-count”) courses for completing major and minor requirements, unless:

1. Overlapping courses constitute introductory skill requirements (for example, introductory math or a foreign language), or

2. Overlapping courses enable the student to meet school requirements (for example, for a major within the School of Engineering and a minor). Currently, only the School of Engineering has school requirements for its undergraduate majors.

Undergraduate students use Axess to declare or drop a minor. Students with questions about declaring minors or double-counting courses towards combinations of majors and/or minors should consult with the departments or programs involved or the Registrar’s Degree Progress Office, room 132, Old Union.

BACCALAUREATE HONORS

With Distinction—In recognition of high scholastic attainment, the University, upon recommendation of a major department or program, awards the Bachelor’s Degree with Distinction to approximately 15 percent of the graduating class. Students are also urged to consider the departmental honors programs that may give depth to their major study and to consider, as well, how the interdisciplinary honors programs might contribute to the quality of their undergraduate education.

Departmental Honors Programs—In recognition of successful completion of special advanced work, departments in more than 30 fields of study may recommend their students for honors. Departmental honors programs demand independent creative work at an advanced level in addition to the major requirements.

Interdisciplinary Honors Programs—In recognition of successful completion of honors program requirements, the following interdisciplinary programs can recommend students majoring in any field for honors in their program:

Education
Environmental Science, Technology, and Policy
Ethics in Society
Feminist Studies
Humanities
Jewish Studies
Latin American Studies (a new honors program is being considered)
Science, Technology, and Society

The interdisciplinary honors programs are designed to complement study in a department major. The requirements for these honors programs are described in the department sections of this bulletin.

Foreign Language Proficiency—The notation “proficiency in (language)” appears on the official transcripts of those students whose levels of achievement are found by procedures established by the language department to be roughly equivalent to knowledge an excellent student can be expected to demonstrate late in the third quarter of the third year of study in that language.

ACADEMIC STANDING

Undergraduates matriculating in Autumn Quarter 1999, and thereafter, are required to adhere to the academic standards described below. The standards include maintaining a minimum 2.0 cumulative GPA and a quantitative unit requirement for good academic standing. In addition, a minimum 2.0 cumulative GPA is required for a baccalaureate degree.

Undergraduates matriculating prior to Autumn 1999 are required to adhere to the academic standards described below but are exempt from the minimum 2.0 cumulative GPA requirement for academic standing purposes. However, departments can elect to require a minimum GPA for course work applicable to the major and the minor. Refer to departmental literature for specific requirements.

Undergraduate students normally are expected to plan their academic programs so that they can complete 180 units in four years (twelve
In addition, students are expected to maintain an overall grade point average of at least 2.0. Transfer work completed at other institutions is not considered in this calculation. A student earning fewer than 9 units per quarter or fewer than 36 units in three quarters, or earning less than a 2.0 cumulative grade point average, is placed on probation. Students on probation or provisional registration status (see definitions below) are required to earn a minimum of 12 units per quarter, by the end of the final quarter examination period for three consecutive quarters, and maintain a cumulative grade point average of at least 2.0 to attain good academic standing. A Stanford Summer Session Quarter counts toward the three consecutive quarter requirement if 11 or more units are completed. The faculty Subcommittee on Academic Standing may stipulate otherwise by acting upon a petition for fewer units.

Full-time enrollment is considered to be enrollment in a minimum of 12 units of course work per quarter at Stanford. Under extenuating circumstances, students may petition to the faculty Subcommittee on Academic Standing to take fewer units. Work necessary to complete units from previous quarters does not count toward the 12 units necessary for full-time enrollment in the current quarter. All students registering for fewer than 12 units should consider the effects of that registration on their degree progress, visas, deferments of student loans, residency requirements, and their eligibility for financial aid and awards.

All undergraduate students validly registered at Stanford are considered to be in good standing for the purposes of enrollment certification and athletic participation.

Units are granted for courses completed with grades 'A,' 'B,' 'C,' 'D,' 'Satisfactory' ('CR' or 'S'), and 'L.' Courses graded 'N' are counted provisionally as units completed, provided the student enrolls in the continuing segment of that course the following quarter. When the course is completed, the student receives the units for which he or she enrolled. No units are granted for a course in which the student receives an 'F' or an 'I' until the course is completed satisfactorily and the final grade reported. (See "Grading Systems" below.)

PROBATION

A student who fails to complete at least 36 units of work in his or her most recent three quarters of enrollment at the University, or who fails to complete by the end of the final examination period at least 9 quarter units of work in his or her most recent quarter of enrollment at the University, or who has a cumulative grade point average of less than 2.0, shall be placed on probation (warning status).

A student shall be removed from probation after three subsequent quarters of enrollment at the University if, in each quarter, he or she completes a minimum of 12 units of new course work by the end of the final examination period and maintains a cumulative grade point average of at least 2.0. A student may also be removed from probation at the discretion of the subcommittee as a result of a review of individual records.

PROVISIONAL REGISTRATION

A student who, while on probation, fails in any quarter of registration to complete a minimum of 12 units of new course work by the end of the final examination period or fails to achieve a cumulative grade point average of at least 2.0, shall be placed on provisional registration status. Provisional registration requires that a student submit a properly endorsed request to return to Stanford.

A student shall be removed from provisional registration after three subsequent quarters of enrollment at the University if, in each quarter, he or she completes a minimum of 12 units of new course work by the end of the final examination period and maintains a cumulative grade point average of at least 2.0. A student may also be removed from provisional registration at the discretion of the subcommittee as a result of a review of individual records.

SUSPENSION

A student who fails to complete a minimum of 12 units of new course work by the end of the final examination period in any quarter of provisional registration, or who fails to maintain a cumulative grade point average of at least 2.0 while on provisional registration, shall be suspended. In addition, and on occasion, a student may also be suspended directly from probation.

In general, students suspended for the first time are suspended for one year. Students suspended a subsequent time are suspended for three years.

Students suspended for one year are not eligible to enroll for four quarters (including Summer Quarter) following the quarter in which the suspension was issued. Students suspended for three years are not eligible to enroll for twelve quarters (including Summer Quarter) following the quarter in which the suspension was issued. Students are required to submit a properly endorsed petition for provisional registration to request reenrollment after the suspension period has been completed.

Return from Suspension—Students who have been suspended are required to petition for provisional registration to return after their suspension has been completed. Students are strongly encouraged to submit their petition for provisional registration at least three months prior to the desired quarter of return, but no later than the first week of the desired quarter of return.

Appeal of Suspension—Students who have been suspended, and who believe they have a compelling reason to appeal their suspension, with or without a break in enrollment, are required to submit a petition for provisional registration. See "Petition Deadlines" for deadline dates to submit petitions for provisional registration to appeal a suspension.

Early Return from Suspension—Students who have been suspended and who believe they have a compelling reason to return early from their suspension are required to submit a petition for provisional registration. See "Petition Deadlines" for deadline dates to submit petitions for provisional registration to return early from suspension.

PETITIONING

Specific instructions for requesting provisional registration or an early return from suspension should be obtained from the Registrar's Academic Standing Office, Old Union, room 141. The faculty Subcommittee on Academic Standing, or those designated by the subcommittee, shall act upon all requests concerning academic standing, including requests for provisional registration. Questions concerning academic standing or the petitioning process should be directed to the Academic Standing Office.

Late petitions to return from suspension, appeal a suspension, or return early from suspension will not be considered. Students are strongly encouraged to submit petitions as early as possible.

Students applying for financial aid and/or on-campus housing should be aware of the deadlines and procedures for those offices.

NOTIFICATION

Written notification that a student is on probation, provisional registration, or suspension is sent to the student and to the student's academic adviser as soon as possible after the close of the quarter. Students also receive written notification of the outcome of their provisional registration petition.
UNDERGRADUATE ACADEMIC ADVISING

The Undergraduate Advising Center (UAC) partners with faculty and staff to address students’ intellectual and developmental goals. The staff coordinates a comprehensive array of programs and advising services designed to support and enhance the undergraduate curriculum. For example, the UAC coordinates the Freshman Advising, Resources, and Mentoring (FARM) program through which freshmen make connections with students, faculty, and staff who share their interests. The Partners for Academic Excellence (PAE) program is another example of a mentoring program designed to increase participants’ connection to and involvement in the academic and social networks of the campus.

Freshmen are assigned to general academic advisers according to their residence and their preliminary academic interest. Freshman advisers work with advisees each quarter to plan their academic programs; advisers must provide an approval code for the on-line filing of study lists through Axess for each quarter of the students’ freshman year.

Sophomores who are undecided about their majors continue to work with the advisers they had as freshmen, and to seek out their advisers’ guidance and approval code. By the time they achieve junior status, undergraduates must declare a major, at which time they are assigned to an adviser from the faculty of the major department or program.

The UAC’s staff of professional advisers, located on the first floor of Sweet Hall, provides advising to all students, freshmen through seniors. The UAC staff offers students help when the official adviser is unavailable or when additional advice is needed; assistance with curriculum planning, including four-year plans; help with choosing a major; information on designing an individually designed major; academic and personal counseling related to academic performance; advice regarding plans to attend graduate or preprofessional school; peer tutoring; and learning skills classes, counseling, and workshops. Reference guides to graduate and professional schools are available. For detailed information, see the UAC web site at http://uac-server.stanford.edu/ or request a copy of the UAC brochure.
Graduate Degrees

GENERAL REQUIREMENTS

For each Stanford advanced degree, there is an approved course of study which meets University and department requirements. The University's general requirements, applicable to all graduate degrees at Stanford, are described below. University requirements pertaining to only a subset of advanced degrees are described in the "Degree-Specific Requirements" section.

See the "Graduate Programs" section of each department's listing for specific department degree requirements. Information on professional school programs is available in the bulletins of the Graduate School of Business, the School of Law, and the School of Medicine.

REGISTRATION REQUIREMENTS

Graduate students must register for all terms of each academic year (Autumn, Winter, and Spring quarters or, for Law students, Autumn and Spring semesters), from the admission term until conferral of the degree. The only exception to this requirement occurs when the student is granted an official leave of absence. Failure to register for a term during the academic year without taking a leave of absence results in denial of further registration until reinstatement to the degree program is granted and the reinstatement fee paid. Registration in Summer Quarter is not required and does not substitute for registration during the academic year.

In addition to the above requirement for continuous registration during the academic year, graduate students are required by the University to be registered:

1. In each term during which any official department or University requirement is fulfilled, including qualifying exams or the University oral exam.
2. In any term in which a University dissertation/thesis is submitted or at the end of which a graduate degree is conferred, unless the student was registered the prior term.
3. Normally, in any term in which the student receives financial support from the University.
4. In any term for which the student needs to use University facilities, such as on-campus housing, libraries, Cowell Health Service, and so on.
5. For international students, in any term of the academic year for which they have non-immigrant status (for example, a J1 or F1 visa).

Individual students may also find themselves subject to the registration requirements of other agencies (for example, external funding sources such as Federal financial aid). Course work and research are expected to be done on campus unless the department gives prior approval for study in absentia and a petition for in absentia registration is approved by the Registrar's Office.

LEAVES OF ABSENCE

Graduate students who do not meet the requirement for continuous registration during the academic year must obtain an approved leave of absence, in advance, for the term(s) they will not be registered. The leave of absence must be reviewed for approval by the chair or director of graduate studies of the student's major department and, if the student is in the United States on a visa, by the Bechtel International Center. The granting of a leave of absence is at the discretion of the department.

New graduate students and approved coterminals may not take a leave of absence during their first quarter. Coterminal students are required to register their first graduate quarter. However, new Stanford students may request a deferment.

Leaves of absence are granted for a maximum of one calendar year. Leaves requested for a longer period are approved only in exceptional circumstances (for example, mandatory military service). An extension of leave (a maximum of one year) for students in master's programs or for doctoral students not yet admitted to candidacy, is approved only in unusual circumstances. Extension requests must be made before the expiration of the original leave of absence. Leaves of absence may not exceed a cumulative total of two years.

Students on leave of absence are not registered at Stanford and, therefore, do not have the rights and privileges of registered students. They cannot fulfill any official department or University requirements during the leave period.

Students on leave may complete course work for which an Incomplete grade was awarded in a prior term and are expected to comply with the usual one-year time limit for resolving incompletes.

REINSTATEMENT

Students who fail to be either registered or approved for a leave of absence by the start of a term are required to apply for reinstatement through the Graduate Admissions Office before they can return to the same degree program. The decision to approve or deny reinstatement is made by the student's department or program. Departments are not obliged to approve reinstatements of students. Reinstatement decisions may be based on the applicant's academic status when last enrolled, activities while away from campus, the length of the absence, the perceived potential for successful completion of the program, and the ability of the department to support the student both academically and financially, as well as any other factors or considerations regarded as relevant by the department.

Reinstatement information is available from the Graduate Admissions Office. A fee is required. Reinstatement applications must be submitted by the first day of the term for which reenrollment is requested if the student is registering for courses.

RESIDENCY

At Stanford, as at other research universities, each advanced degree program has a residency requirement of a minimum number of full-tuition quarters of registration or the equivalent in partial-tuition quarters. Where more than one advanced degree is pursued, the residency requirement may be unique to that particular combination of degrees.

The residency requirements for most degrees and degree combinations are listed in the chart below. Residency measures tuition assessments; the number of course units attempted or completed has no bearing on residency. It should also be noted that the residency requirement represents the minimum tuition requirement for a degree; an individual student, depending on his or her program, preparation, and choices, may need to accrue more residency than the requirement states to earn the degree.

The fundamental reason for this requirement is educational: the minimum residency fixed for each program is the shortest period that students generally need to attain the level of expertise that a particular Stanford advanced degree signifies, by completing specified course work and other degree requirements, and by immersing themselves in the intellectual life of the University.

The residency requirement also ensures that a reasonable proportion of the University's expenses for providing the requisites of a high-quality education are met from tuition income, particularly the expense of small classes and the need for state-of-the-art laboratory facilities and comprehensive library collections. These expenses remain constant even if, as sometimes happens, a student satisfies his or her other degree requirements before completing the residency requirement.

In such cases, the student can receive the degree early but must pay tuition for the full residency period. A tuition deficiency (a percent of residency less than the required number of quarters) for a degree may be paid to obtain the degree or to qualify for Terminal Graduate Registration (TGR) status.

Residency is stated in terms of full-tuition quarters. Registration at the full-tuition rate (11 or more units during the academic year and 15 units during Summer Quarter) earns one quarter of residency. Residency for partial tuition quarters during the academic year accrues as follows:

- 3 units = .24
- 4 units = .31
- 5 units = .37
- 6 units = .43
- 7 units = .50
- 8 units = .56
- 9 units = .62
- 10 units = .68

- 11 units = .74
- 12 units = .80
- 13 units = .86
- 14 units = .92
- 15 units = 1.00

...
Residency is most commonly accrued through registration at Stanford as a matriculated graduate student. Within applicable policy, it may also be earned through graduate work done elsewhere (see below), registration as a non-matriculated student at Stanford, or payment of a tuition deficiency.

Further information about the residency requirement is available from the Degree Progress Office in the Old Union.

RESEIDENCY AND UNIT REQUIREMENTS IN COTERMINAL PROGRAMS

Unit Requirement—The University minimum requirements for coterminal bachelor's/master's program are 180 units for the bachelor's degree plus 36 (or higher departmental requirement, as determined by each graduate department) unduplicated units for the master's degree. The requirements for the coterminal program with dual undergraduate degrees are 180 units for the first bachelor's degree, 45 units for the second bachelor's degree, 36 to 45 units for the master's degree. Of the 36-unit University minimum for the master's degree, all courses must be at or above the 100 level and 50 percent must be courses designated primarily for graduate students (typically at least at the 200 level). Department requirements may be higher. Units for a given course may not be counted to meet the requirements of more than one degree, that is, no units may be double-counted. No courses taken more than two quarters prior to admission to the coterminal master's program may be used to meet the 36-unit University minimum requirement for the master's degree.

Residency Requirement—All Stanford master's degree students are required to complete a residency requirement.

The residency requirement for a student pursuing an A.B., B.S., or B.A.S., and a coterminal master's degree can be fulfilled by completing three full-tuition quarters (or the equivalent in partial-tuition quarters) after reaching 180 units (90 units completed at Stanford). For example, the student who has 180 units at the end of a Autumn Quarter, will begin to accrue graduate residency during the Winter Quarter. If the student has 179 units at the end of Autumn Quarter, graduate residency will not accrue during the Winter Quarter as the 180 unit minimum had not been reached during Autumn Quarter. Advanced Placement and undergraduate transfer units on the student's transcript assist the student in reaching the 180-unit milestone sooner, but cannot be counted towards the three required quarters thereafter.

The residency requirement for a student pursuing dual degrees (an A.B. and a B.S.) and a coterminal master's degree can be fulfilled by completing three full-tuition quarters (or the equivalent in partial-tuition quarters) after reaching 225 units (135 units completed at Stanford). This higher requirement follows the same rules as described in the above paragraph, except the student will begin to accrue graduate residency the quarter after reaching the 225-units milestone.

A full-tuition quarter is registration at the full-tuition rate (11 or more units during the regular academic year and 15 or more units during the Summer Quarter). A partial tuition quarter is registration below the full-tuition rate. For example, students who register for 9 units during an academic quarter accrue 62 percent (0.62) of one full-tuition quarter (see residency for partial tuition quarters as those described above).

Tuition Rate for Graduate Engineering—The tuition rate for graduate Engineering is higher than for undergraduate programs. Students enrolled in a coterminal program in the School of Engineering need to earn three quarters for graduate residency, as do other master's degree students. They begin to pay the higher graduate Engineering tuition rate in the quarter after they have reached 180 units and after they have been enrolled for twelve quarters as undergraduates, at the 11 or more unit rate during the regular academic year (or the 15 or more unit rate during the summer quarters). In effect, undergraduate students are allotted twelve quarters of undergraduate tuition. For example, a student in a coterminal program in the School of Engineering who earned 180 units by the end of the eleventh quarter of enrollment, would begin to accrue graduate residency during the twelfth quarter, but would only start to pay the graduate Engineering tuition rate during the thirteenth quarter of enrollment.

Coterminal students in the School of Engineering, with two undergraduate degrees, are assessed the graduate Engineering tuition rate in the quarter after they have reached 225 units and after they have been enrolled for fifteen quarters as undergraduates, at the 11 or more unit rate during the regular academic year (or the 15 or more unit rate during the summer quarters).

Engineering coterminal students would also start paying the graduate Engineering tuition rate if any undergraduate degree is conferred or if they are granted any graduate aid. Once charged under the graduate Engineering tuition schedule, the tuition will not revert thereafter to the undergraduate rate.

For additional information on the coterminal bachelor's/master program, see Coterminal Bachelor's and Master's Degrees in the "Undergraduate Degrees" section of this bulletin.

RESIDENCY CREDIT FOR GRADUATE WORK DONE ELSEWHERE

After at least one quarter of enrollment, students pursuing an Engineer, Ed.S., D.M.A., Ed.D., or Ph.D. may apply for residency credit for graduate work done at another institution. Engineer or Ed.S. candidates who also earned their master's at Stanford are not eligible for transfer residency credit, nor are any master's degree students. The chart below shows the maximum number of transfer quarters that will be accepted towards Stanford's residency requirement for each degree or degree combination. Regardless of whether transfer residency credit is approved, transfer courses may be used to fulfill department course requirements at the department's discretion, but cannot be applied to Stanford's minimum unit requirement for the degree.

Students enrolled at Stanford who are going to study elsewhere during their degree program should obtain prior approval of any transfer residency sought before their departure.

The following criteria are used by the department in determining whether, in its discretion, it will award transfer residency credit for graduate-level work done at another institution:

1. Courses should have comparable Stanford counterparts that are approved by the student's department. A maximum of 12 units of courses with no Stanford counterparts and/or research units may be granted transfer residency credit.
2. The student must have been registered in a student category which yields graduate credit. The maximum amount of credit given for extension and non-matriculated (non-degree) courses is one quarter. No transfer credit is given for correspondence work.
3. Courses must have been taken after the conferral of the bachelor's degree. The only exception is for work taken through programs structured like the Stanford coterminal bachelor's/master's program.
4. Courses must have a grade point average (GPA) of 'B' (3.0) or better. Pass grades are accepted only for courses for which letter grades were not an option and for which the standard of passing is 'B' quality work.
5. Courses must have been taken at a nationally accredited institution in the U.S. or at an officially recognized institution in a foreign country. Courses taken at foreign universities must be at the level of study comparable to a U.S. graduate program.

The Application for Residency Credit for Graduate Work Done Elsewhere is reviewed by the department and the Degree Progress Office.

</table>

**Notes**

1. The specific unit requirement for each master’s degree program is determined by the department. The University minimum requirement is 36 unduplicated units; department requirements may be higher.
2. The specific University residency and units requirements for a bachelor’s/master’s program are described above under Residency and Unit Requirements in Coterminal Programs.

**UNIVERSITY MINIMUM UNITS REQUIREMENT**

Each Stanford graduate degree or combination of degrees is subject to a requirement specifying the minimum number of units that must be earned at Stanford. The minimum units requirement for most degrees and degree combinations is listed in the chart above.

The minimum units requirement measures the units completed by the student, without regard for whether the units were earned in courses required for the degree and/or courses that are not part of the department’s course requirements. Study at another institution never counts towards the minimum units requirement, unless the courses were taken through Stanford’s Exchange Scholar Program or formal exchange program with U.C. Berkeley or U.C. San Francisco.

When multiple degrees are being pursued, units must be “unduplicated.” This means that units counted towards one degree may not be counted again towards another.

For all graduate degrees, the University’s expectation is that the units counted towards the minimum unit requirement are primarily in graduate courses. The University has set specific requirements for units applied...
to the minimum unit requirement for the A.M., M.S., M.A.T, and M.F.A. degrees: all units must be in courses at or above the 100 level and at least 50 percent of those must be courses designated primarily for graduate students (typically at least the 200 level). Units earned in courses below the 100 level may not be counted towards the minimum unit requirement for the master’s degree. Department specifications for the level of course work accepted for a particular master’s degree program may be higher than the University’s specifications.

SATISFACTORY PROGRESS REQUIREMENTS
The academic requirements for graduate students include timely completion of degree and program requirements, such as admission to candidacy, successful completion of qualifying exams, and so on. The standards for students in professional degree programs are described in the bulletins for the schools of Business, Law, and Medicine. Students in other degree programs must also meet the following standards of satisfactory progress as indicated by registration and reporting of grades.

Graduate students registered at full tuition must enroll for at least 11 units and must pass, over the course of three quarters, a total of 24 units, and at least 8 units per term. Those registered at the 9-unit rate must pass, over the course of three quarters, a total of 18 units, and at least 6 units per term. Students with permission to register for 8 units or fewer must complete a proportionate number of units, unless other requirements are specified.

Department requirements for satisfactory progress that set higher standards (as to units to be completed or grades to be maintained) take precedence over the University policy.

Students identified as not meeting the requirements for satisfactory progress are reviewed by their departments to determine whether the problem lies with administrative matters such as reporting of grades or with academic performance. Students have the opportunity to explain any special circumstances. Approval for continuation in the degree program is contingent on agreement by the student and department to a suitable plan to maintain satisfactory progress in subsequent quarters. Dismissal of graduate students is addressed below.

Graduate students who have been granted Terminal Graduate Registration (TGR) status must enroll each term in the TGR course (801 for master’s and Engineer programs or 802 for doctoral programs) in their department in the section appropriate for the adviser. An ‘N’ grade signifying satisfactory progress must be received each quarter to maintain registration privileges. An ‘N’ - grade indicates unsatisfactory progress. The first ‘N’ - grade constitutes a warning. A second consecutive ‘N’ - grade will cause the student to be denied further registration until a written plan for completion of degree requirements has been approved by the department. Subsequent ‘N’ - grades are grounds for dismissal from the program.

GUIDELINES FOR DISMISSAL OF GRADUATE STUDENTS FOR ACADEMIC REASONS
Admission to graduate programs at Stanford is highly selective. It is anticipated that every admitted student will be able to fulfill the requirements for the advanced degree. This policy provides guidelines for the unusual circumstance that a department must consider dismissal of a graduate student for academic reasons. These guidelines apply to all advanced degree programs except those in the schools of Law or Business or the M.D. program in the School of Medicine. Business, Law, and M.D. programs follow guidelines issued by the respective school.

The principal conditions for continued registration are a timely completion of the University, department, and program requirements for that program, and satisfactory progress (as discussed in the preceding section). The guidelines that follow specify procedures for dismissal of graduate students who are not meeting these conditions. In such cases, the department (through the chair, the Director of Graduate Studies, or the student’s faculty adviser) will:

1. Where possible and as early as possible, warn students, in writing, of the situation and deficiency. A detailed explanation of the reason for the warning should be provided.
2. Consider extenuating circumstances.

3. Place a summary of department discussions, votes, and decisions about this matter in the students’ files.
4. Provide students the opportunity to examine their department files, if requested.
5. Provide students with information on their rights to appeal under the statement on Student Academic Grievance Procedures. (This is included in this bulletin.)

Careful records of department decisions safeguard the rights of both students and faculty.

ADDITIONAL SPECIFICS FOR DEGREES WITH CANDIDACY

Before Candidacy—A department committee may vote to dismiss a student who is clearly not making satisfactory progress before review for admission to candidacy. Before considering dismissal, the committee should communicate with the student (which may include a meeting with the student) concerning his or her academic performance and how to correct deficiencies.

In a review for admission to candidacy, if the department votes not to recommend the student for admission to candidacy, the vote will result in the dismissal of the student from the program. The Director of Graduate Studies or the student’s adviser shall communicate the department’s decision to the student in writing and orally. The student may submit a written request for reconsideration. The committee shall respond in writing to the request for reconsideration; it may refuse to reconsider its decision.

During Candidacy—When a student admitted to candidacy is not making satisfactory progress or not completing University, department, or program requirements, the student’s adviser, the Director of Graduate Studies, and other relevant faculty should meet with the student. A written summary of these discussions shall be sent to the student and the adviser and added to the student’s department file. The summary should specify the student’s academic deficiencies, the steps necessary to correct them, and the period of time that is allowed for their correction (normally a minimum of one academic quarter). At the end of the warning period, the department’s Graduate Studies Committee should review the student’s progress and notify the student of its proposed actions. If the student has made satisfactory progress, he or she should be notified in writing that the warning has been lifted.

If, at the end of the warning period, the student has not in the view of the Graduate Studies Committee corrected the deficiencies, the committee may initiate proceedings for dismissal. The student shall be notified, in writing, that the case of dismissal will be considered at an impending department committee meeting. The student has the right to be invited to attend a portion of the scheduled meeting to present his or her own case; a student may also make this case to the committee in writing.

After full discussion at the department committee meeting, the committee, without the student present, reviews the case and votes on the issue of dismissal. A minimum of three faculty members must be present, and a decision is by majority vote. The student is sent a written summary of the discussion, including the committee’s decision and the reasons for it. The student may submit a written request for reconsideration. The department committee may refuse to reconsider its decision. The committee’s response to the request for reconsideration shall be made in writing.

CONFERRAL OF DEGREES

Upon recommendation to the Senate of the Academic Council by the faculty of the relevant departments or schools and the Committee on Graduate Studies, degrees are awarded four times each year, at the conclusion of Autumn, Winter, Spring, and Summer terms. All diplomas, however, are prepared and awarded in Spring Quarter. Stanford University awards no honorary degrees.

Students must apply for conferral of a graduate degree by filing an Application to Graduate before the deadline of each term. The application should be filed preferably in the second week, but no later than the last day of classes of the conferral quarter, as listed on the University calendar. A separate application must be filed for each degree program and for each conferral term. Applications are filed through Axess, the on-
Requests for conferral are reviewed by the Degree Progress Office, and the student's department, to verify completion of degree requirements. Registration is required in the conferral term or the term immediately preceding. Students with unmet financial obligations resulting in the placement of a hold on their registration will not receive a transcript, statement of completion, degree certificate, or diploma until the hold is released by the Bursar’s Office.

Students who wish to withdraw a request for conferral or make changes to the Application to Graduate should notify the Degree Progress Office in writing. Students who withdraw their graduation applications or fail to meet degree requirements must reapply to graduate for a subsequent term.

CHANGES OF DEGREE PROGRAMS

Graduate students are admitted to Stanford for a specific degree program. Students who have attended Stanford for at least one term and who are currently enrolled or on an approved leave of absence may submit a Graduate Program Authorization Petition to make one of the following changes: (1) change to a new degree program in the same department; (2) change to a new degree program in a different department; (3) add a new degree program in the same or a different department to be pursued with the existing program. Coterminous students must have the bachelor’s degree conferred before adding a second advanced degree program.

It is important that the attempt to add or change degree programs be made while enrolled. Otherwise, a new Application for Graduate Admission must be submitted and an application fee paid. The Graduate Program Authorization Petition is submitted directly to the department in which admission is requested. If applying for a higher degree program, students may also be required to submit other application materials such as GRE Subject Test scores, a statement of purpose, or new letters of recommendation.

International students changing departments or degree programs must also obtain the approval of the Foreign Student Adviser at the Bechtel International Center. If the requested change lengthens their stay, they also are required to submit verification of sufficient funding to complete the new degree program.

Students who wish to terminate study in a graduate program should submit to the department a letter indicating the program from which they wish to withdraw and the effective date. To return to graduate study thereafter, the student is required to apply for reinstatement (if returning to the same degree program) or admission (if applying to a different program). Both applications require payment of a fee.

DEGREE-SPECIFIC REQUIREMENTS

MASTER OF ARTS AND MASTER OF SCIENCE

In addition to completing the general requirements for advanced degrees and the requirements specified by their department, candidates for a Master of Arts (A.M.) or Master of Science (M.S.) degree must complete their degree requirements within the time limit specified below and must outline an acceptable program of study on the Master's Degree Program Proposal.

MASTER'S PROGRAM PROPOSAL

Students pursuing an A.M., M.F.A., M.A.T., or M.S. are required to submit an acceptable program proposal to their department during the first quarter of enrollment. Coterminous students must submit the proposal during the first quarter after their completion of 180 units. The program proposal establishes a student's individual program of study to meet University and department degree requirements. Students must amend the proposal formally if their plans for meeting degree requirements change.

In reviewing the program proposal or any subsequent amendment to it, the department confirms that the course of study proposed by the student fulfills all department course requirements (for example, requirements specifying total number of units, course levels, particular courses, sequences, or substitutes). The department confirms that all other department requirements (for example, required projects, foreign language proficiency, or qualifying exams) are listed on the form and that all general University requirements (minimum units, residency, and so on) for the master's degree will be met through the proposed program of study.

TIME LIMIT FOR COMPLETION OF THE MASTER’S DEGREE

All requirements for a master’s degree must be completed within three years after the student’s first term of enrollment in the master’s program. Students pursuing a coterminous master’s degree must complete their requirements within three years of their first quarter of graduate standing.

The time limit is not automatically extended by a student’s leave of absence. All requests for extension, whether prompted by a leave or some other circumstance, must be filed by the student before the conclusion of the program’s time limit. Departments are not obliged to grant an extension. The maximum extension granted is one additional year. Extensions require review of academic progress and any other factors regarded as relevant by the department, and approval by the department.

MASTER OF BUSINESS ADMINISTRATION

The degree of Master of Business Administration (M.B.A.) is conferred on candidates who have satisfied the requirements established by the faculty of the Graduate School of Business and the general requirements for advanced degrees. Full particulars concerning the school requirements are found in the Graduate School of Business bulletin. The M.B.A. must be completed within the time limit for completion of the master’s degree.

MASTER OF ARTS IN TEACHING

The program leading to the Master of Arts in Teaching (M.A.T.) is designed for experienced teachers or for individuals who have previously completed programs of teacher preparation. In addition to completing the general requirements for advanced degrees and the program requirements specified by the School of Education, candidates for the degree of Master of Arts in Teaching (M.A.T.) candidates must fulfill the requirements for a master’s program proposal as specified above and complete their degrees within the time limit for completion of the master’s degree.

MASTER OF FINE ARTS

In addition to completing the general requirements for advanced degrees and the program requirements specified in the "Art and Art History" section of this bulletin, candidates for the degree of Master of Fine Arts (M.F.A.) must fulfill the requirements for a master’s program proposal and complete their degrees within the time limit for completion of the master’s degree, as specified above.

ENGINEER

In addition to completing the general requirements for advanced degrees and the requirements specified by their department, candidates for the degree of Engineer must be admitted to candidacy and must complete a thesis per the specifications below.

CANDIDACY

The Application for Candidacy for Degree of Engineer is an agreement between the student and the department on a specific program of study to fulfill degree requirements. Students must apply for candidacy by the end of the second quarter of the program. Honors Cooperative students must apply by the end of the fourth quarter of the program. Candidacy is valid for five calendar years.
THESIS

A University thesis is required for the Engineer degree. Standards for professional presentation of the thesis have been established by the Committee on Graduate Studies and are detailed in Directions for Preparing Theses for Engineer Degrees, available from the Degree Progress Office in the Old Union.

The deadline for submission of theses for degree conferral in each term is specified by the University calendar. Three copies of the thesis, bearing the approval of the adviser under whose supervision it was prepared, must be submitted to the Degree Progress Office before the quarterly deadline listed on the University calendar. A fee is charged for binding copies of the thesis.

Registration is required for the term, or the immediately preceding term, in which the thesis is submitted. The period between the last day of final exams of one term and the first day of the subsequent term is considered an extension of the earlier term. Students submitting a thesis during this period would meet the registration requirement but would be eligible for degree conferral only in the subsequent term.

EDUCATIONAL SPECIALIST

In addition to completing the general requirements for advanced degrees and the program requirements specified in the "Education" section of this bulletin, candidates for the degree of Educational Specialist (Ed.S.) must complete a field-based project.

MASTER OF LEGAL STUDIES

Admission to study for the Master of Legal Studies degree (M.L.S.), a nonprofessional degree, is granted to students who hold the Doctor of Philosophy (Ph.D.) or other nonlaw doctoral degree, or who have been admitted to a nonlaw doctoral program and have completed a program of study amounting to 45 quarter units or 30 term units of work toward the doctorate, and who meet an admission standard equivalent to that required of candidates for the Doctor of Jurisprudence degree.

The M.L.S. degree is conferred upon candidates who, in not fewer than two academic terms in residence and in not more than two consecutive academic years, successfully complete 30 term units of work in the School of Law, including three first-year courses in the first autumn term and at least one course or seminar requiring a research paper. All work shall conform to the rules and regulations of the University and the School of Law.

DOCTOR OF JURISPRUDENCE

The degree of Doctor of Jurisprudence (J.D.) is conferred on candidates who satisfactorily complete courses in law totaling the number of units required under the current Faculty Regulations of the School of Law over not less than three academic years and who otherwise have satisfied the requirements of the University and the School of Law.

DOCTOR OF MUSICAL ARTS

The degree of Doctor of Musical Arts (D.M.A.) is conferred on candidates who have satisfied the general requirements for advanced degrees, the program requirements specified in the "Music" section of this bulletin, and the candidacy requirement as described below in the "Doctor of Philosophy" section.

DOCTOR OF EDUCATION

In addition to completing the general requirements for advanced degrees and the requirements specified by the School of Education, candidates for the Doctor of Education (Ed.D.) degree must fulfill the following requirements as detailed in the "Doctor of Philosophy" section below: candidacy, University oral examination, and dissertation.

MASTER OF THE SCIENCE OF LAW

The degree of Master of the Science of Law (J.S.M.) is conferred upon candidates who have completed one academic year (26 term-units) with distinction in accordance with the rules of the University and the School of Law.

The degree is primarily designed for those qualified students who hold a J.D. or its equivalent and who are at the Stanford School of Law for independent reasons (for example, as teaching fellows) and who wish to combine work toward the degree with their primary academic activities. Specially qualified lawyers, public officials, academics, and other professionals who have worked outside the United States may apply for the degree through the Stanford Program in International Legal Studies (SPILS). Full particulars concerning requirements may be found in the Stanford University bulletin School of Law.

DOCTOR OF THE SCIENCE OF LAW

The degree of the Doctor of the Science of Law (J.S.D.) is conferred upon candidates who hold a J.D. or its equivalent, who complete one academic year in residence, and who, as a result of independent legal research, present a dissertation that is, in the opinion of the faculty of the School of Law, a contribution to knowledge. Such work and dissertation shall conform to the rules of the School of Law and the University, as described below in the "Doctor of Philosophy" section.

Candidacy is limited to students of exceptional distinction and promise. Full particulars concerning requirements may be found in the Stanford University bulletin School of Law.

DOCTOR OF MEDICINE

Candidates for the degree of Doctor of Medicine (M.D.) must satisfactorily complete the required curriculum in medicine. All requirements for the M.D. degree are detailed in the Stanford University School of Medicine Catalog.

DOCTOR OF PHILOSOPHY

The degree of Doctor of Philosophy (Ph.D.) is conferred on candidates who have demonstrated substantial scholarship, high attainment in a particular field of knowledge, and ability to do independent investigation and present the results of such research. They must satisfy the general requirements for advanced degrees, the program requirements specified by their departments, and the doctoral requirements described below. The option for a Ph.D. minor is also described below, though it is not a Ph.D. requirement.

CANDIDACY

Admission to a doctoral degree program is preliminary to, and distinct from, admission to candidacy. Admission to candidacy for the doctoral degree is a judgment by the faculty of the student's potential to complete successfully the requirements of the degree program. Students are expected to complete department qualifying procedures and apply for candidacy by the end of their second year in the Ph.D. program. Honors Cooperative students must apply by the end of their fourth year.

The Application for Candidacy specifies a departmentally approved program of study to fulfill degree requirements, including required course work, language requirements, teaching requirements, dissertation (final project public lecture-demonstration for D.M.A.), and University oral examination (for Ph.D. and Ed.D.). At least 3 units of work must be taken with each of four Stanford faculty members.

If the Ph.D. student is pursuing a minor, approval by the department awarding the minor is also required on the Application for Candidacy.

TIME LIMIT FOR COMPLETION OF A DEGREE WITH CANDIDACY

All requirements for the degree must be completed before candidacy expires. Candidacy is valid for five years unless terminated by the department (for example, for unsatisfactory progress). The time limit is not automatically extended by a student's leave of absence. All requests for extension, whether prompted by a leave or some other circumstance, must be filed by the student before the conclusion of the program's time limit. Departments are not obliged to grant an extension. The maximum extension granted is one additional year. Extensions require review by the department of a dissertation progress report, a timetable for completion of the dissertation, any other factors regarded as relevant by the department, and approval by the department.
TEACHING AND RESEARCH REQUIREMENTS

A number of departments require their students to teach (serving as a teaching assistant) or assist a faculty member in research (serving as a research assistant) for one or more quarters as part of their doctoral programs. Detailed information is included in the department sections of this bulletin.

FOREIGN LANGUAGE REQUIREMENT

Some departments require a reading knowledge of one or more foreign languages as indicated in department sections of this bulletin. Fulfillment of language requirements must be endorsed by the chair of the major department on the Foreign Language Report form.

UNIVERSITY ORAL EXAMINATION

Passing a University oral examination is a requirement of the Ph.D. and Ed.D. degrees. The purpose of the examination is to test the candidate’s command of the field of study and to confirm fitness for scholarly pursuits. Departments determine when, after admission to candidacy, the oral examination is taken and whether the exam will be a test of knowledge of the field, a review of a dissertation proposal, or a defense of the dissertation.

Students must be registered in the term in which the University oral examination is taken. The period between the last day of final exams of one term and the first day of the following term is considered an extension of the earlier term. Candidacy must also be valid.

The University Oral Examination Committee consists of at least five Stanford faculty members: four examiners and the committee chair from another department. All members are normally on the Stanford Academic Council, and the chair must be a member. Emeritus faculty are also eligible to serve as examiners or chair of the committee. (A petition for appointment of an examining committee member who is not on the Academic Council may be approved if that person contributes an area of expertise that is not readily available from the faculty.) The chair of the examining committee may not have a full or joint appointment in the adviser’s or student’s department, but may have a courtesy appointment in the department. The chair can be from the same department as any other member(s) of the examination committee and can be from the student’s minor department provided that the student’s adviser does not have a full or joint appointment in the minor department.

The University Oral Examination form must be submitted to the department graduate studies administrator at least two weeks prior to the proposed examination date. The examination is conducted according to the major department’s adopted practice, but it should not exceed three hours in length, and it must include a period of private questioning by the examining committee.

Responsibility for monitoring appointment of the oral examination chair rests with the candidate’s major department. Although the department cannot require the candidate to approach faculty members to serve as chair, many departments invite students and their advisers to participate in the process of selecting and contacting potential chairs.

The candidate passes the examination if the examining committee casts four favorable votes out of five or six, five favorable votes out of seven, or six favorable votes out of eight. Five members present and voting constitute a quorum. If the committee votes to fail a student, the committee chair sends within five days a written evaluation of the candidate’s performance to the major department and the student. Within 30 days and after review of the examining committee’s evaluation and recommendation, the chair of the student’s major department must send the student a written statement indicating the final action of the department.

DISSERTATION

An approved doctoral dissertation is required for the Ph.D., Ed.D., and J.S.D. degrees. The doctoral dissertation must be an original contribution to scholarship or scientific knowledge and must exemplify the highest standards of the discipline. If it meets this standard, the dissertation is approved for the school or department by the doctoral dissertation reading committee. Each member of the reading committee signs the signature page of the dissertation to certify that the work is of acceptable scope and quality. One reading committee member reads the dissertation in its final form and certifies on the Certificate of Final Reading that department and University specifications have been met.

Dissertations must be in English. Approval for writing the dissertation in another language is normally granted only in cases where the other language or literature in that language is also the subject of the discipline. Such approval is routinely granted for dissertations in the Division of Literatures, Cultures, and Languages, in accordance with the policy of the individual department. Dissertations written in another language must include an extended summary in English.

Directions for preparation of the dissertation are available from the Degree Progress Office in the Old Union. The signed dissertation copies and accompanying documents must be submitted to the Degrees Progress Office on or before the quarterly deadline indicated in the University’s academic calendar. A fee is charged for the microfilming and binding of the dissertation copies.

Registration is required for the term, or the immediately preceding term, in which the dissertation is submitted. The period between the last day of final exams of one term and the first day of the subsequent term is considered an extension of the earlier term. Students submitting a dissertation during this period would meet the registration requirement but would be eligible for degree conferred only in the subsequent term. At the time the dissertation is submitted, an Application to Graduate must be on file, all of the department requirements must be complete, and candidacy must be valid through the term of degree conferred.

DOCTORAL DISSERTATION READING COMMITTEE

The Doctoral Dissertation Reading Committee consists of the principal dissertation adviser and two or other readers. At least one member must be from the student’s major department. Normally, all members are on the Stanford Academic Council. The student’s department chair may, in some cases, approve the appointment of a reader who is not on the Academic Council, if that person is particularly well-qualified to consult on the dissertation topic and holds a Ph.D. or equivalent foreign degree.

Former Stanford Academic Council members, emeritus professors, and non-Academic Council members may serve on a reading committee. If they are to serve as the principal dissertation adviser, however, the appointment of a co-adviser who is currently on the Academic Council is required.

The reading committee, as proposed by the student and agreed to by the prospective members, is endorsed by the chair of the major department on the Doctoral Dissertation Reading Committee form. This form must be submitted before approval of Terminal Graduate Registration (TGR) status or before scheduling a University oral examination that is a defense of the dissertation. The reading committee may be appointed earlier, according to the department timetable for doctoral programs. All subsequent changes to the reading committee must be approved by the chair of the major department.

Ph.D. MINOR

Students pursuing a Ph.D. may pursue a minor in another department or program to complement their Ph.D. program. This option is not available to students pursuing other graduate degrees. Ph.D. candidates cannot pursue a minor in their own major department or program.

Except for a Ph.D. minor in Applied Linguistics and Social Science History, only departments that offer a Ph.D. may offer a minor, and those departments are not required to do so. The minor should represent a program of graduate quality and depth, including core requirements and electives or examinations. The department offering the minor establishes the core and examination requirements. Elective courses are planned by the students in conjunction with their minor and Ph.D. departments.

The minimum University requirement for a Ph.D. minor is 20 units of course work at the graduate level (courses numbered 200 and above). If a minor department chooses to require those pursuing the minor to pass the Ph.D. qualifying or field examinations, the 20-unit minimum can be reduced. All of the course work for a minor must be done at Stanford.

Units taken for the minor can be counted as part of the overall requirement for the Ph.D. of 72 units of graduate course work done at Stanford, but cannot be counted as part of the 36 unduplicated units for the Ph.D.
itself. Courses used for a minor may not be used also to meet the requirements for a master’s degree.

A Ph.D. minor form outlining a program of study must be approved by the major and minor departments. This form is submitted at the time of admission to candidacy and specifies whether representation from the minor department on the University oral examination committee is required.

ADVISING AND CREDENTIALS

ADVISING

By the start of their first term, students should be paired by the department with faculty advisers who assist them in planning a program of study to meet degree requirements. The department should also ensure that doctoral students are informed in a timely fashion about procedures for selecting a dissertation adviser, reading committee members, and orals committee members. Departments should make every effort to assist doctoral students who are not admitted to candidacy in finding an appropriate adviser.

Students are obliged to follow department procedures for identifying advisers and committee members for their dissertation reading and orals examinations.

Occasionally, a student’s research may diverge from the area of competence of the adviser, or irreconcilable differences may occur between the student and the faculty adviser. In such cases, the student or the faculty adviser may request a change in assignment. If the department decides to grant the request, every effort must be made to ensure that the student is paired with another suitable adviser. This may entail some modification of the student’s research project.

In the rare case where a student’s dissertation research on an approved project is in an advanced stage and the dissertation adviser is no longer available, a new adviser must be appointed, usually from the student’s reading committee. This may also require that a new member be added to the reading committee before the draft dissertation is evaluated, to keep the reconstituted committee in compliance with the University requirements for its composition.

PUBLIC SCHOOL CREDENTIALS

Stanford University acts as agent for the California Commission on Teacher Credentialing in recommending students for credentials for service in California public schools upon completion of a Stanford approved program. The University offers complete training programs for the Single Subject Teaching Credential and the Preliminary Administrative Services Credential.

The student expecting to complete the fifth-year requirement for a teaching credential must submit a proposed course of study to the Credential Office in the School of Education at the beginning of the first quarter of study.
Academic Policies and Statements

COMPLIANCE WITH UNIVERSITY REGULATIONS

Registration as a student constitutes an agreement by the student to abide by University regulations, including those concerning admissions, registration, academic performance, student conduct, public health, use of the libraries, operation of vehicles on campus, University facilities, and the payment of fees and assessments. Many of these regulations are set forth in this bulletin while others are available in relevant University offices.

Graduate students should also take responsibility for informing themselves in particular of University policy on intellectual property, environmental health and safety, and scientific misconduct. These policies are described in the Research Policy Handbook and the Graduate Student Handbook.

The University reserves the right to withhold registration privileges or to require the withdrawal of any student who is not in compliance with its regulations.

ACADEMIC INSTRUCTIONAL USE OF VERTEBRATE ANIMALS

It is the policy of Stanford University that the use of either live or deceased vertebrate animals for solely instructional purposes is permitted (1) when the cognizant instructor(s) judges that the educational goals of the program or course are best achieved by such usage, and (2) when the Administrative Panel on Laboratory Animal Care determines that such usage is humane, proper, and appropriate and that it is consistent with government principles and regulations for the utilization and care of vertebrate animals used in teaching and research. Only the minimum number of animals essential to instructional objectives should be used. Instructors should be encouraged to use alternatives to animals whenever feasible.

INFORMATION TO STUDENTS

Academic departments and programs should alert prospective students if any courses required for a major or degree involve the use of animals. This requirement may be met by a statement to the effect that some required courses for certain degrees may involve the use of animals or animal tissue and that interested students should seek further information about such requirements from the department.

Instructors must inform their students during the first week of class if animals or animal tissue will or may be used as part of that course. Students who have concerns about the use of animals may then choose whether or not to take the class. Students should feel free to discuss their concerns with the instructor, but they should be aware that instructors and departments are not obligated to alter course requirements that are consistent with University policies.

PROCEDURES FOR USE OF ANIMALS

Any faculty member who intends to use vertebrate animals for teaching purposes must submit an Animal Use Protocol, signed by the department chair, to the Administrative Panel on Laboratory Animal Care. Reuse of previously preserved material requires no approval. Courses taught each year with no significant changes in animal usage must submit a Renewal Animal Use Protocol every year.

The protocol must include information about the sources from which animals are procured. In addition, the protocol must explain why animals are needed to achieve the goals of the course and must justify the species and the number of animals to be used. Questions from the Administrative Panel on Laboratory Animal Care regarding the species of animal chosen, the procurement process, the number of animals to be used, or other related matters must be resolved before the animals may be ordered.

Live vertebrate animals must be cared for according to Federal, State, or local regulations, and Stanford University policies and practices relevant to the use of laboratory animals. Disposal of animal tissue must be in compliance with relevant health and safety regulations.

REGISTRATION AND RECORDS

REGISTRATION AND STUDY LISTS

Students register for each term by submitting a Registration Commitment through the mail, in person, or through the computerized registration system, Axess. No student may attend any classes without a valid student identification card.

As early as possible, but no later than the second Sunday of the quarter, students (including those with TGR status) must submit to the Registrar’s Office, via Axess, a study list to enroll officially in classes for the quarter. Students may not enroll in more units than their tuition charge covers, nor enroll in courses for zero units unless those courses, like TGR, are defined as zero-unit courses. Undergraduate students are subject to academic load limits described in the “Amount of Work” section below.

The University reserves the right to withhold registration from, and to cancel the advance registration or registration of, any student having unmet obligations to the University.

For full registration procedures, see the quarterly Time Schedule.

STUDY LIST CHANGES

Students may add courses or units to their study lists through the end of the third week of classes. (Individual faculty may choose to close their classes to new enrollments at an earlier date.) Courses or units may be added only if the revised program remains within the normal load limits.

Courses may be dropped by students through the end of the fourth week of classes, without any record of the course remaining on the student’s transcript. No drops are permitted after this point, regardless of the grade or notation recorded in the course.

A student may withdraw from a course after the drop deadline through the end of the eighth week of each quarter. In this case, a grade notation of “W” (for “Withdrew”) is automatically recorded on the student’s transcript for that course. Students who do not officially withdraw from a class by the end of the eighth week are assigned the appropriate grade or notation by the instructor to reflect the work completed.

Through the end of the sixth week of classes, students may elect the grading option of their choice in courses where the option of letter or Credit/No Credit grading is offered.

If the instructor allows a student to take an "I" (incomplete) in the course, the student must make the appropriate arrangements for that with the instructor by the last day of classes.

These policies reflect changes adopted by the Faculty Senate on June 2, 1994 which were effective Autumn Quarter 1995-96. The deadlines described above follow the same pattern each quarter but, due to the varying lengths of Stanford’s quarters, they may not always fall in exactly the week specified. Students should consult the Time Schedule for the deadline dates each term.

REPEATED COURSES

Students may not enroll in courses for credit for which they received either Advanced Placement or transfer credit.

Some Stanford courses may be repeated for credit; they are specially noted in this bulletin. Most courses may not be repeated for credit. Under the general University grading system, when a course which may not be repeated for credit is retaken by a student, the following special rules apply:

1. A student may retake once any course on his or her transcript (regardless of grade or notation earned), or from which she or he withdrew, and have the original grade or notation replaced by the notation 'RP' (repeated course). When retaking a course, the student must enroll in
it for the same number of units originally taken. Upon completion of
the retake, units for the first occurrence are automatically lowered to
zero, the grade is changed to an 'RP,' and the second occurrence is
flagged on the student's transcript to indicate that it is a repeated
course.
2. The student may not retake the same course again (for a third time),
unless he or she received a 'NC' (No Credit), 'NP' (Not Passed), or
'W' (Withdraw) when it was taken the second time. Upon comple-
tion of the third attempt, the units for the first and second time are
automatically lowered to zero. The third attempt appears on the tran-
script with its units, grade, and the special flag to indicate that it is a
repeated course.

These policies reflect changes adopted by the Faculty Senate on June

AMOUNT OF WORK

The usual amount of work for undergraduate students is 15 units per
quarter; 180 units are required for graduation. Registration for fewer than
12 units is rarely permitted and may cause the undergraduate to be inel-
igible for certification as a full-time student. The maximum is 20 units
(21 if the program includes a 1-unit activity course). The maximum may
be exceeded only for compelling reasons. A past superior academic per-
formance is not considered to be sufficient justification for exceeding the
maximum. Petitions for programs of fewer than 12 or more than 20 units
must be signed by the student's adviser and submitted to the Office of
Academic Standing, Old Union, room 141. For additional information
regarding satisfactory academic progress, refer to the "Academic Stand-
ing" section of this bulletin.

Graduate students are normally expected to enroll in no more than 24
units; registration for more than 24 units must be approved by the depart-
ment. Under certain circumstances, graduate students may register on a
part-time basis. See the "Tuition, Fees, and Housing" section of this
bulletin.

During the eight-week Summer Quarter, 16 units is the maximum for
all students. For details, see the Stanford University bulletin, Summer

UNIT OF CREDIT

Every unit for which credit is given is understood to represent approx-
imately three hours of actual work per week for the average student. Thus,
in lecture or discussion work, for 1 unit of credit, one hour per week may
be allotted to the lecture or discussion and two hours for preparation or
subsequent reading and study. Where the time is wholly occupied with
drawing, field, or laboratory work, or in the classroom work of conver-
sation classes, three full hours per week through one quarter are expect-
ed of the student for each unit of credit; but, where such work is supple-
mented by systematic outside reading or experiment under the direction of
the instructor, a reduction may be made in the actual drawing, field,
laboratory, or classroom time as seems just to the department.

AUDITING

No person shall attend any class unless he or she is a fully registered
student enrolled in the course or meets the criteria for auditors. Auditors
are not permitted in courses that involve direct participation such as lan-
guage or laboratory science courses, fieldwork, art courses with studio
work, or other types of individualized instruction. Auditors are expect-
ed to be observers rather than active participants in the courses they at-
tend, unless the instructors request attendance on a different basis.
Stanford does not confer credit for auditing; nor is a permanent record
kept of courses audited.

In all cases of auditing, the instructor's consent and the Registrar's
approval are required. Further information is available from the Regis-
trar's Office.

WITHDRAWAL FOLLOWING REGISTRATION

Students who wish to withdraw from the current quarter, or from a
quarter for which they have registered in advance and do not wish to at-
tend, must file a leave of absence petition with the Registrar's Office.
More information is available in the "Refunds" section of this bulletin
and, for graduate students, in General Requirements in the "Graduate
Degrees" section of this bulletin.

RECORDS

TRANSCRIPTS

Transcripts of Stanford records are issued by the Registrar's Office
upon the student's request when submitted in writing or via the online
Axess system. There is no charge for official transcripts. The courses
taken and grades given in one quarter will not appear on any student's
transcript until all grades received by the grade deadline have been re-
corded; generally, this is two weeks after final exams. The University
reserves the right to withhold transcripts or records of students with un-
met obligations to the University.

CERTIFICATION OF ENROLLMENT OR DEGREES

The Registrar's Office can provide oral or written confirmation of
registration, enrollment, or degree status. The printed certification can
be used whenever enrollment or degree verification is required for car
insurance, loan deferments, medical coverage, scholarship purposes, and
so on. Using Axess, students are able to order an official certification,
at no charge, that can be picked up at the Registrar's Office on the next
business day. Certification of full- or part-time enrollment cannot be
provided until after the quarterly study list is filed.

Degrees are conferred quarterly, but diplomas are issued at the Com-
 mencement exercises which are held only in June. After conferral, the
degree awarded to a student can be verified by contacting the Registrar's
Office for an official transcript, a certification form, or an oral confirma-
tion via telephone. Requests for transcripts must be made by the student
in writing or through Axess.

Full-time enrollment for undergraduates is considered to be enroll-
ment in a minimum of 12 units of course work per quarter at Stanford.
Work necessary to complete units from previous quarters will not count
toward the 12 units necessary for full-time status in the current quarter.
Enrollment in 8 to 11 units is considered half-time enrollment. Enroll-
ment in 1 to 7 units is considered less-than-half-time, or part-time enroll-
ment.

All undergraduate students who are considered to be in good standing for the purposes of enrollment certification
Stanford uses the following definitions to certify the enrollment sta-
tus of graduate students each quarter:

Full-time: 9 or more units
Half-time: 6, 7 or 8 units
Part-time: 5 or fewer units

Registered TGR students are certified as fulltime.

Only information classified by the University as directory informa-
tion (see below) can be confirmed to inquirers other than the student.

PRIVACY OF STUDENT RECORDS

NOTIFICATION OF RIGHTS UNDER FERPA

The Family Educational Rights and Privacy Act (FERPA) affords
students certain rights with respect to their education records. They are:
1. The right to inspect and review the student's education records with-
in 45 days of the date the University receives a request for access.

The student should submit to the Registrar, Dean, chair of the
department, or other appropriate University official, a written request
that identifies the record(s) the student wishes to inspect. The Uni-
versity official will make arrangements for access and notify the stu-
dent of the time and place where the records may be inspected. If the
records are not maintained by the University official to whom the
request was submitted, that official shall advise the student of the
correct official to whom the request should be addressed.
2. The right to request the amendment of the student's education records
that the student believes are inaccurate or misleading.

A student may ask the University to amend the record that he or
she believes is inaccurate or misleading. The student should write the
University official responsible for the record, clearly identify the part
of the records he or she wants changed, and specify why it is inaccurate or misleading.

If the University decides not to amend the record as requested by the student, the University will notify the student of the decision and advise the student of his or her right to a hearing regarding the request for amendment.

Additional information regarding the hearing procedures will be provided to the student when notified of the right to a hearing.

3. The right to consent to disclosures of personally identifiable information contained in the student’s education records, except to the extent that FERPA authorizes disclosure without consent.

One exception which permits disclosure without consent is disclosure to school officials with legitimate educational interests. A school official is a person employed by the University in an administrative, supervisory, academic or research, or support staff position (including law enforcement unit personnel and health staff); a person or company with whom the University has contracted (such as an attorney, auditor, or collection agent); a person serving on the Board of Trustees; or a student serving on an official committee, such as a disciplinary or grievance committee, or assisting another school official in performing his or her tasks. A school official has a legitimate educational interest if the official needs to review an education record in order to fulfill his or her professional responsibility.

Another exception is that the University discloses education records without consent to officials of another school, in which a student seeks or intends to enroll, upon request of officials at that other school.

4. The right to file a complaint with the U.S. Department of Education concerning alleged failures by the University to comply with the requirements of FERPA.

The name and address of the office that administers FERPA is: Family Policy Compliance Office, U.S. Department of Education, 400 Maryland Avenue, SW, Washington, DC, 20202-4605.

DIRECTORY INFORMATION

The University respects the following items of information as “directory information,” that is, information that the University may make available to any person upon specific request (and without student consent):

- Name
- Date of birth
- Place of birth
- Directory address and phone number
- Electronic mail address
- Mailing address
- Campus office address (for graduate students)
- Secondary mailing or permanent address
- Residence assignment and room or apartment number
- Specific quarters or semesters of registration at Stanford
- Stanford degree(s) awarded and date(s)
- Major(s), minor(s), and field(s)
- University degree honors
- Institution attended immediately prior to Stanford
- Photographs for University classroom use

Students may prohibit the release of any of these items listed above by designating which items should not be released on the Privacy function of Axess.

Students, faculty, and others with questions regarding student records should contact the Registrar’s Office.

CONSENT TO USE OF PHOTOGRAPHIC IMAGES

Registration as a student and attendance at or participation in classes and other campus and University activities constitutes an agreement by the student to the University’s use and distribution (both now and in the future) of the student’s image or voice in photographs, videotapes, electronic reproductions, or audiotapes of such classes and other campus and University activities.

If any student in a class where such photographing or recording is to take place does not wish to have his or her image or voice so used, the student should raise the matter in advance with the instructor.

STANFORD UNIVERSITY ID NUMBER

The Stanford University ID is a number assigned to each student’s academic record for unique identification. It is printed on the Stanford University ID card and on documents distributed by the Registrar’s Office and other administrative offices.

SUNET ID

The SUNet ID provides access to the Stanford University Network (SUNet) and its services, and identifies authorized users of these services. Each member of the Stanford electronic community creates a unique SUNet ID and password for him/herself.

SUNET IDs provide:

- Axess services
- Email service
- Storage space within Stanford’s distributed file system
- Usenet newsgroups
- World Wide Web services, including serving of personal web pages on the Leland system and access to Stanford Web Resources

IDENTIFICATION CARDS

ID cards are available to registered students, faculty, and regular staff through the Office of the Registrar, Old Union.

Married students or students with a domestic partner (same or opposite sex) may obtain a courtesy identification card for their spouse/partner through the Registrar’s Office, Old Union. The spouse/partner card enables use of some campus services during terms for which the student is registered.

Similar courtesy cards are also available to the spouses and same-sex partners of faculty and regular staff.

PERSONAL IDENTIFICATION NUMBERS

Students eligible to use on-line services such as Axess, obtain a PIN through the Registrar’s Office. The PIN, coupled with the assigned University identification number, uniquely identifies the student and serves in a place of a signature on electronic forms. The PIN and SUNet ID password must remain confidential. It is a violation of University policy to use another’s PIN or identification number to misrepresent yourself in any way. Use of another student’s PIN or SUNet ID password can result in loss of student privileges or other disciplinary action.

EXAMINATIONS

MIDTERMS

Classes that give midterm examinations outside of regular class hours must: (1) announce the date and time during the first week of the academic quarter, and (2) provide reasonable alternative times to those students for whom these announced times are not convenient. According to Honor Code interpretations and applications, different examinations may be given at these alternative times.

END-QUARTER POLICY STATEMENT

The End-Quarter Period is a time of reduced social and extracurricular activity preceding final examinations. Its purpose is to permit students to concentrate on academic work and to prepare for final examinations.

In Autumn, Winter, and Spring quarters, End-Quarter starts seven full days (to begin at 12:01 a.m.) prior to the first day of final exams. In Spring Quarter, final examinations begin on Friday; no classes are held on Thursday, the day before. In Summer Quarter, this consists of the weekend and the four class days preceding the final examinations, which take place on Friday and Saturday of the eighth week. (See the Time Schedule for dates.)
During the End-Quarter Period, classes are regularly scheduled and assignments made; this regular class time is used by instructors in whatever way seems best suited to the completion and summation of course material. Instructors should neither make extraordinary assignments nor announce additional course meetings in order to “catch up” in course presentations that have fallen behind. They are free, however, and even encouraged to conduct optional review sessions and to suggest other activities that might seem appropriate for students preparing for final examinations.

No graded homework assignments, mandatory quizzes, or examinations should be given during the End-Quarter Period except:

1. In classes where graded homework assignments or quizzes are routine parts of the instruction process.
2. In classes with laboratories where the final examination will not test the laboratory component. In such a case, the laboratory session(s) during the End-Quarter Period may be used to examine students on that aspect of the course.

Major papers or projects about which the student has had reasonable notice may be called due in the End-Quarter Period.

Take-home final examinations, given in place of the officially scheduled in-class examination, may be distributed in the End-Quarter Period. Although the instructor may ask students to return take-home examinations early in the final examination period, the instructor may not call them due until the end of the regularly scheduled examination time for that course. Such a policy respects the principle that students’ final examinations are to be scheduled over a period of several days.

End-quarter examinations may not be held during this period. This policy preserves the instruction time for courses and protects the students’ opportunities for extensive review and synthesis of their courses.

During the End-Quarter Period, no musical, dramatic, or athletic events involving compulsory student participation may be scheduled, unless approved as exceptions by the Committee on Academic Appraisals and Achievement, nor may routine committee meetings be scheduled (such as those of the ASSU, the Senate of the Academic Council, or the committees of the President of the University) when such meetings normally would involve student participation.

Note—Students who believe that there are faculty who are violating End-Quarter policy should contact the Registrar’s Office.

END-QUARTER EXAMINATIONS

Examinations are part of the process of education at the same time that they are a means to measure the student’s performance in course work. Their structure, content, frequency, and length are to be determined in accordance with the nature of the course and the material presented in it, subject only to the limitations contained herein.

Great flexibility is available regarding the types of examinations that an instructor may choose to employ. Examinations, including final examinations, may be, for example, in-class essay examinations, take-home essay examinations, objective examinations, oral examinations, or appropriate substitutes such as papers or projects. Instructors may use any type of examination, paper, or project, or any combination thereof, guided only by the appropriateness of the types of examinations, papers, or projects for the material upon which the student is being examined.

When the final examination is an in-class examination, the following regulations apply:

1. A three-hour period is reserved during examination week for the final examination in each course of more than 2 units. This examination period must be available for students, but not necessarily in its entirety, if an in-class examination is given. In courses with extraordinary meeting times, such that ambiguity might exist as regards the period reserved for the final examination, the schedule should be clarified and students informed no later than the end of the second week of the quarter.
2. Examinations in 1- or 2-unit courses must be completed by the end of the last class meeting before the End-Quarter Period, except in Summer Quarter when examinations must be completed during the last regularly scheduled class session.

When the final examination or its appropriate substitute is not an in-class examination (for example, when an instructor chooses to employ a take-home examination, paper, or project in lieu of an in-class examination), the following regulations apply:

1. The schedule and format of the final examination or its appropriate substitute shall be made known not later than the end of the second week of the quarter and, if changed subsequently, may be only an option of the plan originally announced by the instructor.
2. Although the instructor may ask students to return take-home examinations early in the final examination period, the instructor may not call them due until the end of the regularly scheduled examination time for that course.

In submitting official Study Lists, students commit to all course requirements, including the examination procedures chosen and announced by the course instructor. In selecting courses, students should take cognizance of the official schedule of final examinations announced in the quarterly Time Schedule. Students anticipating conflicts in final examination schedules should seek to resolve these with the instructors involved before submitting Study Lists at the end of the second week of the quarter. If accommodation cannot be made at that time, the student should revise his or her Study List in order to be able to meet the required final examination.

If unforeseen circumstances prevent the student from sitting for the regularly scheduled examination, instructors should make alternative arrangements on an individual basis. Such unforeseen circumstances include illness, personal emergency, or the student’s required participation in special events approved as exceptions by the Committee on Academic Appraisal and Achievement (for example, athletic championships).

STATEMENT CONCERNING EARLY EXAMINATIONS

Students are reminded that taking final examinations earlier than the scheduled time is a privilege, not a right. They should request this privilege only in the event of extraordinary circumstances.

Since the final examination schedule is published quarterly in the Time Schedule at the time of course selection and enrollment, students are expected to make their academic plans in light of known personal circumstances that may make certain examination times difficult for them.

In general, faculty members are discouraged from giving final examinations earlier than the published and announced times. If faculty nevertheless decide to administer early examinations, either the questions should be completely different from those on the regularly scheduled examination or the early examination should be administered in a highly controlled setting. An example of such a setting would be a campus seminar room where the examination questions would be collected along with students’ work and students would be reminded of their Honor Code obligations not to share information about the examination contents. Giving students easy opportunities to abuse the integrity of an examination is unfair to honest students and inconsistent with the spirit of the Honor Code.

Academic fields differ in the degree to which early examination requests present dilemmas for faculty. If, for example, an examination format consists of a small number of essay questions, where students would be greatly advantaged by knowing the question topics, faculty should be especially reluctant to allow early examinations unless they are willing to offer totally different examinations or a different kind of academic task, for example, a final paper in lieu of an examination.

GRADING SYSTEMS

GENERAL UNIVERSITY

The general University grading system is applicable to all schools of Stanford University except the Graduate School of Business, the School of Law, and M.D. students in the School of Medicine. Note that the GPA (grade point average) and rank in class are not computed under the gen-
eral University grading system. Stanford does use an internal-only GPA which is based on units completed up to the time of conferral of the first bachelor's degree. This information is used for the internal purposes only and is not displayed on the official transcript which is sent outside the University. Note also that, as to graduate students, there may be departmental requirements as to grades that must be maintained for purposes of satisfactory progress.

DEFINITION AND EXPLANATION

The following reflects changes adopted by the Faculty Senate on June 2, 1994 and effective Autumn Quarter 1995-96. All grades/notations for courses taken in 1995-96 or later are to be visible on student transcripts.

A Excellent
B Good
C Satisfactory
D Minimum pass
(Plus (+) and minus (-) may be used as modifiers with the above letter grades)
NP Not Passed
NC No Credit (unsatisfactory performance, 'D+' or below equivalent, in a class taken on a satisfactory/no credit basis)
CR Credit (student-elected satisfactory; A, B, or C equivalent)
S No-option Satisfactory; A, B, or C equivalent
L Pass, letter grade to be reported
W Withdrawn
N Continuing course
I Incomplete
RP Repeated Course
* No grade reported

The notation 'NC' represents unsatisfactory performance in courses taken on a satisfactory/no credit basis. Performance is equivalent to letter grade 'D+' or below.

NP The notation 'NP' is used by instructors in courses taken for a credit/no credit basis. It is recorded when a student withdraws from a course. The 'NP' notation is not changed to another grade at the request of the student.

CR In a course for which some students will receive letter grades, the 'CR' represents performance that is satisfactory or better than the minimum pass grade and the student has elected the 'CR' grading option. This option is available in any course, subject to the consent of the instructor and department and to the student's observance of the time limit for electing or dropping the option (the end of the sixth week of the quarter).

S For an activity course or a course in which the instructor elects to grade students only on a satisfactory/no credit basis, the 'S' represents performance that is satisfactory or better. For such courses, no letter grades may be assigned for satisfactory completion of work.

GENERAL

The back of the End-Quarter Report (EQR) sheet shall carry only information explaining the significance of the various forms of entries described therein and a calendar for required submission of grades. No description of a "curve" system shall appear on EQR sheets, and instructors are discouraged from assigning grades according to any predetermined distribution system.

A student who takes a course in a school or program of the University other than the one in which he or she is matriculated is subject to the grading system of the school or program in which the course is given.

REPORTING OF GRADES

All grades must be reported within 96 hours after the time and day reserved for the final examination, and in no case later than noon of the fourth day (including weekends) after the last day of the final examination period.

In the case of degree candidates in Spring Quarter, final grades must be reported within 24 hours of the end of the final examination period.

REVISION OF END-QUARTER GRADES

When duly filed in the Registrar's Office, end-quarter grades are final and not subject to be revised except for a revision of judgment on the instructor's part; nor are passing grades to be revised on the basis of a second trial (for example, a new examination or additional work undertaken or completed after the date of the End-Quarter Report). Changes may be made at any time to correct an actual error in computation or in transcribing, or where some part of the student's work has been uninten-
tionally overlooked; that is, if the new grade is the one that would have been entered on the original report had there been no mistake in computing and had all the pertinent data been before the instructor, the change is a proper one.

If a student questions an end-quarter grade based on the grading of part of a specific piece of work (for example, part of a test) on the basis of one of the allowable factors mentioned in the preceding paragraph (for example, an error in computation or in transcribing, or work unintentionally overlooked, but not matters of judgment as mentioned below), the instructor may review the entire piece of work in question (for example, the entire test) for the purpose of determining whether the end-quarter grade was a proper one. In general, changing an end-quarter grade is permitted on the basis of the allowable factors already mentioned whether an error is discovered by the student or the instructor; however, changing a grade is not permitted by reason of revision of judgment on the part of the instructor.

In the event that a student disputes an end-quarter grade, the established grievance procedure should be followed (see the “Statement on Student Academic Grievance Procedures” section of this bulletin).

**GRADUATE SCHOOL OF BUSINESS**

Effective September 2000, subject to approval by the Faculty Senate, all courses offered by the Graduate School of Business will be graded according to the following five-level scheme:

- **H** Honors. Work that is of truly superior quality.
- **HP** High Pass. A passing performance, and one that falls approximately in the upper quarter of passing grades.
- **P** Pass. A passing performance that falls in the center of the distribution of all passing grades.
- **LP** Low Pass. A passing performance that falls approximately in the lower quarter of passing grades.
- **U** Unsatisfactory. A failing performance. Work that does not satisfy the basic requirements of the course and is deficient in significant ways.

Students in some GSB courses may elect to take the course on a pass/fail basis, where any passing grade (H, HP, P, or LP) is converted to Pass, and U is converted to Fail. Students wishing to take a GSB course on a pass/fail basis should consult the GSB Registrar for rules and procedures.

**SCHOOL OF LAW**

The two grading systems previously employed at the School of Law were revised effective September 1983. Under the letter grade systems (with numerical equivalents), the range of satisfactory grades runs from 4.3 to 2.3 as outlined in the following distribution. Below the grade of 2.3 is one level of restricted credit (R=2.2) and one level of failure (F=2.1). The letter grades and numerical equivalents are as follows:

- A+ 4.3
- A 4.0
- A- 3.7
- B+ 3.3
- B 3.0
- B- 2.7
- C+ 2.3
- C 2.0
- C- 1.7
- D+ 1.3
- D 1.0
- D- 0.7
- F 0.0

"N" is a temporary notation used in a continuing course; it is replaced with a final grade upon completion of the course series.

Students may elect to take a limited number of courses on a credit/ restricted credit/no credit system (K/RK/NK). "K" shall be awarded for work that is comparable to numerical grades 4.3 to 2.3, "RK" for R-level work (2.2), and "NK" for F-level work (2.1). A limited number of courses are offered on a mandatory credit (KM)/no credit basis.

**SCHOOL OF MEDICINE**

In general, the following grades are used in reporting on the performance of students in the M.D. program:

- **Pass** Indicates that the student has demonstrated to the satisfaction of the department or teaching group responsible for the course that he or she has mastered the material taught in the course.

- **Fail** Indicates that the student has not demonstrated to the satisfaction of the department or teaching group responsible for the course that he or she has mastered the material taught in the course.

**Incomplete** Indicates that extenuating medical or personal circumstances have prevented the student from completing the course requirements. This grade shall be given when requested by the student with the prior approval of the Dean for Student Affairs in the School of Medicine.

**Exempt** Indicates a course that is exempted by examination. No units are awarded for courses completed.

A "Fail" grade can be cleared by repeating and passing the particular course or by other arrangement prescribed by the department or teaching group. An "Incomplete" grade can be made up in a manner specified by the department or teaching group within a reasonable time; if the deficiency is not made up within the agreed-upon time, the "Incomplete" grade becomes a "Fail" grade. The opportunity to clear a "Fail" grade or an "Incomplete" grade cannot be extended to individuals who are not registered or eligible to register as students in the M.D. program. For more specific information, see the School of Medicine bulletin.

---

**STATEMENT ON STUDENT ACADEMIC GRIEVANCE PROCEDURES**

The following policy was effective beginning in the 1999-2000 academic year and is subject to periodic review.

1. **Coverage**
   a) Any Stanford undergraduate or graduate student or postdoctoral fellow who believes that he or she has been subjected to an improper decision on an academic matter is entitled to file a grievance to obtain an independent review of the allegedly improper decision, followed by corrective action if appropriate. A grievance is a complaint in writing made to an administrative officer of the University concerning an academic decision, made by a person or group of persons acting in an official University capacity, that directly and adversely affects the student or postdoctoral fellow as an individual in his or her academic capacity.
   b) Grievance procedures apply only in those cases involving a perceived academic impropriety arising from decision taken by: (1) an individual instructor or researcher; (2) a school, department, or program; (3) a committee charged to administer academic policies of a particular school, department, or program; (4) the University Registrar or a Senate committee or subcommittee charged to administer academic policies of the Senate of the Academic Council. They do not pertain to complaints expressing dissatisfaction with a University policy of general application challenged on the grounds that the policy is unfair or inadvisable, nor do they pertain to individual school, department, or program academic policies, as long as those policies are not inconsistent with general University policy.
   c) Individuals should be aware that the University Ombudsman’s Office is available to all Stanford students, postdoctoral fellows, faculty, and staff to discuss and advise on any matter of University concern and frequently helps expedite resolution of such matters. Although it has no decision-making authority, the Ombudsman’s Office has wide powers of inquiry, including into student complaints against instructors.

2. **Grievance and Appeal Procedures**
   a) **Informal Attempts at Resolution:** the student or postdoctoral fellow first should discuss the matter, orally or in writing, with the individual(s) most directly responsible. If no resolution results, the student or postdoctoral fellow should then consult
with the individual at the next administrative level, for example, the chair or director of the relevant department or program, or, for those cases in which there is none, with the school dean. At this stage, the department chair or program director, if any, may inform the dean that the consultation is taking place and may solicit his or her advice on how to ensure that adequate steps are taken to achieve a fair result. Efforts should be made to resolve the issues at an informal level without the complaint escalating to the status of a formal grievance.

b) The Filing of the Grievance:
1. If informal means of resolution prove unsatisfactory, the student or postdoctoral should set forth in writing a statement of the decision that constitutes the subject matter of the dispute, the grounds on which it is being challenged, and the reasons why the grievant believes that the decision was improperly taken. The statement should also include a description of the remedy sought and the informal efforts taken to date to resolve the matter. It is at this point that the complaint becomes a formal grievance. The written grievance should specifically address the matters set forth in the Standards for Review, as stated in Section 4 below. The grievance should include an allegation of any adverse effects on the grievant, known to the grievant at the time of filing.

2. The grievance document should be submitted to the dean of the school in which the grievance arose; for a grievance concerning a decision of the University Registrar or of a Senate committee or subcommittee, the procedures set forth herein for grievances and appeals shall be modified as stated in Section 3 below. A grievance must be filed in a timely fashion, that is, normally within 30 days of the end of the academic quarter in which the adverse decision occurred or should reasonably have been discovered. A delay in filing a grievance may, taking all circumstances into account, constitute grounds for rejection of the grievance.

3. If the grievant is dissatisfied with the disposition of the grievance, the dean may, in appropriate cases, remand the grievance to a lower administrative level (including to the level at which the grievance arose) for further consideration.

4. Should attempts to resolve the matter informally not be successful, the Provost shall decide the appeal, and shall notify the grievant (and the party against whose decision the grievance has been filed) in writing of any referral of the matter and report to the Provost as the latter directs. The Provost may also, in appropriate cases, remand the matter to a lower administrative level (including to the level at which the grievance arose) for further consideration.

f) The Request to the President: if the student or postdoctoral fellow is dissatisfied with the disposition of the appeal by the Provost, he or she may write to the President of the University giving reasons why he or she believes the grievance result to be wrong (following the general format set forth in Section 2d above). No more than 30 days should elapse between the transmittal of the Provost’s disposition and the written statement to the President urging further appeal. In any case, the President may agree or decline to entertain this further appeal. If the President declines to entertain the further appeal, the decision of the Provost shall be final. If the President decides to entertain the further appeal, he or she shall follow the
general procedures set forth in Section 2e above, and the decision of the President shall be final.

3. Grievances Concerning Decisions of the University Registrar or of a Senate Committee or Subcommittee
   a) For a grievance concerning a decision of the University Registrar or of a Senate committee or subcommittee, the grievant shall file his or her grievance with the Provost, rather than with the dean, and the Provost shall handle that grievance in accordance with the procedures set forth in Section 2c above.
   b) There shall be no appeal of the Provost's disposition of that grievance, except as may be available under Section 2f above.

4. Standards for Review and Procedural Matters
   a) The review of grievances or appeals shall usually be limited to the following considerations:
      1. Were the proper facts and criteria brought to bear on the decision? Were improper or extraneous facts or criteria brought to bear that substantially affected the decision to the detriment of the grievant?
      2. Were there any procedural irregularities that substantially affected the outcome of the matter to the detriment of the grievant?
      3. Given the proper facts, criteria, and procedures, was the decision one which a person in the position of the decision maker might reasonably have made?
   b) The time frames set forth herein are guidelines. They may be extended by the relevant administrative officer in his or her discretion for good cause.
   c) Questions concerning the filing and appeal of grievances should be directed to the Office of the Provost.
COURSES OF INSTRUCTION

2000-01

Unless otherwise specified, courses numbered from 1 through 99 are primarily for first- and second-year undergraduates; courses numbered from 100 through 199 are for third- and fourth-year undergraduates; and those from 200 through 699 are for graduate students.

Amendments to course offerings announced in the Stanford Bulletin are found in the Time Schedule, issued quarterly.

Starting Autumn Quarter 1996, a new set of undergraduate degree requirements went into effect. In this edition of the Stanford Bulletin, a special notation follows each course description if the course can fulfill a requirement under the 1996 set of General Education Requirements or under the set of Distribution Requirements in effect Autumn 1991 through the end of the 1995 academic year. The 1991 set of requirements are designated within parentheses. Thus a course marked GER:2a may be used only towards the Natural Sciences sub-area within Area 2 of the new General Education Requirements. A course marked (DR:5) may be used only towards the Area 5 Natural Sciences requirement under the older 1991 set of Distribution Requirements. A course marked GER:2a (DR:5) has been approved to fulfill either requirement.

The Appendix of this bulletin presents a comprehensive list of courses certified as fulfilling a requirement under the 1996 system of General Education Requirements or the 1991 Distribution Requirements system.

Undergraduates fulfilling requirement sets in effect prior to 1991 should consult the Registrar's Undergraduate Degree Coordinator for information about whether a course may be applied to the requirement set applicable to them. Graduate students should ignore the various markings since such requirements do not apply to them.

SUMMER SESSION

Summer session courses are eight weeks in length, except in certain departments that offer ten-week courses.

This bulletin includes, for the Summer Session, only those courses that can be tentatively scheduled at publication time by each department. For the complete list of courses and faculty, refer to the Stanford University bulletin, Summer Session Catalogue, 2001, issued in January.
GRADUATE SCHOOL OF BUSINESS

Dean: Robert L. Joss
Senior Associate Deans: David M. Kreps, George G. C. Parker, Joel M. Podolny, Daniel N. Rudolph
Associate Dean: Joan M. Karlin
Assistant Deans: Christina Einstein, Marie Mookini, Jeffrey H. Moore, Sherrie Taguchi

Associate Professors: William P. Barnett, Peter M. DeMarzo, Steven R. Grenadier, Timothy J. Groseclose, Deborah H. Guenfeld, Pamela Haunschild, Chip Heath, Ron Kasznik, Daniel P. Kessler, Sunil Kumar, James M. Lattin, Michael W. Morris, Manju Puri, Sven Rady, Andrea Shepard, Stefanos Zenios, Jeffrey H. Zweibel

Professor (Teaching): George G. C. Parker

Consulting Professor: H. Irving Grousbeck

Visiting Professors: Terry L. Anderson, Henri-Claude de Bettignies, Robert B. Cialdini, Rajiv Grover, Debra E. Meyerson, John H. Roberts

Visiting Associate Professors: Katherine J. Klein, Richard K. Lyons, Edward F. McQuarrie

Visiting Assistant Professor: Seema Arora

The Graduate School of Business provides graduate education for careers in management, research, and teaching.

The two-year Master of Business Administration (M.B.A.) degree program is designed for the student preparing for a general management career. No specific undergraduate major or courses are required for admission, although prospective applicants are encouraged to have two or more years of managerial experience and to include some mathematics and economics in their undergraduate programs. Curricular options within the M.B.A. program include a certificate in Public Management or Global Management, the joint J.D./M.B.A. degree, and dual master's degrees in business and engineering.

The Stanford Sloan Program is an intensive one-year course of study for middle management executives leading to the degree of Master of Science in Management. Participants must be sponsored by their company and have demonstrated superior achievement.

Those interested in college teaching and research are served by the Doctor of Philosophy program.

For detailed information on programs, curricula, and faculty, write to the Graduate School of Business, Stanford University, Stanford, California 94305-5015 for the current bulletin.
School of Earth Sciences

Dean: Franklin M. Orr, Jr. (on leave, Autumn)
Acting Dean: Stephan A. Graham (Autumn)

The School of Earth Sciences includes the departments of Geological and Environmental Sciences, Geophysics, and Petroleum Engineering. The interschool Earth Systems Program offers study of the geological and biological processes that operate on global scales and how they interact with international environmental issues and policies. An honors program in Environmental Science, Technology, and Policy is also available through the Institute for International Studies.

The aims of the school are (1) to prepare students for careers in the fields of environmental studies, engineering, geology, geochemistry, geomechanics, geophysics, geostatistics, hydrogeology, petroleum engineering, and petroleum geology; (2) to conduct research in the Earth sciences; and (3) to provide opportunities for Stanford undergraduates to learn about our planet’s history, to understand the natural energy and resource base that underlies our economy, and to appreciate the geological and geophysical hazards that affect human societies, as well as those factors that contribute to the quality of our environment.

To accomplish these objectives, the school offers a variety of programs adaptable to the needs of the individual student: a four-year undergraduate program leading to the degree of Bachelor of Science (B.S.); a five-year program leading to the coterminous Bachelor of Science and Master of Science (M.S.), combining degrees in Earth sciences, social sciences, physical sciences, or engineering; and a graduate program offering the degrees of Master of Science, Engineer, and Doctor of Philosophy as described below. Details of individual departmental degree programs are found in the section for each department. In addition, it is possible for an undergraduate to develop an individually designed major in the Earth Sciences.

UNDERGRADUATE PROGRAMS

Any undergraduate student admitted to the University may declare a major in one of the Earth science departments or the interschool Earth Systems Program by contacting the appropriate department or program office. Students interested in creating an individually designed major should visit the dean’s office.

Specific requirements for the B.S. degree are listed in each department or program section. Departmental academic advisers work with students to define a career or academic goal and assure that the student’s curricular choices are appropriate to the pursuit of that goal. Advisers can help devise a sensible (and enjoyable) course of study that meets degree requirements and provides the student with opportunities to experience advanced courses, seminars, and research projects. To maximize such opportunities, students are encouraged to complete basic science and mathematics courses in high school or during their freshman year.

Each department (as well as Earth Systems) offers an honors program that involves research during the senior year. Each department also offers an academic minor for those undergraduates majoring in compatible fields.

COTERMINAL BACHELOR'S AND MASTER'S DEGREES

The Stanford coterminous degree plan enables an undergraduate to embark on an integrated program of study leading to the master’s degree before requirements for the bachelor’s degree have been completed. This may result in more expeditious progress toward the advanced degree than would otherwise be possible, making the program especially important to Earth scientists because the master’s degree provides an excellent basis for entry into the profession. The coterminous plan permits students to be admitted to a graduate program as early as their eighth quarter at Stanford, or after earning 105 units, and no later than the eleventh quarter.

Under the plan, the student may meet the degree requirements in the more advantageous of the following two ways: by first completing the 180 units required for the B.S. degree and then completing the three quarters required for the M.S. degree; or by completing a total of 15 quarters during which the requirements for the two degrees are completed concurrently. In either case, the student has the option of receiving the B.S. degree upon meeting all the B.S. requirements or of receiving both degrees at the end of the coterminous program. Students earn degrees in the same department (including Earth Systems), in two different departments, or even in different schools; for example, a B.S. in Physics and an M.S. in Geological and Environmental Sciences. Students are encouraged to discuss the coterminous program with their advisers during their junior year. Additional information is available in the individual department offices.

GRADUATE PROGRAMS

Admission to the Graduate Program—A student who wishes to enroll for graduate work in the school must be qualified for graduate standing in the University and in addition must be accepted by one of the school’s three departments. One requirement for admission is submission of scores on the verbal and quantitative sections of the Graduate Record Exam. Admission to one department of the school does not guarantee admission to other departments.

Faculty Adviser—Upon entering a graduate program, the student should report to the head of the department who will arrange with a member of the faculty to act as the student’s adviser. The student, in consultation with the adviser, then arranges a course of study for the first quarter and ultimately develops a complete plan of study for the degree sought.

Financial Aid—Detailed information on scholarships, fellowships, and research grants is available from the school’s individual departments. Applications should be filed by the various dates listed in the application packet for awards that become effective in Autumn Quarter of the following academic year.

EARTH SYSTEMS PROGRAM

Director: Pamela Matson
Advisory Committee: David Ackerly (Biological Sciences), Kevin Arrigo (Geophysics), Carol Boggs (Biological Sciences), Brendan Bohannan (Biological Sciences), Mark Denny (Biological Sciences, Hopkins Marine Station), Robert Dunbar (Geological and Environmental Sciences), Gary Ernst (Geological and Environmental Sciences), Walter Falcon (Institute for International Studies), Scott Fendorf (Geological and Environmental Sciences), Deborah Gordon (Biological Sciences, Lawrence Goulder (Economics, Institute for International Studies), Elizabeth Hadly (Biological Sciences), Donald Kennedy (Biological Sciences, Institute for International Studies), Julie Kennedy (Earth Systems), Jeffrey Koseff (Civil and Environmental Engineering), Anthony Kovscek (Petroleum Engineering), Gilbert Masters (Civil and Environmental Engineering), Pamela Matson (Geological and Environmental Sciences, Institute for International Studies), Michael McWilliams (Geological and Environmental Sciences), Stephen Monismith (Civil and Environmental Engineering), Harold Mooney (Biological Sciences), Rosamond Naylor (Institute for International Studies), Franklin Orr, Jr. (Dean, School of Earth Sciences), Adina Paytan (Geological and Environmental Sciences), Joan Roughgarden (Biological Sciences), Stephen Schneider (Biological Sciences, Institute for International Studies), Jonathan Stieblits (Geological and Environmental Sciences), James Sweeney (Management Science and Engineering), Barton Thompson (Law), Peter Vitousek (Biological Sciences), Virginia Walbot (Biological Sciences), Mark Zoback (Geophysics)
Senior Lecturer and Academic Coordinator: Julie Kennedy
The Earth Systems Program is an interdisciplinary environmental studies major. Students learn about and independently investigate complex environmental problems caused by human activities in interaction with natural changes in the Earth System. Earth Systems majors become skilled in those areas of science, economics, and policy needed to tackle the globe’s most pressing environmental problems, becoming part of a generation of scientists, professionals, and citizens who approach and solve problems in a new way: a systematic, interdisciplinary way.

For our students to be effective contributors to the solutions of such problems, their training and understanding must be both broad and deep. To this end, Earth Systems students take courses in the fundamentals of biology, calculus, chemistry, geology, and physics, as well as in computer science, economics, policy, and statistics. After completing breadth training in these areas, students concentrate on advanced course work in one of six focus areas: biology, energy, environmental economics and policy, geology, land management, or oceanography. Along with formal course requirements, all Earth Systems students complete a 9 unit (270 hour) internship. The internship provides a “hands-on,” rigorous academic experience working on a supervised field, laboratory, government or private sector project of their choice.

The following is an outline of the sequential knowledge and skills needed in this major.

1) The fundamental components of the Earth Systems: these help students understand current environmental problems against the backdrop of natural change.

   Training in the fundamentals comes through introductory course work in geology, biology, and economics. Depending on the Earth Systems track chosen, training may also include introductions to the study of the energy systems, microbiology, oceans, or soils. As students begin to question the role that humans play in affecting these systems, they find that many programs and departments at Stanford offer courses that approach this question from different directions. The department encourages students to come to the Earth Systems Office for course selection advice or to pick up a current list of environmental courses at Stanford.

2) The fundamental interactions among the physical, biological, and human components of the Earth System: these must be understood in order to understand and solve environmental problems.

   Several Earth Systems courses introduce students to the dynamic and multiple interactions that characterize global change problems. They include the introductory course, Introduction to Earth Systems, and three core courses, the Biosphere, the Geosphere, and the Anthroposphere.

   Competence in understanding system-level interactions is critical to development as an Earth Systems thinker, so additional classes that meet this objective are excellent choices as electives. More information on such classes is available in the program office.

3) To recognize, quantify, and report change in the environment, key analytical and computational tools and measurement systems are used for insight into global and regional environmental change, and are used to identify change and develop solutions.

   The test of an Earth Systems degree is the student’s ability to recognize, describe, quantify, and help solve complex problems that face our society. Through required cognates and specific track classes, students build skills in these areas. For example, training in satellite remote sensing and geographic information systems is either required or highly recommended for all tracks. Quantification of environmental problems requires solid training in calculus, linear algebra, physics, chemistry, programming, and statistics. These courses are required of all majors. Specialized training, such as in laboratory or field methods, may be necessary and is highly recommended.

   Having the ability to effectively communicate ideas and results is critical. Indeed, workable solutions to our environmental problems begin with common understanding of the issues. Writing intensive courses (WIM) help students to communicate complex concepts to expert and non-expert audiences alike. Stanford requires that each student complete one WIM course in his or her major. The Earth Systems major requires two writing intensive courses, Biosphere and Senior Seminar, with an option for a third course for coterminal master’s students through the Master’s Seminar. Oral communication skills are also a focus of the Senior Seminar and the Master’s Seminar.

4) To develop solutions to environmental problems that take into consideration natural processes as well as human needs, human needs must be met in a sustainable way.

   Many courses at Stanford focus on solutions. A comprehensive list of environmental courses, and advice on those that focus on problem solving, is available in the program office. Students can also review the quarterly Time Schedule for solution-based courses. Among others, the following departments may provide subject areas that are a useful guide: Anthropological Sciences, Biological Sciences, Civil and Environmental Engineering, Earth Systems, Economics, Geological and Environmental Sciences, Geophysics, Human Biology, International Policy Studies, International Relations, Latin America Studies, Law, Petroleum Engineering, Political Science, Public Policy, and Urban Planning. The Earth Systems Program emphasizes the importance of workable solutions in several ways, including a required 9-unit internship, knowledge synthesis in the Senior Seminar, and an optional upper division course on environmental problem solving.

   Students interested in Earth Systems should come to the program office for current information on our curriculum, alumni career paths, environmental jobs and internships, and undergraduate honors options. The Earth Systems Program provides a strong advising network that includes faculty, staff, and students.

**UNDERGRADUATE PROGRAMS**

**BACHELOR OF SCIENCE**

The B.S. in Earth Systems (ESys) requires the completion of at least 109 units that can be divided into three levels of courses. The student must complete a series of courses comprising a broad base of specialized study and must complete five required and three elective courses in that track. Finally, the student must carry out a senior-level research or internship project and participate in the senior seminar (WIM). Note: students interested in earning a California Teaching Credential for general high school science should contact the program office for specific guidelines.

**REQUIRED COGNATE COURSES**

**Biology (any one course below):**

* Biol. Sci. 51. Evolution, Genetics, and Ecology | 5 *
* or Biol. Sci. 52. Biochemistry, Molecular, and Cell Biology | 5 *

**Chemistry:**

* Chem. 31. Chemical Principles | 3 *
* Chem. 33. Organic Chemistry* | 4 *

**Computer Programming:**

* Comp. Sci. 106. Programming Methodology | 5 *
* or Comp. Sci. 138. Matlab and Maple for Science and Engineering Applications | 5 *

**Economics:**

* Econ. 1. Elementary Economics | 5 *
* Econ. 50. Economic Analysis I | 5 *

**Geological and Environmental Sciences:**

* Geol. & Envir. Sci. 1. Fundamentals of Geology | 4 *

**Mathematics:**

* Math. 19. Calculus and Analytic Geometry | 3 *
* Math. 20. Calculus and Analytic Geometry | 3 *
* Math. 21. Calculus and Analytic Geometry | 4 *
* or Math. 41. Calculus and Analytic Geometry | 5 *

49
Math. 42. Calculus and Analytic Geometry 5
and
Math. 51. Linear Equations and Differential Calculus 5
Probability and Statistics (any one course below):
Biol. Sci. 141. Biostatistics 4
Geol. & Envir. Sci. 160. Introduction to Statistical Methods for Earth and Environmental Sciences 4
Stat. 190. Statistics for Social Scientists 5
Physics:
Physics 41. Mechanics 4
Physics 47. Light and Heat* 4
(Additional physics cognate for Energy Track only)
Physics 43. Electricity 3

* Students may take either Physics 47 or Chem. 33; Biosphere students must take Chem. 33.

More extensive work in mathematics and physics may be expected for those planning graduate study. Graduate study in ecology and evolutionary biology and in economics requires familiarity with differential equations, linear algebra, and stochastic processes. Graduate study in geology and geophysics may require more physics and chemistry. Check with your advisor about recommendations beyond the requirements specified above.

TRACKS

GEOSPHERE

Geochemistry (choose one):
Geol. & Envir. Sci. 90. Introduction to Geochemistry 3
Geol. & Envir. Sci. 163. Introduction to Isotope Geology 3
Geol. & Envir. Sci. 170. Environmental Geochemistry 4
Geol. & Envir. Sci. 171. Geochemical Thermodynamics 3

Oceans/Atmosphere (choose one):
Geol. & Envir. Sci. 8. The Oceans: Introduction to the Marine Environment 3
Civ. & Envir. Engr. 63. Weather and Storms 3
Remote Sensing/GIS (choose one):
Geol. & Envir. Sci. 195. Integrating Remote Sensing and Geographic Information Systems 3
Geol. & Envir. Sci. 196. Introduction to GIS 2

Rocks/Minerals
Geol. & Envir. Sci. 80. Earth Materials 5

Surface Processes (choose one):
Geol. & Envir. Sci. 140. Geomorphology 3
Geol. & Envir. Sci. 151. Sedimentary Geology and Petrography 4-5

BIOSPHERE

Biol. Sci. 51. Evolution, Genetics, and Ecology 5
Biol. Sci. 52. Biochemistry, Molecular Biology, and Cell Biology 5
Biol. Sci. 53. Development and Physiology of the Organism 5
Biogeochemistry (choose one):
Biol. Sci. 124. Ecosystem Physiology 4
Biol. Sci. 216. Biogeochemistry/Ecosystem Ecology (same as Geol. & Envir. Sci. 220) 4
(See program office for new courses)
Geological Survey (choose one):
Biol. Sci. 144. Conservation Biology 4
or Biol. Sci. 173H. Marine Conservation Biology 3

Ecology (choose two):
Biol. Sci. 142. Principles of Ecology (same as Geophys. 176) 4
(See program office for new courses)

ANTHROSPHERE

Economics and Environmental Policy (choose three):
Econ. 51. Economic Analysis II 5
Econ. 102. Introduction to Econometrics 5
Econ. 106. The World Food Economy 5
Econ. 118. Economics of Development 5
Econ. 150. Economics and Public Policy 5
Econ. 160. Game Theory and Economic Application 5
Legal and Political Institutions and the Environment (choose one):
Econ. 154. Economics of Legal Rules and Policy 5

LAND MANAGEMENT

See program office for requirements.

ENERGY SCIENCE AND TECHNOLOGY

Civ. & Envir. Engr. 173B. The Coming Energy Revolution 3
Civ. & Envir. Engr. 176A. Energy Efficient Buildings 4
Civ. & Envir. Engr. 176B. Electric Power: Generation and Conservation 4
Esys 103. Energy Resources 3
or Esys 101. Energy and the Environment 3
Engr. 30. Engineering Thermodynamics 3

OCEANS

Physics of the Sea
Civ. & Envir. Engr. 164. Introduction to Physical Oceanography 4
Biological Oceanography (choose one):
Biol. Sci. 163H. Principles of Oceanic Biology 4
Geophys. 130. Biological Oceanography 4

Marine Chemistry
Geol. & Envir. Sci. 159. Marine Chemistry 3

Remote Sensing of the Ocean (choose one):
Geol. & Envir. Sci. 196. Introduction to GIS: Arc/Info and ARC-View 2
Geophys. 135. Remote Sensing of the Ocean 4
Coastal Ocean Dynamics: A Systems Approach
(See program office for new course information)

UPPER-DIVISION ELECTIVES

Three intermediate to advanced courses, 100-level or above, consistent with the primary track are required of all majors and are to be selected with the advice and consent of the adviser. Eligible upper-division electives are listed below. Additional courses may be selected; see the program office for the most current list.

GEOSPHERE TRACK

Esys 103. Energy Resources 3
Geol. & Envir. Sci. 110. Structural Geology 5-6
Geol. & Envir. Sci. 111. Structural Geology and Rock Mechanics 4
Geol. & Envir. Sci. 112. Structural and Engineering Geology II 2
Geol. & Envir. Sci. 164. Stable Isotopes 3
Geol. & Envir. Sci. 185. Volcanology 4
Geol. & Envir. Sci. 162. Cosmochemistry 3
Geol. & Envir. Sci. 220. Biogeochemistry 3
Geol. & Envir. Sci. 221. The Origins of the Solar System 3
Geol. & Envir. Sci. 223. Seminar in Environmental Problem Solving 3
Geol. & Envir. Sci. 254. Paleonanology 3
Geol. & Envir. Sci. 255. Introduction to Micropaleontology 5
Geol. & Envir. Sci. 257. Climate Variability 3

BIOSPHERE TRACK

Biol. Sci. 120. General Botany 5
Biol. Sci. 125. Ecosystems of California 3-4
Biol. Sci. 139. Biology of Birds 3
Biol. Sci. 184. Principles of Biosystematics 4
Biol. Sci. 161H. Invertebrate Zoology 5
Biol. Sci. 164H. Marine Botany 4
Biol. Sci. 217. Climate Theory, Modeling, Applications, and Implications 3
Biol. Sci. 283. Theoretical Populations Genetics 3
Geol. & Envir. Sci. 255. Introduction to Micropaleontology 5

ANTHROSPHERE TRACK

Anthro. Sci. 161. Conservation and Community Development in the Amazon 3-5
Civ. & Envir. Engr. 171. Environmental Planning Methods 4
Civ. & Envir. Engr. 266. Environmental Policy Design and Implementation 4
Econ. 158. Antitrust and Regulation 5
Econ. 165. International Economics 4
Econ. 243. Economics of the Environment 5
Geol. & Envir. Sci. 133. Introduction to Assessment of Environmental Risk 3
COTERMINAL B.S. AND M.S. DEGREES

The Stanford coterminal degree enables an undergraduate to embark on an integrated program of study leading to the master’s degree before requirements for the bachelor’s degree have been completed. An undergraduate majoring in Earth Systems may apply to work simultaneously toward B.S. and M.S. degrees. The M.S. degree in Earth Systems provides the student with enhanced tools to evaluate the primary literature of the discipline most closely associated with the student’s track and allows an increased specialization through additional course work that may include 9 units of thesis research. Integration of earth systems concepts is furthered by participation in the master’s seminar.

To apply, complete and return to the Earth Systems office an application that includes a statement of purpose, a Stanford transcript; two letters of recommendation, one of which must be from a faculty member of the program; and a list of courses that fulfill degree requirements signed by the student and the program advisor. The student must meet the following requirements:

1. All requirements for the B.S. degree.

2. Further course work (and/or thesis research), all of which should be at the 100-level or above, including 18 units at the 200-level or above, leading to further focus within the student’s track.

3. Participation in the master’s seminar.

The program consists of a minimum of 36 units of course work and/or thesis research, at least 18 of which must be at the 200-level or above.

The student must devise a program of study that shows a level of specialization appropriate to the master’s level, as determined in consultation with the adviser. At least 18 units must be at the 200-level or above.

The program should demonstrate further specialization and focus within the student’s undergraduate track.

With the adviser’s approval, 9 units may be in the form of research. This may culminate in the preparation of a master’s thesis; however, a thesis is not required for the degree. Master’s students must take part in the Winter Quarter master’s seminar (ESys 290) and have additional responsibilities appropriate to the master’s level (thesis presentation, modeling problems, and so on), 2 units.

A more detailed description of the coterminal master’s degree program may be obtained from the program office.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

UNDERGRADUATE

10. Introduction to Earth Systems—For non-majors and prospective Earth Systems majors. Multi-disciplinary approach to how the Earth works as a system, utilizing the tools of geology, biology, and economics to understand global change on all time scales. Topics: origin of the solar system and earth, paleoclimate and climate modeling, ocean-atmosphere circulation, extinction and speciation, energy and mineral resources, economic attitudes and the environment. Case studies: acid rain, hunger and food, policy and the environment. GER:2a (DR:5) 3-5 units, Win (Ernst)

101. Energy and the Environment—(Same as Petroleum Engineering 101.) Where the energy that powers society comes from, acknowledging that most current energy is generated from fossil resources. Case studies consider the consequences of current energy use patterns. Focus is on energy definitions, use patterns, resource estimation, pollution. Recommended: Mathematics 21 or 42, Engineering 30. 3 units, Spr (Kovscek)

103. Energy Resources—(Same as Civil and Environmental Engineering 173A.) Overview of oil, natural gas, coal, nuclear, hydro, solar, geothermal, biomass, wind, and ocean energy resources in terms of supply, distribution, recovery and conversion, environmental impacts, economics, policy, and technology. The opportunities for energy efficiency, electric power basics, the changing role of electric utilities, transportation basics, and energy use in developing countries. Field trip. Recommended: Civil and Environmental Engineering 70.

4 units, Aut (Woodward)

110. Geosphere—(Same as Geological and Environmental Sciences 120.) Geological processes, from local to global, affect people and civilization. The reverse is also true; civilization is beginning to influence the geosphere. The processes experienced at the earth’s surface (catastrophic earthquakes, volcanic eruptions, and longer term atmospheric and climate changes) are linked to what goes on in the earth’s deep interior. How geochemical, geophysical, and biological processes interact over time scales from 4.5 billion years to the nearly instantaneous. Topics: the origin and evolution of the atmosphere and oceans, heat flow and global tectonics and how they have changed over time, geochemical cycles, climate change, catastrophic impacts, and the roles played by organisms. Prerequisite: Geological and Environmental Sciences 1 or 2.

3 units, Aut (Paytan, Siebbins, McWilliams)
111. Biosphere—(Same as Biological Sciences 117.) The biological causes and consequences of anthropogenic and natural changes in the atmosphere, oceans, and terrestrial and freshwater ecosystems. Topics: glacial cycles and marine circulation, greenhouse gases and climate change, tropical deforestation and species extinctions, and human population growth and resource use. Prerequisites: Biological Sciences or Human Biology core, or graduate standing in any department.

3 units, Win (Matson, Vitousek, Mooney)

112. Anthroposphere: Human Interactions with the Earth and Environment—(Same as Economics 155.) The economic sources of environmental problems and the alternative policies for dealing with them (technology standards, emissions taxes, and marketable pollution permits). An evaluation of the policies addressing regional air pollution, global climate change, water allocation in the western U.S., and the use of renewable resources. The connections between population growth, economic output, environmental quality, and human welfare. Prerequisite: Economics 30.

5 units, Spr (Goulder)

124. The Global Environmental System—(Graduate students register for 224.) Among the effects of the expansion of population and economic activity in the 20th century were anthropogenic changes in the global environment. One of the admirable advances in human knowledge was the increase in understanding of the global environmental system. An overview of the functioning of the global environmental systems and society's impacts on the system, combining knowledge from different disciplines and using "systems thinking" as a framework for thinking about the global system.

2 units, Aut (Alcmao)

130. Biological Oceanography—(Same as Geophysics 130.) Interdisciplinary look at how oceanic environments control the form and function of marine life. Topics: distributions of planktonic production and abundance, nutrient cycling, the role of ocean biology in the climate system, an expected effect of climate changes on ocean biology. Local field trips on weekends. Prerequisites: Biological Sciences core, Geological and Environmental Sciences 8, or equivalent.

4 units, Spr (Arrigo)

135. Remote Sensing of the Ocean—(Same as Geophysics 135.) How to observe and interpret physical and biological changes in the oceans using remote technologies such as satellites and instrumented moorings. Topics: principles of satellite remote sensing, classes of satellite sensors and mooring platforms, converting radiometric data into biological quantities, sensor calibration and validation, interpreting large-scale oceanographic features. Prerequisites: Earth Systems 130 or Hopkins Marine 163H/263H.

4 units (Arrigo) alternate years, given 2001-02

147. Controlling Climate Change in the 21st Century—(Enroll in Human Biology 147.)

3 units, Aut (Schneider, Rosencrans)

150/240. Seminar in Sustainable Agriculture—The interactions of agriculture and environment and the range of meanings and approaches to sustainable agriculture. Topics: ecological, economic, institutional, and political aspects of sustainability as they pertain to a range of cropping systems. For 2 units: participation in team research evaluating current and potential sustainable agriculture approaches in specific global cropping systems. Group presentation on research findings.

1-2 units, Spr (Matson, Naylor, Kennedy) alternate years, not given 2001-02

159. Marine Chemistry—(Same as Geological and Environmental Sciences 159.) For upper-division undergraduates and graduate students in the earth, biology, and environmental sciences. The oceans are in interactive contact with the atmosphere, biosphere, and lithosphere, and virtually all elements pass through the ocean at some point in their cycles. The first-order processes take place within the sea, which affects its chemistry. What controls the distribution of chemical species in water and sediments? How long do different elements spend, on average, in the ocean? How do marine chemical processes interact with the biological, geological, and physical processes in the oceans? Prerequisite: Geological and Environmental Sciences 8, or the consent of the instructor.

3 units, Spr (Paytan)

164. Introduction to Physical Oceanography—(Same as Civil and Environmental Engineering 164.) Introduction to the dynamic basis of physical oceanography. Topics: a general description of the physical environment of the ocean; conservation equations for salt, heat, and momentum; geostrophic flows; wind-driven flows; the Gulf Stream; equatorial dynamics and ENSO; the thermohaline circulation of the deep oceans; and tides. Prerequisite: Physics 41.

4 units, Aut (Monismith)

166B. Fishing for Solutions: Issues in Marine Conservation—(Graduate students register for 266B, same as Anthropological Sciences 166B.) The stories behind communities and their fisheries relate to a resource we cannot see. The history of exploitation of cod, salmon, tuna, and grouper are instructive of the wider challenges facing marine resource management. The complex of cultural, biological, and economic facets that shape a fishery.

3-5 units, Win (Novy)

2-3 units (Thompson) not given 2000-01

3 units, Aut (Hewett)

189. Field Studies in Earth Systems—For advanced upper-division undergraduates and graduate students in Earth Systems, Biological Sciences, Geological and Environmental Sciences. Field-based, focusing on the components and processes by which terrestrial ecosystems function. Topics from geology, soil science, chemistry, biology, and ecology. Lecture, field, and lab studies emphasize standard field techniques, experimental design, analysis of data, and written and oral presentation. Small team projects test the original questions in the functioning of natural ecosystems. Admission by application, see Time Schedule. Prerequisites: Biological Sciences 141 or Geological and Environmental Sciences 160, or equivalent.

5 units, Spr (Ackerly, Chiarrello, Fendorf, Matson, E. Miller)

210. Senior Seminar in Earth Systems—Focus is on communication skills, oral and written. Each student presents results of the Earth Systems internship in an oral presentation and leads a follow-up round table discussion subsequent to talk. Group project analyzing local environmental problems requires an Earth Systems approach. Peer-reviews of internship papers as required. (WIM)

4 units, Aut, Spr (J. Kennedy)

223. Seminar in Sustainable Agriculture—(Same as Geological and Environmental Sciences 223.) For upper-division undergraduates and graduate students in the earth and biological sciences. Using case studies,
evaluates and contrasts the approaches that different natural and social science disciplines bring to environmental problem solving.

2-3 units (Matson, Naylor) alternate years, given 2001-02

250. Directed Research—Independent research into an aspect of earth systems related to the student’s primary track, carried out after the junior year, during the summer, and/or during the senior year. Student develops own project with faculty supervision, or can see adviser for research ideas. 10-15 page thesis required.

9 units, quarter by arrangement (Staff)

260. Internship—Supervised field, lab, private sector, or advocacy project, normally through an internship sponsored by government agencies, research institutions or other organizations, or independently developed by the student with the prior written approval of the academic coordinator. Provides hands-on experience within the student’s primary track. 10-15 page report required.

9 units, quarter by arrangement (J. Kennedy)

290. Master’s Seminar—Open to Earth Systems master’s students only. Focus is on critical examination and discussion of topics in Earth Systems. Requires independent research, oral presentation of results, and preparation of an original proposal for innovative Earth Systems science policy research.

2 units, Win (J. Kennedy)

298. Advanced Topics in Earth Systems—Open to Earth Systems master’s students only. Continuation of Winter Quarter master’s seminar.

2 units, Spr (J. Kennedy)

299. M.S. Thesis—Research in connection with the master’s paper.

1-9 units, any quarter (Staff)

GEOLOGICAL AND ENVIRONMENTAL SCIENCES

Chair: Jonathan F. Stebbins
Associate Chair: Stephen A. Graham
Associate Professors: Keith Loague, Michael O. McWilliams
Assistant Professors: Scott Fendorf, Adina Paytan
Professors (Research): Attila Aydin, J. Michael Moldovan
Associate Professor (Research): Christopher Chyba
Consortium Professors: Peter Brewer, David Clague, James O. Leckie
Consortium Associate Professors: Ronaldo I. Borja, Simon Klemperer, Debra Stokes
Consortium Assistant Professor: Kevin R. Arrigo
Senior Lecturer: George G. Mader
Consulting Professors: Richard Bernknopf, Paul Hsieh
Consulting Associate Professors: Joseph W. Ruets, Joseph Wooden
Visiting Professor: Dennis L. Corwin

* Joint appointment with Statistics
† Joint appointment with Geophysics
** Joint appointment with Petroleum Engineering
†† Joint appointment with Institute for International Studies
*** Recalled to active duty

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

The program leading to the Bachelor of Science degree in Geological and Environmental Sciences (GES) provides the background for a wide variety of careers. It prepares students for graduate studies in business administration, earth and environmental sciences, environmental engineering, land use planning, law, public service, and other professions in which an understanding of the earth and a background in science can be important. The geological sciences are broad and include study of the Earth’s history and the evolution of life; the oceans and atmosphere; the processes that shape the Earth’s mountains, continents, and landscape; the chemistry and physics of earth materials and their interactions with each other and with water; and sources of water, economic minerals, metals, and fuels. Within earth sciences, the environmental sciences emphasize the present and the future, particularly the ways in which humankind is affected by natural hazards such as volcanic eruptions and earthquakes and the ways in which we affect the planet and its viability by development, contamination of natural waters, and depletion of resources.

GES offers an undergraduate major leading to the bachelor’s degree in Geological and Environmental Sciences and three formal opportunities for specialization: Geological Sciences, Environmental Sciences, Engineering Geology, and Hydrogeology.

Students whose educational objectives are within the scope of the department, but not encompassed in a predefined program, may design an independent curriculum with the help of a faculty adviser and the approval of the department chair. All successful graduates receive the Bachelor of Science in GES. Students who enroll in a predefined program likewise may have the area of specialization designated as a field on their transcripts.

The Writing in the Major (WIM) requirement may be fulfilled by taking one of the following courses designated (WIM) for the larger unit total indicated: GES 110, 112, 151, 152, 185, 198 along with the 1-unit WIM Project course, GES 190. Students choosing to take a course for WIM credit should consult with the instructor early in the quarter; additional writing-intensive work is assigned.

GEOLOGICAL SCIENCES

The Geological Sciences curriculum leading to the B.S. degree in Geological and Environmental Sciences prepares students for professional careers and graduate studies in the earth sciences and other fields requiring an earth sciences background. The field of geological sciences is broad and involves the study of the physical and chemical processes that build continents, shape the earth's landscape, and determine the distribution of elements in minerals, rocks, soils, and natural waters; the oceans and atmosphere; Earth's history and the evolution of life; and the materials that constitute the earth, including those of economic importance. Geological sciences are also concerned with the ways in which society is affected by natural hazards (for example, volcanic eruptions, landslides, and earthquakes) and the ways in which society affects the planet (for example, the pollution of groundwater and depletion of resources).

An important emphasis of the B.S. program in the Geological Sciences curriculum is the study of earth processes and history in the natural laboratory of the field. Stanford University's location near the Pacific continental margin, the Sierra Nevada mountain range, and the San Andreas fault system provides a nearly unparalleled setting for field studies.

The field of geological sciences has evolved over the last two centuries from mostly observational and descriptive into a quantitative science dealing with the chemistry and physics of the earth and other planets and with interactions between the biological and physical systems of the earth. Thus, the Geological Sciences curriculum includes significant course work in chemistry, physics, and mathematics. The diversity of these requirements and experience results in graduates with versatility and a broad range of skills. The program is designed to recognize the diversity of this field and to provide a great deal of flexibility. A significant proportion of the required courses can be selected by the student in consul-
CORE COURSE SEQUENCE

Course No. and Subject Qtr. and Units
GES 1. Fundamentals of Geology A,W,S 5
  or GES 2,3. Earth History and Lab A 5
GES 80. Earth Materials A 5
GES 90. Introduction to Geochemistry W 3
GES 102. Introduction to Field Geology Sum 3
GES 110. Structural Geology S 5
  or GES 111. Structural Geology and Rock Mechanics A 4
GES 112. Mapping the Geologic Environment S 3
GES 151. Sedimentary Geology W
GES 152. Stratigraphy and Applied Paleoentology S 4
GES 160. Introduction to Statistical Methods for Earth and Environmental Science S 4
GES 181. Igneous and Metamorphic Processes S 3-5
GES 190. WIM Project A,W,S
Subtotal ........................................... 39-42

REQUIRED SUPPORTING SCIENCES AND MATHEMATICS

Course No. and Subject Qtr. and Units
Math. 20. Calculus W,S 3
Math. 21. Calculus S 4
Math. 41. Calculus* A 5
Math. 42. Calculus* A,W 5

Physics 22. Mechanics and Heat Lab A 1
Physics 23. Electricity and Optics W 1
Physics 24. Electricity and Optics Lab W 1
Physics 41. Mechanics† A 3
Physics 43. Electricity† W 1
Physics 45. Magnetism† S 3
Physics 46. Electricity and Magnetism Lab† S 1
Physics 47. Light and Heat† A 4
Subtotal ........................................... 30-36

* Math. 41, 42, 51 are recommended for students planning graduate study in the sciences or engineering.
† Physics 41, 43, 45, 47 are recommended for students planning graduate study in the sciences or engineering.

ELECTIVES

Choose four courses from the following list or, with faculty approval, four related, but more advanced courses:
Biol. Sci. 117. Biology and Global Change W 3
Chem. 33. Structure and Reactivity W,S,Sum
Comp. Sci. 106A. Programming Methodology A,W,S 5
GES 2, 3. Earth History and Lab (if not used above) A 5
GES 8. Oceans S 3
GES 140. Geomorphology W 3
GES 170. Environmental Geochemistry W 4
GES 185. Volcanology S 4-5
GES 187. Introduction to Ore Deposits A 4
GES 230. Physical Hydrogeology A 5
Geophys. 183. Interpretation of Seismic Reflection Profiles W 2-3

Geophys. 150. General Geophysics A 3-4
Subtotal ........................................... 11-20
Total .................................................. 81-98

ENVIRONMENTAL SCIENCES

Environmental Sciences in the School of Earth Sciences is concerned with the combined chemical, physical, and mathematical study of the outer crust of the earth and the hydrosphere as they are found today, and of the processes and stages through which our planet's surface has evolved. The program also deals with the impact of our use of land and natural resources, processes through which the earth may respond to human use, and the hazards these processes present to people on local and regional scales. In comparison, earth systems science focuses on some of the same topics on a global scale, and environmental engineering focuses on prevention, control, or mitigation of the negative aspects of human impact on the environment.

The Environmental Sciences curriculum provides a background in selected fundamental geological and physical sciences, basic quantitative analytical and problem-solving tools, and an introduction to the use of this background in anticipating, recognizing, and defining or diagnosing environmental problems. The primary focus is on earth sciences, the natural environment, and anthropogenic changes. Graduates should be equipped for positions in environmental consulting and remediation firms or government agencies or, with appropriate selection of electives, for graduate study in related fields including the geological sciences, environmental sciences or engineering, business or law, and others.

GES majors who elect the Environmental Sciences curriculum are expected to complete a core course sequence in supporting sciences and mathematics and a set of electives chosen from the prescribed list below. Substitutions for core and elective courses must be approved by the adviser and the department chair. Letter grades are required, if available, in all courses.

CORE COURSE SEQUENCE

Course No. and Subject Qtr. and Units
GES 1. Fundamentals of Geology A,W,S 5
GES 80. Earth Materials A 5
GES 90. Introduction to Geochemistry W 3
GES 102. Introduction to Field Geology Sum 3
GES 110. Structural Geology S 5
  or GES 111. Structural Geology and Rock Mechanics A 4
GES 112. Mapping the Geologic Environment S 4
GES 150. General Geophysics A 3-4
GES 151. Sedimentary Geology W
GES 152. Stratigraphy and Applied Paleoentology S 4
GES 160. Introduction to Statistical Methods for Earth and Environmental Science S 4
GES 170. Environmental Geochemistry W 4
GES 171. Geochemical Thermodynamics A 3
GES 172. Geochemistry S 4
GES 180. Fundamentals of Environmental Science S 4
GES 185. Volcanology S 4-5
GES 190. WIM Project A,W,S 1
GES 230. Physical Hydrogeology A
Subtotal ........................................... 45-46

REQUIRED SCIENCES AND MATHEMATICS

Course No. and Subject Qtr. and Units
Chem. 31. Chemical Principles A,W,Sum 4
Chem. 135. Physical Chemical Principles W 3
  or Chem. 171. Physical Chemistry A 3
  or GES 171. Geochemical Thermodynamics A 3

Choose one of the following groups of physics courses:
Physics 22. Mechanics and Heat Lab A 1
Physics 23. Electricity and Optics W 1
Physics 24. Electricity and Optics Lab W 1
Physics 41. Mechanics† A 3
Physics 43. Electricity† W 1
Physics 45. Magnetism† S 3
Physics 46. Electricity and Magnetism Lab† S 1
Physics 47. Light and Heat† A 4
Subtotal ........................................... 30-36

Choose one of the following groups of mathematics courses:
Math. 20. Calculus W,S 3
Math. 21. Calculus S 4

* Math. 41, 42, 51 are recommended for students planning graduate study in the sciences or engineering.
† Physics 41, 43, 45, 47 are recommended for students planning graduate study in the sciences or engineering.
The Department of Geological and Environmental Sciences offers a program leading to the Bachelor of Science in Geological and Environmental Sciences with honors. The program provides an opportunity for independent study and research on a topic of special interest culminating in a written report. The honors program is open to all seniors with a grade point average (GPA) of at least 3.5 in earth and environmental science courses and a minimum of 3.0 in all University course work. Modest financial support is available to help defray laboratory and field expenses incurred in conjunction with honors research. Students intending to pursue the honors program must submit an application to the department before the beginning of their senior year.

A student selects a research topic and prepares a research proposal in consultation with a faculty adviser or her or his choosing. Research undertaken for the honors program can be of a theoretical, field, or experimental nature, or a combination of these approaches.

Upon approval of the research proposal and formal entrance to the program, course credit for the honors research project and report preparation is assigned by the student's faculty adviser within the framework of GES 199; 3 units each quarter are assigned to the project for three quarters of the student's senior year for a total of 9 units. Research undertaken for the honors program cannot be used as a substitute for regularly required courses.

Both a written and an oral presentation of research results are required of honors students. A formal written report must be submitted to the student's research adviser no later than the fourth week of the student's final senior quarter. To graduate with honors, the report must be read, approved, and signed by the student's faculty adviser and a second member of the faculty. Before the end of the senior year, each honors candidate gives a public seminar on his or her research results.
The coterminal B.S./M.S. program offers a special opportunity for students to pursue a graduate research experience and a M.S. degree concurrently with or subsequent to their B.S. studies. The master's degree is viewed as an entrance professional degree in a number of subdisciplines within the earth sciences (for example, engineering geology, environmental geology). Alternatively, graduate course work and the master's research experience can provide an intermediate step prior to pursuit of the Ph.D. Regardless of their professional goal, coterminal B.S./M.S. students are treated as members of the graduate community and are expected to meet all of the standards set for regular M.S. students. Students should apply to the program after their seventh quarter (or after earning 105 units), but no later than their eleventh quarter. They are required to submit an application for entrance to the GES coterminal program including a statement of purpose, a copy of their current Stanford transcript, official Graduate Record Examination scores, letters of recommendation from two members of the Stanford faculty (at least one of whom must be in this department), and a list of courses in which they intend to enroll to fulfill degree requirements. Each student must complete a thesis or master's report describing the results of his or her research. Specific research interests should be noted in the statement of purpose and discussed with a member of the GES faculty prior to submission of an application to the coterminal program.

Graduate students in the Department of Geological and Environmental Sciences (GES) involve academic course work and independent research. Students are prepared for careers as professional scientists in research or the application of the earth sciences to mineral, energy, and water resources. Programs lead to the M.S., Engineer, and Ph.D. degrees. Course programs in the areas of faculty interest are tailored to the student's needs and interests with the aid of his or her research adviser. Students are encouraged to include in their program courses offered in other departments in the School of Earth Sciences as well as in other departments in the University. Diploma designate degrees in Geological and Environmental Sciences and may also indicate the following specialized fields of study: Geomathematics, Geostatistics in the Earth Sciences, and Hydrogeology.

The broad areas of faculty teaching and research are divided into three fields that have diploma designation and an additional six areas of specialization.

Admission—For admission to graduate work in the department, the applicant must have taken the Aptitude Test (verbal, quantitative, and analytical) of the Graduate Record Examination. In keeping with University policy, applicants whose first language is not English must submit TOEFL (Test of English as a Foreign Language) scores from a test taken within the last 18 months. Previously admitted students who wish to change their degree objective from M.S. to Ph.D. must petition the GES Admissions Committee.

**SCHOOL OF EARTH SCIENCES**

**COTERMINAL B.S./M.S. PROGRAM**

Hydrogeology—The Hydrogeology program, which leads to an M.S., Engineer, or Ph.D. degree in GES, balances research in the purely scientific and applied aspects of groundwater resources and near-surface processes. Key department faculty in hydrogeology are Professors Gorelick and Loague, but there are strong interactions with faculty in the departments of Civil and Environmental Engineering, Geophysics, and Petroleum Engineering and with scientists at the USGS. Investigations typically involve field sites and focus on topics ranging from understanding groundwater flow through large basins to optimal design of aquifer remediation strategies. The scales of interest extend from the domain of pores and fractures to vast regional flow systems. One important aim is to develop conceptual and quantitative predictive models. Such models enhance our understanding of the role of groundwater flow as a geologic process and provide means for evaluating and managing resources.

The program requires students to obtain a broad background in earth sciences and engineering. Students in the program must have a strong general scientific background in basic physics, chemistry, computer science, and mathematics, and a demonstrated aptitude for solving quantitative problems. They must complete a core curriculum involving courses in fluid mechanics, hydrogeology, hydrology, and water quality. A list of required and recommended courses is supplied upon request.

Geostatistics—The Geostatistics program, which leads to a M.S. or Ph.D. degree in GES, is under the direction of Professor Journel. It focuses on the probabilistic modeling of earth sciences phenomena such as oil reservoirs, ore deposits, and pollution sites in view of their development and management. As opposed to traditional mapping algorithms, stochastic imaging provides alternative, equiprobable, very high resolution numerical models of the phenomenon under study. These models integrate data from various sources such as well data, geophysical logs, and geological interpretation. Strong interactions have been developed with faculty and students in the departments of Geophysics and Petroleum Engineering.

The program requires a geological background and a fair level of calculus and programming (Fortran and/or C). Recent graduates have found jobs in the extractive (mining, oil) and environmental (EPA) fields.

Geomathematics—The Geomathematics program, under the direction of Professor Harbaugh, leads either to a M.S. or Ph.D. degree in GES. It focuses on the use of mathematics in simulating geologic processes in petroleum-bearing sedimentary basins. Geologic processes are represented in terms of their underlying physical principles by differential equations that have been placed in finite-difference form for numerical solution by computer. The numerical solutions are linked with graphics workstations to create dynamic three-dimensional displays, which are then used in simulating actual sedimentary basins.

Students in the program should have demonstrated aptitude for mathematics and computer programming. A list of required and recommended courses is supplied upon request.

**AREAS OF SPECIALIZATION**

Geochemistry, Petrology, and Mineralogy—The research and teaching interests of a number of the faculty in the Department of Geological and Environmental Sciences involve biogeochemistry, cosmochemistry, environmental geochemistry, geochronology and its applications in the atomic-level structure and properties of earth materials, hydrothermal systems, igneous and metamorphic petrology, mineralogy and mineral physics, mineral surface and colloid reactions, and ore deposits. Techniques include Ar-Ar, U-Pb, Sm-Nd, Rb-Sr, and U series geochronology; computer prediction and modeling; electron microprobe and sensitive high-resolution ion microprobe analysis; field-oriented studies; laboratory experiments at high temperatures and pressures on phase equilibria and mineral-fluid interactions; and x-ray scattering and spectroscopic studies of organic and inorganic earth materials. The scale of problems studied ranges from global to atomic. Students with strong backgrounds in chemistry are especially urged to contact faculty in these fields, including Professors Bird, Brown, Einaudi, Ernst, Fendorf, Ireland, Liou, Mahood, Matson, McWilliams, Moldovan, and Stebbins.
Structural Geology and Geomechanics (http://pangea.stanford.edu/geomech/index.html)—Research opportunities in this specialization include: engineering geology; geomechanics; hydraulics of faults and fractures; reservoir description and characterization; rock fracture and fault mechanics; and structural geology. Program advisers are Professors Aydin and Pollard. Correspondence with the advisers before application is suggested to clarify the nature and requirements of the program. Other faculty members with related research interests are: Professor Bird, Gorelick, Graham, Journel, Loague, Miller, and Moldovan (from GES); Professors Beroza, Klemperer, Makvo, Nur, Segall, and Zoback (from Geophysics); Professor Aziz, Durlovsky, Hewett, and Orr (from Petroleum Engineering); and Professor Borja (from Civil and Environmental Engineering).

One focus of the program is on characterizing and modeling physical processes responsible for geological structures. Topics include the evolution of crustal structures such as faults, folds, and fractures, and natural hazards related to earthquakes and volcanoes. Another focus is on the role of geologic structures (faults, folds, and fractures) in fluid flow in groundwater aquifers and petroleum reservoirs. This research is under the umbrella of the Rock Fracture Project, an industrial affiliates program.

The methodologies used in this program include field mapping of ancient or active structures; laboratory investigations using physical models; seismic mapping and interpretation of crustal subsurface structures; and theoretical analyses based on solid, fluid, and fracture mechanics. Research goals include delineating stress, strain, and displacement fields associated with geological structures at scales ranging from laboratory samples to plate boundaries, and understanding the geological and hydraulic properties of fractures and faults.

Sedimentary Geology, Paleoclimatology, Marine Geology, and Paleontology—Research in sedimentary geology at Stanford spans a wide range of specialized studies in modern and ancient settings. Sedimentary processes are studied at scales ranging from single sediment-gravity flows to the mechanisms by which continental margins form. Time-dependent phenomena are investigated at levels that range from the deposition and organic geochemical and paleoecological signatures of annually varved sediments to that of the fill of long-lived foreland basins. Venues span the globe from Asia, around the Pacific Rim to South America, and across to Africa in stratigraphic units that range from Archean to Recent; these are investigated with special focus on the tectonics, sedimentation, and paleoclimates of continental margins and sedimentary basins of the western U.S. These investigations employ the tools of many subdisciplines, including computer modeling/simulation, geochemistry, geochronology, micropaleontology, paleoecology, paleomagnetism, sedimentology, and seismic interpretation, with emphasis on interdisciplinary integration. Current projects include application of sedimentology to interpreting surface conditions and crustal evolution on the Archean earth, computer simulation of sediment flow and deposition, evolution of modern shallow carbonate depositional systems in the Gulf of California, organic geochemistry of paleoecological events such as El Niño, paleoecology and sedimentation of modern western Pacific marginal seas, research on the origins and evolution of sedimentary basins in Asia, sequence and seismic stratigraphic architecture of active margin basins, and sediment-gravity flow mechanisms and the structure of associated deposits. Core faculty are Dunbar, Graham, Ingle, Lowe, and Paytan; faculty with related or overlapping interests include Fendorf, Gorelick, Harbaugh, McWilliams, Miller, and Moldovan.

Structural Geology, Regional Geology, and Tectonics—Research in structural geology, regional geology, and tectonics overlaps the interests of many other research programs in the school and encompasses a broad spectrum of disciplines. Field-based studies address the evolution and deformation of continental crust and the relationship of plate tectonics to the genesis and evolution of mountain belts and sedimentary basins, with emphasis on the circum-Pacific region and North American Cordillera. The "AAR" and tectonics geochronology laboratories support studies aimed at understanding the thermal history of sedimentary basins and of igneous and metamorphic terranes, determining rates of geologic processes, and calibrating the geological and geomagnetic time scales. Geophysical studies include seismic imaging of the crust and mantle, stress and strain measurement in regions of active deformation, and paleomagnetic measurement of crustal deformation and continental accretion. Faculty with general interests in these topics include Professors Aydin, Ernst, Graham, McWilliams, Miller, and Pollard in Geological and Environmental Sciences, and Klemperer, Nur, Segall, Sleep, Thompson, and Zoback in Geophysics.

Surface and Aqueous Geochemistry—Professors Brown and Parks (emeritus) lead the Surface and Aqueous Geochemistry Group (SAAG) in the alteration and partitioning reactions that determine the mobility, bioavailability, and ultimate fate of solutes and contaminants in natural waters. Research focuses on the fundamental physical and surface/interfacial chemistry underlying reactions among water, aqueous solutes, and minerals under earth-surface conditions, and how the composition and structure of the solutions and mineral surfaces influence them. Students study speciation or complexation, dissolution, precipitation, and especially sorption reactions using a variety of classical surface chemistry and surface-sensitive spectroscopic methods, as well as computer simulations of the macroscopic and molecular-scale behavior of solutes and properties of solute-surface complexes. Results can be used to understand mechanisms of element partitioning and cycling in geochemical systems; they have applications in a wide variety of contexts including hazardous waste management, petroleum migration and recovery, remediation of contaminated sites, and weathering under the influence of acid rain.

SAAG students are expected to accumulate a sound background in physical and inorganic chemistry as well as geochemistry, and at least one field of application such as environmental engineering, environmental geosciences, or hydrogeology. Preference is given to applicants who have a strong quantitative background in chemistry and physical chemistry and experience with computers and laboratory methods.

Volcanology—Professors Aydin, Mahood, and Pollard have overlapping interests with Professors Segall and Zebker in Geophysics in the deformation of volcanic edifices; eruption triggers; explosive volcanism and emplacement of pyroclastic flows; formation of dikes, geologic evolution of caldera systems; magma degassing and impact of volcanic gases on the atmosphere; the physics of magma transport in the crust; magma reservoirs and sills; planetary volcanology; and seismic signatures of volcanic activity.

MASTER OF SCIENCE

Objectives—The purpose of the master’s program in Geological and Environmental Sciences is to continue a student’s training in one of a broad range of earth science disciplines and to prepare students for either a professional career or doctoral studies.

Procedures—The graduate coordinator of the department appoints an academic adviser during registration with appropriate consideration of the student’s background, interests, and professional goals. In consultation with the adviser, the student plans a program of course work for the first year. The student should select a thesis adviser within the first year of residence and submit to the thesis adviser a proposal for thesis research as soon as possible. The academic adviser supervises completion of the department requirements for the M.S. program (as outlined below) until the research proposal has been accepted; responsibility then passes to the thesis adviser. The student may change either thesis or academic advisers by mutual agreement and after approval of the graduate coordinator.

Requirements—The University’s requirements for M.S. degrees are outlined in the “Graduate Degrees” section of this bulletin. Practical training (GES 385) may be required by some programs, with adviser approval, depending on the background of the student. Additional department requirements include the following:

1. A minimum of 36 units of course work at the 100 level or above.
   a. Half of the courses used to satisfy the 36-unit requirement must be intended as being primarily for graduate students, usually at the 200 level or above.
   b. No more than 15 units of thesis research may be used to satisfy the 36-unit requirement.
c. Some students may be required to make up background deficiencies in addition to these basic requirements.

2. By the end of Winter Quarter of their first year in residence, students must complete at least three courses taught by a minimum of two different GES faculty members.

3. Each student must have a research adviser who is a faculty member in the department and is within the student’s thesis topic area or specialized area of study.

4. Each student must complete a thesis describing his or her research. Thesis research should begin during the first year of study at Stanford and should be completed before the end of the second year of residence.

5. Early during the thesis research period, and after consultation with the student, the thesis adviser appoints a second reader for the thesis, who must be approved by the graduate coordinator; the thesis adviser is the first reader. The two readers jointly determine whether the thesis is acceptable for the M.S. degree in the department.

DOCTOR OF PHILOSOPHY

Objectives—The Ph.D. is conferred upon candidates who have demonstrated substantial scholarship, high attainment in a particular field of knowledge, and the ability to conduct independent research. To this end, the objectives of the doctoral program are to enable students to develop the skills needed to conduct original investigations in a particular discipline or set of disciplines in the earth sciences, to interpret the results, and to present the data and conclusions in a publishable manner.

Requirements—The University’s requirements for the Ph.D. degree are outlined in the “Graduate Degrees” section of this bulletin. Practical training (GES 385) may be required by some programs, with adviser approval, depending on the background of the student. A summary of additional department requirements is presented below:

1. Ph.D. students must complete the required courses in their individual program or in their specialized area of study with a grade point average (GPA) of ‘B’ or higher, or demonstrate that they have completed the equivalents elsewhere. Ph.D. students must complete a minimum of four letter-grade courses of at least 3 units each from four different faculty members on the Academic Council in the University. By the end of Winter Quarter of their first year in residence, students must complete at least three courses taught by a minimum of two different GES faculty members.

2. Each student must qualify for candidacy for the Ph.D. by the end of the sixth quarter in residence, excluding summers. Department procedures require selection of a faculty thesis adviser, preparation of a written research proposal, approval of this proposal by the thesis adviser, selection of a committee for the Ph.D. qualifying examination, and approval of the membership by the graduate coordinator and chair of the department. The research examination consists of three parts: oral presentation of a research proposal, examination on the research proposal, and examination on subject matter relevant to the proposed research. The exam should be scheduled for prior to May 1, so that the outcome of the exam is known at the time of the annual spring evaluation of graduate students.

3. Upon qualifying for Ph.D. candidacy, the student and thesis adviser, who must be a department faculty member, choose a research committee that includes a minimum of two faculty members in the University in addition to the adviser. Annually, in the month of March or April, the candidate must organize a meeting of the research committee to present a brief progress report covering the past year.

4. Under the supervision of the research advisory committee, the candidate must prepare a doctoral dissertation that is a contribution to knowledge and is the result of independent research. The format of the dissertation must meet University guidelines. The student is strongly urged to prepare dissertation chapters that, in scientific content and format, are readily publishable.

5. The doctoral dissertation is defended in the University oral examination. The department appoints the research adviser and two other members of the research committee to be readers of the draft dissertation. The readers are charged to read the draft and to certify in writing to the department that it is adequate to serve as a basis for the University oral examination. Upon obtaining this written certification, the student is permitted to schedule the University oral examination.

Ph.D. MINOR

Candidates for the Ph.D. degree in other departments who wish to obtain a minor in Geological and Environmental Sciences must complete, with a GPA of ‘B’ or better, 20 units in the geosciences in lecture courses intended for graduate students. The selection of courses must be approved by the student’s GES adviser and the department chair.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

(AU) indicates that the course is subject to the University Activity Unit limitations (8 units maximum).

UNDERGRADUATE

1. Fundamentals of Geology—For non-majors or prospective majors in Earth Systems or Geological and Environmental Sciences. Introductions to and survey of the processes that shape the earth’s landforms, produce the minerals and rocks that comprise the earth, create soils, deform the earth’s crust, and move continents. Surficial processes involving water, wind, and ice, and their role in erosion and in the production of sediment. The processes acting within the earth’s interior, emphasizing global tectonics. How geologists determine the ages of rocks and geologic events. Geologic hazards: earthquakes, volcanic eruptions, flooding, landslides, and their mitigation. Nonrenewable resources, energy, environmental problems. Lectures, one all-day field trip, and weekly lab. Recommended: high school chemistry and physics. GER:2a (DR:5) 5 units, Aut (Mahood) Win (Ernst) Spr (Staff)

2. Earth History—For non-majors or prospective Earth Systems or geology majors. The earth is a dynamic planet, its surface continuously remodeled by changing patterns of plate movements, climatic variation, the rise and fall of sea level, mountain building, volcanism, erosion, and sedimentation. It has hosted an evolutionary parade of organisms, from self-replicating molecules to man, that have interacted with and strongly modified surrounding environments. The evolution of the earth and its biosphere, hydrosphere, and atmosphere represent active areas of current research and discussion. Topics: the formation of the earth, origin of life, evolution of the continents, oxygenation of the atmosphere, development of metazoans, history of glaciations and climate, the role of extraterrestrial events in geological and biological evolution. Non-required lab in GES 3 examines the materials and organisms discussed. Majors in geology must take 3 concurrently or in a subsequent year. $10 field trip fee required. GER:2a (DR:5) 3 units (Lowe) alternate years, given 2001-02

3. Earth History Laboratory—Introduction to the methods and materials of historical geology. Lab sessions on stratigraphic interpretation, geologic maps and cross sections, sedimentary environments, and metazoan evolution and fossils. Recommended for students taking GES 2;

3 units (Dunbar) alternate years, given 2001-02

42N. Stanford Introductory Seminar: Early Life on Earth—Preference to freshmen. An exploration of the first billion years of earth history, with emphasis on the environments, conditions, and processes that led to the origin of life on earth; the likelihood that life has evolved elsewhere in the solar system; examination and discussion of the geologic record of the oldest preserved life forms, and the environments in which they lived. Term paper. Use of Stanford’s of rock collection containing the oldest evidence for life on earth. GER:2a (DR:5)

3 units, Aut (Lowe) alternate years, not given 2001-02

43N. Stanford Introductory Seminar: Environmental Problems—Preference to freshmen. Groundwater contamination from point and nonpoint sources, cumulative watershed effects related to timber and mining practices, acid rain, subsurface disposal of nuclear waste, the Alaska pipeline, slope stability, and oil tanker spills.

3 units, Win (Loague)

44N. Stanford Introductory Seminar: Emerging Issues in Global Environmental Change—Preference to freshmen. Surveys the current understanding of environmental issues that are global in extent or effect, developing skills in searching primary literature and presenting the results of research in written and orally. Topics: atmospheric change, climate change, land use change, change in biotic resources, change in biogeochemistry, and the interaction of these changes with local and regional changes. Structure: six weeks of lecture/discussions focused on global changes and their causes and consequences at global and local scales; four weeks of oral presentations and discussions of student research. Team project exploring the social or natural science research in specific changes; students critique draft papers and give an oral presentation on their own research.

3 units (Matson) alternate years, given 2001-02

45N. Stanford Introductory Seminar: Environment Quality, is it Getting Better or Worse?—Preference given to freshmen. How do scientists address questions about environmental change? How do our governments set standards for environmental quality? What are some strategies for monitoring environmental quality? How can we distinguish between long term trends and random fluctuations? How can we predict the effects of national policy on environmental quality? What is the evidence for climate change over the past century? How do we predict the effects of climate change on society? The scientific tools and data needed to address these questions. Student pairs select a project area, assemble information, and provide oral progress reports and written final reports.

3 units, Win (Switzer) alternate years, not given 2001-02

46N. Stanford Introductory Seminar: The Beach—Preference to freshmen. Open coast beaches represent one of the most complex and dynamic natural environments of Earth; a triple point where the ocean, atmosphere, and continent meet and interact on time scales of seconds to millennia. The beach environment through lectures and reading, and by study in the field. Field work involves repeated measurement of waves, currents, and beach character and sample collection at sites from Point Reyes south to Monterey Bay, California, with the goals of assembling and analyzing a quantitative record of environmental change. Required papers on a specific aspect of the beach environment.

3 units (Ingle) alternate years, given 2001-02

47N. Stanford Introductory Seminar: “Secrets in the Mud”—A Look into the Field of Paleoenography—Preference to freshmen. The oceans have major effects on climate; understanding how the oceans operated and responded to natural perturbations in the past help us predict and plan for the potential consequences of changes humankind induces on the environment. The kinds of information deduced from marine sediments about Earth’s environment in the past. Student lab projects: sediment sample preparation and analysis, description and interpretation of data, and presentation as oral and written reports.

3 units, Win (Paytan) alternate years, not given 2001-02
48N. Stanford Introductory Seminar: Volcanoes of the Eastern Sierra Nevada—Preference to freshmen. Develop skills in researching primary sources in scientific literature and presenting the results of that research orally and in writing. Topics: young volcanoes, hot springs, earthquake faults, glacial features, paleoclimatology, and saline lakes of the eastern Sierra Nevada. Four-day field trip over the Memorial Day weekend. Term project is written as a chapter for a class-produced field trip guidebook. Students give an oral presentation on the outcrop at the field trip stop described in the guidebook chapter. Introduction to the basics of related geology. Camping and light hiking. GER: 2a (DR: 5)
3 units, Spr (Mahood) alternate years, not given 2001-02

49N. Stanford Introductory Seminar: Field Trip to Death Valley—Preference to freshmen. California's Death Valley and Owens Valley are natural laboratories for exploring a billion years of earth history: the sediments of ancient ocean's, large-scale crustal deformation and mountain building, recent earthquake faulting, and volcanic eruptions. Their desert environments reveal prehistoric climate changes and historic human impacts. Six-day field trip to these areas during Spring Break. Introduction to the basics of geology. Individual projects on specific topics are presented during the trip. Camping and moderate hiking required.
3 units, Win (Mahood, Miller)

50Q. Stanford Introductory Seminar: The Coastal Zone Environment—Preference to sophomores. The oceanographic, geological, and biological character of coastal zone environments, including continental shelves, estuaries, and coastal wetlands, with emphasis on San Francisco Bay. Five required field trips examine the estuarine and coastal environments of the Bay region, and agencies and facilities concerned with monitoring and management of these resources. Original research on a selected aspect of the coastal zone results in a written and oral report. Prerequisite: introductory course in the earth or biological sciences. GER:2a (DR:5)
3 units, Aut (Ingle)

52Q. Stanford Introductory Seminar: Geologic Development of California—Preference to sophomores, and to students who have completed introductory geology. Field-based, on the crustal evolution of California in post-Paleozoic time, and covering the geotectonic development of most of the state. Weekend field trips to the Diablo Range (two days); the central Klamath Mountains (three days); Point Lobos (one day); the White-Inyo Range, Owens Valley, and the eastern Sierra (three days). Camping and hiking.
4 units, Spr (Ernst)

53Q. Stanford Introductory Seminar: In the Beginning—Theories of the Origin of the Earth, Solar System, and Universe—Preference to sophomores. What happened in the first few seconds following the Big Bang? Where did all the elements in the periodic table come from? When and how did the Earth, Moon, and solar system form? When and where did life begin on Earth? Answers to these questions have been sought for centuries, and continues today. The history and evolution of theories of the origin of the Earth, Moon, solar system, and the Universe.
3 units, Win (McWilliams)

54Q. Stanford Introductory Seminar: California Landforms and Plate Tectonics—Preference to sophomores. The forces of plate tectonics at work on the landscape of California. The principles of rock deformation are introduced in hands-on experiments. Landforms resulting from deformation of the earth are analyzed with digital and photographic images. Field trips relate these large-scale structures to what one sees from the human perspective on the ground. Literature research on the tectonics of a region of the student’s choice. GER:2a (DR:5)
3 units, Aut (Miller)

55Q. Stanford Introductory Dialogue: The California Gold Rush—Geologic Background and Environmental Impact—Preference to sophomores, and to students who have completed introductory geology. The geologic processes that led to the concentration of gold in the river gravels and rocks of the Mother Lode region of California. The environmental impact of the Gold Rush population increase and of mining operations, including the effects of placer mining on the landscape, rivers, and fisheries, and the concentration of arsenic and mercury in surface sediments and soils due to hard rock mining and milling operations. Field trip to the Mother Lode region; term paper and oral presentation required.
2 units, Spr (Bird)

56Q. Stanford Introductory Dialogue: Change in the Coastal Ocean—The View from Monterey Bay—Preference to sophomores. The issue of recent changes in the California Current, using Monterey Bay as an example. Current literature is an introduction to several principles of oceanography. Visits from researchers from MBARI, Hopkins, and UCSC. Optional field trip to MBARI and Monterey Bay.
2 units, Spr (Dubar)

57Q. Stanford Introductory Seminar: How to Critically Read and Discuss Scientific Literature—Preference to sophomores. The ability to read and evaluate scientific primary literature is crucial for success in undergraduate or graduate school, or in the scientific work force. Topics: how to approach the reading of scientific articles, and how to understand and critically evaluate the information contained in them through guided and instructed reading, and a review of such papers.
3 units, Win (Paytan)

80. Earth Materials—Identification, classification, and interpretation of rock-forming minerals and the igneous, sedimentary, and metamorphic rocks they comprise. Rock cycles are related to earth systems. Lab work emphasizes use of the hand lens in making observations; overnight field trip demonstrates mineral and rock identification in the field, a variety of different pressure and temperature environments where minerals and rocks have formed, and genetic associations. Prerequisite: 1. Recommended: introductory chemistry.
5 units, Aut (Brown, Liou)

81. Petrography Tutorial—Practice in identifying minerals and rocks using a petrographic microscope. One three-hour lab per week. Prerequisite: 80 or equivalent.
2 units, Spr (Miller, Staff)

90. Introduction to Geochemistry—Introduction to the chemistry of the solid earth and its atmosphere and oceans, emphasizing the processes that control the distribution of the elements in the earth over geological time and at present, and on the conceptual and analytical tools needed to explore these questions. The basics of geochemical thermodynamics and isotope geochemistry. The formation of the elements, crust, atmosphere and oceans, global geochemical cycles, and the interaction of geochemistry, biological evolution, and climate. Recommended: introductory chemistry.
3 units, Win (Stebbins)

102. Introduction to Field Geology—Instruction and practice in the basic methods of geologic investigation in the field. Emphasis is on techniques of systematic observations and the construction of geologic maps and sections from the data obtained with a written geologic report on one of the study areas. Field area sites display a variety of rock types and landforms related to clearly defined geologic structures and events. Conducted from White Mountains Research Station in Bishop, CA for the two weeks preceding the beginning of Autumn Quarter. ContactGES, or see Summer Session Catalogue for schedule. Prerequisites: 1, 80.
3 units, Sum (Ruetz)

105. Geologic and Environmental Problems—Supervised reading, field and/or lab work; written reports thereon.
1-10 units, any quarter (Staff)
110. Structural Geology: Introduction to Deformation in the Earth’s Crust—The basic theory, principles, and techniques used to interpret and measure structures in naturally deformed rocks. Topics: the properties, rheology, and mechanisms of the deformation of rocks and minerals; techniques of data collection in the field; lab and computer analysis of structural data; geometry and development of faults and folds; interpretation of geologic maps and construction of geologic cross-sections; strain measurement and structural analysis of metamorphic tectonites; the evolution of mountain belts, formation of rift-related sedimentary basins, and development of strike-slip fault systems. Prerequisites: 1, calculus. Recommended: 80, 102. (WIM) 
5 units, Spr (Miller)

111. Structural Geology and Rock Mechanics—(Same as Civil and Environmental Engineering 195.) Observational techniques, analysis methods, and the theoretical foundations of structural geology, engineering geology, and rock mechanics. Computer exercises are integrated with field data to understand the role of geologic structures in the evolution of the earth’s crust (folding, faulting, flow, and fracturing of rock) and geologic hazards (earthquakes, landslides, and volcanoes). Topics: structural quantities and dimensional analysis; use of stress, strain, displacement, and velocity fields in structural analysis; the concept and measurement of deformation; mechanical properties of rock (elasticity, viscosity, stress, strength, fracture toughness); case studies of typical geologic structures using continuum mechanics. Computer labs. Prerequisites: 1, calculus, Macintosh skills. 
5 units, Aut (Pollard)

112. Mapping the Geological Environment—Introduction to modern techniques for the mapping and measurement of geological features associated with natural resources recovery, geological hazards, and environmental problems. Use of descriptive geometry and stereographic projections to analyze geological field data. Total Positioning System (TPS) and the satellite-based Global Positioning System (GPS) are used for field data acquisition. Compilation, visualization, and presentation of 2D and 3D field data is implemented using computer graphics applications and Geographic Information Systems (GIS). Field trips. (WIM) 
4 units, Spr (Einaudi, Pollard)

115. Engineering Geology Practice—(Same as Civil and Environmental Engineering 196.) The application of geologic fundamentals to the planning and design of civil engineering projects. Emphasis is on the development of geologic skills to identify, describe, and map earth materials and geologic structures as a means of determining the impact on site development. Topics: weathering and soil-forming processes, soil and rock mechanics, site investigation techniques, surface and groundwater regimes, stream and coastal processes, quaternary tectonics, deposits and geomorphology, environmental concerns, and geologic and geotechnical hazards. Field/lab exercises and case history studies emphasize the impact of site geology on the safe planning, design, and construction of civil engineering projects such as foundations, transportation facilities, excavations, tunnels and underground storage space, water supply facilities, and marine works. Prerequisite: 111 or consent of instructor. 
3 units (Holzer) alternate years, not given 2001-02

120. Geosphere—(Same as Earth Systems 110.) Geological processes, from local to global, affect people and civilization. The reverse is also true; civilization is beginning to influence the geosphere. The processes experienced at the earth’s surface (catastrophic earthquakes, volcanic eruptions, and longer term atmospheric and climate changes) are linked to what goes on in the earth’s deep interior. How geochemical, geophysical, and biological processes interact over time scales ranging from 4.5 billion years to the nearly instantaneous? Topics: the origin and evolution of the atmosphere and oceans, heat flow and global tectonics and how they have changed over time, geochemical cycles, climate change, catastrophic impacts, and the roles played by organisms. Prerequisite: 1 or 2. 
3 units, Aut (Paytan, Siebbins, McWilliams)

133. Introduction to Assessment of Environmental Risk—Interdisciplinary approach to evaluate environmental and natural hazard risks, combining economics with earth-science information. The earth sciences, applied statistics, geographic information systems (GIS) and microeconomics are integrated in a decision framework (cost-benefit analysis) to address site-specific issues (e.g., locating a waste-disposal facility), and regional issues (e.g., reducing earthquake-related damage). Techniques developed are applied in an in-class bargaining exercise to evaluate a current land-use issue. Prerequisite: 160 or equivalent, or consent of instructor. 
3 units, Win (Bernknopf)

140. Geomorphology—Focus is on the materials and surface/near-surface processes of fluvial landscapes. Topics: hillslope hydrology, weathering of rocks and soils, erosion, sediment transport, flow failures, mass wasting, and conceptual models of landscape evolution. Prerequisite: 1. Recommended: 151. (WIM) 
3 units, Win (Loague) alternate years, not given 2001-02

147. Controlling Climate Change in the 21st Century—(Enroll in Human Biology 147.) 
3 units, Aut (Schneider, Rosencranz)

151. Sedimentary Geology and Petrography: Depositional Systems—Topics: weathering, erosion and transportation, deposition, the origins of sedimentary structures and textures, sediment composition, diagenesis, sedimentary facies, tectonics and sedimentation, and the characteristics of the major siliciclastic and carbonate depositional environments. Lab: methods of analysis of sediments in hand specimen and thin section. 
Field trips required. Prerequisites: 1, 2. (WIM) 
4 units, Win (Lowe, Graham)

152. Stratigraphy and Applied Paleontology—The rudiments of interpreting sedimentary sequences. Emphasis is on the integration of paleontologic and sedimentologic evidence to reconstruct depositional environments, basin history, and paleogeographic and paleo-oceanographic settings. The nature of the fossil record, the use of fossils for dating, correlation, and paleo-environmental and paleo-oceanographic reconstructions. Characteristic variations of modern and ancient biofacies and lithofacies. Biostatigraphy, magnetostratigraphy, and radiometric dating and correlation. Term paper. Lectures supplemented by classic and current scientific literature. Weekly lab; two required field trips. Prerequisites: 1, 2. (WIM) 
4 units, Spr (Ingle)

159. Marine Chemistry—(Same as Earth Systems 159.) For upper-division undergraduates and graduate students in the earth, biology, and environmental sciences. The oceans are in interactive contact with the atmosphere, biosphere, and lithosphere, and virtually all elements pass through the ocean at some point in their cycles. The first-order processes take place within the sea, which affects its chemistry. What controls the distribution of chemical species in water and sediments? How long do different elements spend, on average, in the ocean? How do marine chemical processes interact with the biological, geological, and physical processes in the oceans? Prerequisite: 8 or the consent of the instructor. 
3 units, Spr (Paytan)

160. Introduction to Statistical Methods for Earth and Environmental Sciences—Data summaries, graphical display of data, measures of association sampling, quantification of uncertainty, statistical models, testing, and prediction. Analysis of spatial and temporal data. Examples from geologic and environmental science. 
4 units, Spr (Switzer)

163. Introduction to Isotope Geology—Introduces the use of stable and radiogenic isotopes in earth and planetary sciences; intended as a foundation for 164 and/or 165. Basic cosmochemistry and nucleosynthesis: the origin, abundance, and distribution of the elements in the solar system; factors that control elemental abundance and distribution; iso-
Stable Isotopes—Light stable isotopes and their application to geological and geophysical problems. Isotopic systematics of hydrogen, carbon, nitrogen, oxygen, and sulfur; chemical and biogenic fractionation of light isotopes in the atmosphere, hydrosphere, and in minerals. Isotopic composition of water in the oceans. Paleothermometry and paleoclimatology. Isotope fractionation in igneous, sedimentary, and metamorphic rocks, and in ore-forming fluids. Prerequisite: 163 or consent of the instructor.

3 units (Dunbar) alternate years, given 2001-02

165. Geochronology—The principles of geochronology and thermochronology and their application to geological and geophysical problems. Topics: nuclear structure, isotope systematics, decay schemes for the principal nuclides used in earth sciences, equilibrium and disequilibrium, diffusion and transport phenomena, blocking (closure) of isotopic and magnetic systems, creation and annealing of fission tracks, neutron activation, a review of geologic timescales, chronostatigraphy, magnetostratigraphy, and cosmogenic exposure ages. Alpha counting, mass spectrometry by gas source, solid source, ion probe and accelerator methods. Fundamentals of K-Ar, Ar-Ar, Rb-Sr, U-Pb fission track and cosmogenic isotope methods. Recommended: undergraduate training in calculus, chemistry, geology, and physics.

3 units (McWilliams)

166. Soil Chemistry—Practical and quantitative treatment of soil processes affecting chemical reactivity, transformation, retention, and bioavailability. The three primary areas of soil chemistry: inorganic and organic soil components, complex equilibrium in soil solutions, and adsorption phenomena at the solid-water interface. The special considerations required for acid, saline, and wetland soils.

3 units, Win (Fendorf)

170. Environmental Geochemistry—Introduction to the solid, aqueous, and gaseous phases comprising the environment, their natural compositional variations, and their chemical interactions, emphasizing the contrast between natural sources of hazardous elements and compounds and the types and sources of anthropogenic contaminants and pollutants. Identification of chemical and physical processes that result in weathering and soil formation. Chemical factors that affect the stability of solids and aqueous species under earth surface conditions. Emphasis is on processes that control the release, mobility, and fate of contaminants in natural waters and the role of water and dissolved substances play in the physical behavior of rocks and soils. The scientific basis for evaluation of the impact of contaminant and the design of remediation strategies. Case studies: mercury on the San Francisco Peninsula, heavy metals in the Sierra Nevada and Central Valley of California, and high-level radioactive waste disposal sites in the U.S. Prerequisite: 90 or consent of instructor.

4 units, Win (Brown)

171. Geochemical Thermodynamics—Introduction to the application of chemical principles and concepts to geologic systems. The chemical behavior of fluids, minerals, and gases using simple equilibrium approaches to modeling the geochemical consequences of diagenetic, hydrothermal, metamorphic, and igneous processes. Topics: reversible thermodynamics, solution chemistry, mineral-solution equilibria, reaction kinetics, and the distribution and transport of elements by geologic processes. Prerequisite: 80.

3 units, Aut (Bird)

175. Science of Soils—The physical, chemical, and biological processes that occur within soil systems. The factors governing nutrient availability, plant growth/production, land-resource management, and pollution within soils.

3 units, Aut (McWilliams)

181. Igneous and Metamorphic Processes—The origin of igneous and metamorphic rocks, emphasizing magmatic differentiation and subsolidus recrystallization processes and their imposed physio-chemical and tectonic conditions. The physical properties of magmas, role of volatile components, applications of trace elements and isotopes to igneous processes, geodynamics, and evolution of the crust-mantle system modeling of crystal fractionation and partial melting, relevant experimental data and phase diagrams, and relations of magma types to tectonic settings. Mineral paragenesis, phase relations, metamorphic reactions, fluid/rock interactions, P-T-time paths and their imposed tectonic settings. Lab hand-specimen and petrographic examinations of suites of igneous and metamorphic rocks. Graduate students may take without lab for 3 units. Prerequisites: 80, 90, or equivalents.

3 or 5 units (Liou) alternate years, given 2001-02

182. Field Seminar on Continental-Margin Volcanism—For juniors, seniors, and graduate students in the earth sciences and archeology. Three weekend-long field trips to study Cenozoic volcanism associated with subduction and with passage of the Mendocino Triple Junction off the west coast of California: Mt. Lassen/Mt. Shasta/Madoc; Clear Lake/Sonoma Volcanics; Pinnacles National Monument. Features visited and studied: andesite and basalt lavas, cinder cones, mixed magmas, blast deposit, debris avalanches, volcanic mudflows, hydrogeologic controls of springs in volcanic terrains, hydrothermal alteration and modern geothermal systems. Hg mineralization, obsidian source. Prep lectures, reading assignments, and video-viewing assignments. Light hiking and camping required. Prerequisite: 1 or equivalent.

2 units (Mahood) alternate years, given 2001-02

184. Field Seminar on Eastern Sierran Volcanism—For juniors, seniors, and graduate students in the earth sciences and archeology. Five-day trip over Memorial Day weekend to study silicic and mafic volcanism associated with the western margin of the Basin and Range province. The basaltic lavas and cinder cones erupted along normal faults bounding Owens Valley. Long Valley caldera-lake sedimentation, postcaldera rhyolite lavas, hydrothermal alteration, and hot springs. The holocene rhyolite lavas of the Inyo and Mono Craters. Volcanism of the Mono Basin with subaqueous basaltic eruptions, floating pumice blocks, and cryptodomes punching up lake sediments. If snow-level permits, silicic volcanism associated with the Bodie gold district. Prep lectures, reading assignments, and video-viewing assignments. Prerequisite: 1 or equivalent.

2 units (Mahood) alternate years, given 2001-02

185. Volcanology—For juniors, seniors, and beginning graduate students in all the earth sciences. Eruptive mechanisms; models of the emplacement of pyroclastic flows and characteristics of resulting deposits; volcanic landforms and their relation to the composition and physical properties of magmas; calderas; volcanic gases; volcanic hazards and the effects of facies models for volcanic centers eruptions on climate and the atmosphere; volcanic-hosted geothermal systems and mineral resources. One four-day field trip over Memorial Day weekend required. Prerequisite: 1 or equivalent. (WIM)

4 units, Spr (Mahood) alternate years, not given 2001-02

185L. Volcanology Laboratory—Hand sample and petrographic microscope examination of volcanic rocks. Labs keyed to 185 lectures taken concurrently. Prerequisite: some experience with a petrographic microscope.

1 unit (Mahood) alternate years, not given 2001-02
187. Introduction to Ore Deposits—The geology of hydrothermal systems, their products and processes: chemical, fluid inclusion, and isotopic characterization of fractures/veins and altered rocks, mineralogical and structural; distribution, geologic settings, and temporal evolution; and general models and interpretation of metasomatic processes. Focus is on understanding active hydrothermal systems in continental and oceanic settings and applications to ancient analogues: hot springs and mercury deposits, geothermal reservoirs and gold-silver deposits, volcanic fumaroles and magmatic-hydrothermal systems, mid-ocean-ridge hot springs and submarine massive sulfide deposits, and sedimentary basin brines and stratabound sulfide deposits. Lab: methods of study and description of veins and altered rocks; introduction to fluid inclusion microthermometry. Field trips required. Prerequisites: 80, 90.

4 units (Einaudi) alternate years, not given 2001-02

190. WIM Project—Students in a GES WIM (110, 112, 151, 152 or 185), enroll in 190 using the section # of the appropriate faculty member.

1 unit (Staff)

192. Special Projects in Geological and Environmental Sciences—Supervised reading, field, and/or lab research with written reports. 1-10 units, any quarter (Staff)

195. Integrating Remote Sensing and Geographic Information Systems (GIS)—Entry-level survey of remote sensing and GIS; weekly computer-based lab session involving both subjects, stressing the interrelationships of the information from remotely sensed environmental data with the techniques and methodology of GIS. Lab enrollment limited to 20.

3 units, Aut (Staff)

196. Introduction to GIS: ARC/Info and Arc-View—(Graduate students enroll in 296; same as Geophysics 196.) Hands-on experience with ESRI's ARC/INFO or Arc-View commercial GIS packages. Topics: setting up geographic databases and manipulating spatial data, including database query and analysis. Hands-on computer-based exercises using sample ARC datasets on workstations. Guest lectures on GIS applications in the environmental, geological, and biological sciences, and in town planning. Students unable to register for 196 may sign up, with consent of instructor, for a self-paced computer tutorial version in 197, any quarter.

2 units, Win (Klemperer)

197. Research in the Application of Geographic Information Systems (GIS)—Supervised reading, field, and/or lab research with written reports. 1-5 units, Aut, Win, Spr (Klemperer)

198. Special Problems in Geological and Environmental Sciences—Supervised reading, field, and/or lab research with written reports. 1-10 units, any quarter (Staff)

199. Honors Program—Research on a topic of special interest. See "Undergraduate Honors Program" above.

3 units, Aut, Win, Spr, Sun (Staff)

GRADUATE

200. Issues in Geoscience Education

1 unit, Aut, Win, Spr (Staff)

202. Reservoir Geomechanics—(Enroll in Geophysics 202.)

3 units, Win (Zoback)

205. Advanced Oceanography—For upper-division undergraduates and graduate students. Topics vary each year following or anticipating research trends in oceanographic research. Focus is on links between the circulation and physics of the ocean with climate in the North Pacific region, and marine ecologic responses. Lectures/discussion, with participation by marine scientists from various marine research groups and organizations including the Monterey Bay Aquarium Research Institute.

3 units (Dunbar) alternate years, given 2001-02

206. Antarctic Marine Geology—For upper-division undergraduates and graduate students. Intermediate and advanced topics in marine geology and geophysics, focusing on examples from the Antarctic continental margin and adjacent Southern Ocean. Topics: glaciers, icebergs, and sea ice as geologic agents (glacial and glacial marine sediments, modern particulate sediments, Antarctic biomineralization and chronostatigraphy (continental margin evolution). Students interpret seismic lines and sediment core/well log data. Examples from a recent scientific drilling expedition to Prydz Bay, Antarctica. Up to two students may have an opportunity to study at sea in Antarctica during Winter Quarter.

3 units, Aut (Dunbar, Cooper)

210. Geologic Evolution of the Western U.S. Cordillera—For undergraduates and graduates. Overview of the geology of the western states. The evolution of the mountain belt from its inception in the Precambrian to its contemporary history of extension and strike-slip faulting, based on the description, analysis, and interpretation of the rock record through time. The characteristic structural styles developed during crustal shortening, extension, and strike-slip tectonic regimes; tectonic controls on sedimentary basin formation; plate margin magmatism and metamorphism; and the relation of plate motions to the land geologic record provide insight into the crustal-scale processes and driving mechanisms common to mountain chains.

2-3 units (Miller) alternate years, given 2001-02

211. Topics in Regional Geology and Tectonics—Seminar.

2 units, Win (Miller)

215. Advanced Structural Geology and Rock Mechanics—(Same as Geophysics 215.) The observational techniques, analysis methods, and theoretical foundations of structural geology, engineering geology, and rock mechanics. Computer exercises are integrated with field data to understand the role of geologic structures in the evolution of the earth's crust (folding, faulting, flow, and fracturing of rock) and geologic hazards (earthquakes and volcanoes). Topics: structural quantities and dimensional analysis; use of stress, strain, displacement, and velocity fields in structural analysis; concept and measurement of deformation; mechanical properties of rock (elasticity, viscosity, strength, friction, fracture toughness); case studies of typical geologic structures using continuum mechanics. Computer labs.

5 units, Aut (Pollard)

216. Rock Fracture Mechanics—(Same as Geophysics 216.) Theoretical and experimental principles of continuum and fracture mechanics are applied to the origin and physical behavior of faults, dikes, joints, veins, solution surfaces, and other natural structures in rock. Field observations, engineering rock fracture mechanics, and the elastic theory of cracks. The role of natural fractures in brittle rock deformation, fluid flow, and heat transport in the earth's crust with applications to crustal deformation and tectonophysics, structural geology, petroleum geology and engineering, and hydrogeology. Prerequisite: 215 or equivalent.

5 units (Pollard) alternate years, given 2001-02

217. Characterization and Hydraulics of Rock Fractures—Interdisciplinary survey of natural fractures (faults, joints, veins, and solution seams) and their geological, geophysical, geomechanical, stochastic, and hydraulic properties. Case studies of fracture characterization experiments and problems related to fluid flow in aquifers, oil and gas reservoirs, and waste repository sites in fractured rock. Invited lecturers from various disciplines and one weekend field trip. Prerequisite: equivalent of first-year graduate student in Geological and Environmental Sciences, Geophysics, or Petroleum Engineering.

3 units (Aydin) alternate years, given 2001-02
219. Paleooceanography—For upper-division undergraduates and graduate students in the earth, biology, and environmental sciences. How can we learn about the chemistry, circulation, biology, and geology of past oceans and why is this of interest? Evidence for substantial changes in earth's climate and surficial environment is contained in the sedimentary record. The fundamentals of gathering and interpreting this information in the context of understanding how earth processes functioned in the past and their relevance for the habitability of our planet in the future.

3 units, Aut (Paytan)

220. Terrestrial Biogeochemistry—For upper-division undergraduates and graduate students in the earth and biological sciences. The processes by which components of terrestrial ecosystems interact, drawing on areas of geology, soil science, hydrology, chemistry, biology, and ecology, and emphasizing nutrient cycling.

3 units (Matson, Vitousek) alternate years, given 2001-02

221. The Origins of Life in the Solar System—Interdisciplinary seminar for upper-division undergraduates and graduate students in the physical and biological sciences. Current topics in exobiology and the origins of life from a planetary sciences perspective. Definitions of life and the origin of information; water, carbon, and energy; phylogenetic and fossil inferences about early life on Earth; the early terrestrial environment, including asteroid and comet impacts; prebiotic organic syntheses and the RNA world; panspermia; the search for life on Mars; Europa, including prospects for an ocean and speculative ecologies; upcoming spacecraft missions and mission planning; planetary protection, back contamination, and legal and ethical issues; and student-suggested topics. Student presentations, group discussion, and lectures.

3 units, Spr (Chyba)

222. Seminar in Sustainable Agriculture—(Same as Earth Systems 222.) For upper-division undergraduates and graduate students in the earth and biological sciences.

2-3 units (Matson, Naylor) alternate years, given 2001-02

223. Isotopes in Geological and Environmental Research—For upper-division undergraduates and graduate students in the earth, biology, and environmental sciences. The applications of different isotopic systems in geological, oceanographic and environmental studies at low temperature. The use of isotopes as tracers for weathering rate, biogeochemical cycling, food-web structures, ecology, paleo-chemistry, provenance, circulation, anthropogenic and extraterrestrial inputs, etc. Isotopic systems: S, Sr, Nd, Ra, Os, B, Th, Pb, Ca, Se, Si, He, Be, and Fe. Emphasis is on developing skills in reading and evaluation of scientific papers, preparing oral presentations, conducting literature searches, manuscript reviews, and proposal preparation. Prerequisite: 163, 164, or consent of the instructor.

3 units (Paytan) alternate years, given 2001-02

230. Physical Hydrogeology—(Same as Civil and Environmental Engineering 260A.) Theory of underground water, analysis of field data and pumping tests, geologic groundwater environments, solution of field problems, groundwater modeling. Introduction to groundwater contaminant transport and unsaturated flow. Lab. Prerequisite: elementary calculus.

5 units, Aut (Gorelick)

4 units, Spr (Gorelick)

235. Role of Fluids in Geologic Processes—The principles governing groundwater flow and its interaction with crustal stress, heat flow, and chemical mass transport. Topography-driven flow of groundwater on a regional scale; compaction-driven flow in the sedimentary basin; development of anomalous fluid pressure; the role of fluid in tectonism; migration and entrainment of petroleum; density driven flow and thermal anomaly; formation of mineral deposits. Prerequisite: 230.

3 units, Spr (Hsieh) alternate years, not given 2001-02

4 units (Loague) alternate years, given 2001-02

4 units (Loague) alternate years, given 2001-02

238. Soil Physics—Advanced level, focusing on the physical and chemical properties of the soil solid phase, with emphasis on the transport, retention, and transformation of water, heat, gases, and solutes in the unsaturated subsurface. Agricultural systems. Field techniques and classic experiments demonstrated and reproduced in the lab. Prerequisite: elementary calculus.

4 units, Aut (Loague) alternate years, not given 2001-02

3 units (Loague) alternate years, given 2001-02

240. Geostatistics for Spatial Phenomena—(Same as Petroleum Engineering 240.) Probabilistic modeling of spatial and/or time dependent phenomena. Kriging and cokriging for gridding and spatial interpolation. Integration of heterogeneous sources of information. Stochastic imaging of reservoir/field heterogeneities. Introduction to GSLIB software. Case studies from the oil and mining industry and environmental sciences. Prerequisites: introductory calculus and linear algebra, Statistics 116 or equivalent.

3-4 units, Win (Caers)

241. Practice of Geostatistics and Seismic Data Integration—(Same as Petroleum Engineering 241.) Students build a synthetic 3D fluvial channel reservoir model with layer depths, channel geometry, and facies-specific petrophysical and seismic properties, stressing the physical significance of geophysical data. Reference data set is sparsely sampled providing the sample data typically available for an actual reservoir assessment. Geostatistical reservoir modeling uses well and seismic data, with results checked against the reference data base. All software provided (GSLIB and SROTools). Recommended: basic prior experience with Unix, Matlab/Fortran programming. Prerequisite: 240.

3-4 units, Spr (Caers, Mukerji)

242A. Topics in Advanced Geostatistics—(Same as Petroleum Engineering 242.) Conditional expectation theory and projections in Hilbert spaces; parametric vs. non-parametric geostatistics; Boolean, Gaussian,
fractal, indicator, annealing approaches to stochastic imaging; multiple
point statistics inference and reproduction; neural net geostatistics;
Bayesian methods for data integration; techniques for upscaling hydro-
dynamic properties. May be repeated for credit. Prerequisites: 240,
advanced calculus, Fortran/Unix.

246. Reservoir Characterization and Flow Modeling with Outcrop Data—(Same as Petroleum Engineering 246.) Project provides earth
science students with an understanding of how to use outcrop observa-
tions in quantitative geological modeling and flow simulation, and
addresses a specific reservoir management problem by studying a
suitable outcrop analogue (weekend field trip), constructing geostatisti-
cal reservoir models, and performing flow simulation. An introduction,
through an applied example, to the relationship between the different
disciplines. A different reservoir management question and outcrop
analogue is studied each year.

3 units, Aut (Journel) alternate years, not given 2001-02

249. Biological Markers—The basic atomic building block for life as
we know it is carbon. Biological markers (molecular fossils, biomarkers)
are known from the Archean to the Present as biologically derived carbon
compounds that provide information on the paleoenvironment, geologic
age and stratigraphy, thermal maturity, and diageneis of sediments,
rocks, and petroleum. Biomarker “fingerprints” are useful to monitor and
determine the environmental fate of petroleum and to understand and
map petroleum systems. They are key biogeochemical proxies for
monitoring, discovering, and explaining paleoenvironmental conditions
and changes. Recently, they have been a focus in the search for extrater-
restrial life. The fundamentals to understanding, interpreting, and apply-
ing biomarkers and their “fingerprints.”

2-3 units, Aut (Moldowan)

250. Sedimentation Mechanics—The mechanics of sediment transport
and deposition and the origins of sedimentary structures and textures as
applied to interpreting ancient rock sequences. Dimensional analysis,
fluid flow, drag, boundary layers, open channel flow, particle settling,
erosion, sediment transport, sediment gravity flows, soft sediment defor-
mation, and fluid escape. Field trip required.

3 units (Lowe) alternate years, given 2001-02

251. Sedimentary Basins—Analysis of the depositional framework and
tectonic evolution of sedimentary basins. Topics: tectonic and environ-
mental controls on facies relations, synthesis of basin development
through time in terms of depositional systems and tectonic settings.
Weekend field trip required. Prerequisites: 110, 151.

3 units (Graham) alternate years, given 2001-02

252. Sedimentary Petrography—Examination/interpretation of silici-
clastic sediments and sedimentary rocks. Lectures/readings stress re-
search in modern sedimentary mineralogy and petrography and the
relationship between the composition and texture of sediments and their
provenance, tectonic settings, and diageneric histories. Class is topical
and varies yearly. Prerequisite: 151 or equivalent.

4 units (Lowe) alternate years, not given 2001-02

253. Petroleum Geology and Exploration—The basics of petroleum
geology. The origin, occurrence, and exploration for hydrocarbons.
Topics: thermal maturation history in hydrocarbon generation, signifi-
cance of sedimentary and tectonic structural setting, principles of accum-
ulation, geological and geophysical exploration techniques. Prerequi-
sites: 110, 151. Recommended: Geophysics 183.

3 units (Graham) alternate years, given 2001-02

254. Advanced Paleoenography—Paleochemistry and paleocircula-
tion of the oceans as deduced from the study of marine sediments.

3 units (Dunbar) alternate years, given 2001-02

255. Introduction to Micropaleontology—Microscopic marine foss-
sils, including diatoms, ostracods, and radiolarians, with emphasis on
foraminifera. The principles of classification, evolutionary trends, com-
mon genera, ecology, and environmental distribution of foraminifera.
Application of planktonic and benthic foraminifera to interpretation of
paleoenvironments, paleoceanographic and paleoclimatic analysis, and
correlation of marine sequences. Paleoenvironmental and age analysis of
an unknown microfossil sample serves as a term research project. Lab on
microfossil groups.

5 units (Ingles) alternate years, given 2001-02

256. Advanced Micropaleontology—The use of marine microfossils
(mainly benthic and planktonic foraminifera) to solve fundamental
geologic and oceanographic problems. Applications to geochronology,
correlation, paleoecology, and paleoceanography. Individual analysis of
a series of unknown samples provides intensive experience in applying
basic concepts of biostratigraphy and paleoenvironmental analysis to
interpretation of Paleozoic, Mesozoic, and Cenozoic microfossil assem-
bles. Lectures on classic and current examples of research in this field.
Prerequisite: 255.

3 units (Ingles) alternate years, given 2001-02

257. Climate Variability and Forcing Mechanisms of the Last 10,000
Years: Implications for Life in the 21st Century—Open to graduate
students and seniors in the earth sciences, earth systems, ecology, and
anthropology. Overview of large-scale features of the climate systems
that control interannual variability in temperature and rainfall. Recent
studies in climate reconstruction and the influence of climate change on
man. Lectures/readings and discussions.

3 units (Dunbar) alternate years, given 2001-02

258. Introduction to Depositional Systems—The characteristics of the
major sedimentary environments and their deposits in the geologic
record, including alluvial fans, braided and meandering rivers, aeolian
systems, deltas, open coasts, barred coasts, marine shelves, and deep-
water systems. Emphasis is on subdivisions; morphology; the dynamics
of modern systems; and the architectural organization and sedimentary
structures, textures, and biological components of ancient deposits.

3 units (Lowe) given 2001-02

260. Laboratory Methods in Organic Geochemistry—Organic mate-
rials in the Earth and its surface environments generally occur as complex
mixtures. Detailed knowledge of specific components in geochemical
mixtures is useful to understand geological and environmental samples.
The presence and relative abundance of these compounds provides
information on the biological source, depositional environment, burial
history, biodegradation, and toxicity of organic materials. Laboratory
methods detect and quantify various components of these mixtures. The
lab provides a basic understanding and hands-on experience of methods
used for the separation and detailed analysis of organic compounds in
geologic samples: extraction, liquid chromatography, absorption by
zeolites, gas chromatography and gas chromatography-mass spectrom-
etry. Student samples are considered as material for analysis. Recom-
mended: 249.

2-3 units, Win, Spr (Moldowan)

261. Physics and Chemistry of Minerals and Mineral Surfaces—The
interaction of x-rays with solids and liquids (scattering and spectros-
cyopy); crystal chemistry and bonding in solids and their relative stability;
the interaction of x-rays with solids and liquids (scattering and spectros-
cyopy); structural variations in silicate glasses and liquids; UV-visible
spectroscopy and the color of minerals; review of the mineralogy, crystal
chemistry, and structures of selected rock-forming silicates and oxides;
mineral surface and interface geochemistry.

4 units (Brown) alternate years, given 2001-02

262. Thermodynamics and Disorder in Minerals and Melts—The
thermodynamic properties of crystalline, glassy, and molten silicates and
oxides in light of microscopic information about short range structure and ordering. Measurements of bulk properties, e.g., enthalpy, density, and their pressure and temperature derivatives, and structural determination by spectroscopies such as Nuclear Magnetic Resonance and Mössbauer. Basic formulations for configurational entropy, heats of mixing in solid solutions, activities; and the energetics of exsolution, phase transitions, and nucleation. Quantitative models of silicate melt thermodynamics are related to atomic-scale views of structure. A general view of geothermometry and geobarometry. Prerequisites: introductory mineralogy and thermodynamics.

3 units (Stebbins) alternate years, not given 2001-02

264. Low Temperature Aqueous Geochemistry—(Same as Civil and Environmental Engineering 273.) Chemical principles and their application to the analysis and solution of problems in aqueous geochemistry (temperatures near 25°C and atmospheric pressure). Emphasis is on the analysis of natural water systems and the understanding and solution of specific chemical problems in water purification technology and water pollution control. Prerequisites: Chemistry 31 and 33, or equivalents.

3 units, Aut (Leckie)

265. Soil Chemical Dynamics—Chemical and biologically mediated chemical processes within soils and surface waters; emphasis is on oxidation-reduction reactions and processes at the solid-water interface. Topics: electron transfer processes, dissimilatory metal reduction, ion exchange, electrified interfaces, specific adsorption, and dissolution/precipitation.

3 units, Win (Fenderson)

3 units (Bird) alternate years, not given 2001-02

270. Petrologic Phase Equilibria—The principles of phase equilibrium determined by lab experimentation and thermochemical calculation, as applied to igneous and metamorphic petrology. Focus is on the underlying principles of classical thermodynamics which govern mineral equilibria. Introduction to phase relations, element partitioning, chemical kinetics, and order-disorder phenomena in geologic systems.

4 units (Ernst) alternate years, given 2001-02

275. Electron Microanalytical Techniques—The practical and theoretical aspects of x-ray generation and detection, and the behavior of electron beams and x-rays in solids. The basic principles needed to quantitatively analyze chemically complex geological materials. Operation of the JEOL 733 electron microprobe and associated computer software for quantitatively analyzing materials. X-ray chemical mapping. Enrollment limited to 8.

3 units, Win (Jones)

285. Petrogenesis of Crustal Magmatism—Radiogenic isotopes (Rb-Sr, Sm-Nd, Re-Os, U-Pb, and U-series disequilibrium systems), stable isotopes, and trace elements applied to igneous processes; evidence for the nature of basalt sources; interaction of magmas with mantle and crust; convergent-margin magmatism; magmatism in extensional terrains; origins of rhyolites; residence times of magmas and magma chamber processes; granites as imperfect mirrors of their source regions; trace-element modeling of igneous processes; trace-element discriminant diagrams in tectonic analysis; sources of ore forming metals. Topics emphasize the interests of students. Prerequisite: 181, or its equivalent.

3 units, Win (Mahood) alternate years, not given 2001-02

290. Numerical Analysis of Geological Time Series—Seminar for graduate students interested in a variety of statistical tools appropriate for analysis of time series. Topics: fourier transform techniques, singular spectrum analysis, evolutionary spectral analysis, and filtering. Prerequisites: some knowledge of UNIX.

3 units (Dunbar) alternate years, not given 2001-02

295. Integrating Remote Sensing and Geographic Information Systems (GIS)—For graduate students; see 195.

296. Introduction to GIS: ARC/INFO and ARC-View—(Same as Geophysics 296.) For graduate students; see 196.

297. Research in the Application of Geographic Information Systems (GIS)—For graduate students; see 197.

314A,P. Research Seminar: Structural Geology and Geomechanics—Selected topics. May be repeated for credit.

1 unit, Aut, Win, Spr (Pollard, Aydin)

322A,B,C. Seminar in Biogeochernistry—Presentations and discussion of current topics in biogeochernistry. May be repeated for credit.

1-2 units, Aut, Win, Spr (Matson)

1-2 units, Aut, Win, (Loague)

330.A,B,C. Advanced Topics in Hydrogeology—Critical discussion of modern topics in groundwater hydrology. Topics: questioning classic explanations of physical processes; consideration of coupled physical, chemical, and biological processes effecting heat and solute transport.

1-2 units, Aut, Win, Spr (Gorelick)

332A,B. Seminar in Hydrogeology

1 unit, Aut (Gorelick)

Win (Loague)

333. CESIR Seminar—The Center for Earth Science Information Research seminars are a multi-disciplinary lecture series. Emphasis is on the utilization of science for policy analysis and decision making. Speakers are from the physical and social sciences.

1-2 units, Spr (Bernknopf)

335. Special Topics in Earth Sciences Seminar—Presentation and discussion of current topics in the earth sciences. Suggested topics: gas hydrates, paleoproductivity, the glacial world, mass extinctions, the K/T boundary, hydrothermal vents, paleocirculation, warm climates in Earth's history, geomicrobiology, evaporite deposits. Each year a different topic is given with lectures by guest speakers.

1-2 units, Aut, Win, Spr (Paytan) alternate years, given 2001-02

342A,B,C. Seminar: Geostatistics—Discussion of classic results and current research in geostatistics. Topics selected on basis of interest and timeliness. May be repeated for credit.

1-2 units, Aut, Win, Spr (Journel)

350. Seminar in Sedimentary Geology

1-3 units, Win, Spr (Staff)

360. Topics in Low Temperature Surface and Aqueous Geochemistry—Guided independent study, analysis, and critical oral and written reports on selected topics in environmental, surface, and/or aqueous geochemistry under earth-surface conditions. Prerequisites: 80 and 264; consent of instructor.

2-4 units, one quarter annually (Brown, Parks)
Geophysics

Emeritus: George A. Thompson (on active duty)
Chair: Jerry M. Harris

Professors: Jon F. Claerbout, Steven Gorelick, Jerry M. Harris, Rosemary I. Knight, Robert L. Kovach, Marcia McNutt†, Amos M. Nur, Joan Roughgarden*, Paul Segall, Norman H. Sleep, Mark D. Zoback

Associate Professors: Gregory C. Beroza, Simon L. Klemperer, Howard Zeckert**
Assistant Professor: Kevin Arrigo
Professors (Research): Antony Fraser-Smith**, Gerald M. Mavko
Associate Professor (Research): Biondo Biondi

Geophysics is the branch of earth science concerned with exploring and analyzing active processes of the earth through physical measurement. The undergraduate and graduate programs are designed to provide (1) a background of fundamentals in science, and (2) courses to coordinate these fundamentals with the principles of geophysics. The program leading to the Bachelor of Science (B.S.) in Geophysics permits many electives and a high degree of flexibility for each individual student. Graduate programs provide specialized training for professional work in resource exploration, research, and education and lead to the degrees of Master of Science and Doctor of Philosophy.

The Department of Geophysics is housed in the Ruth Watts Mitchell Earth Sciences Building. It has numerous research facilities, among which are a state-of-the-art broadband seismic recording station, high pressure and temperature rock properties and rock deformation laboratories, computers, various instruments for field measurements including seismic recorders, nine dual frequency GPS receivers, and field equipment for measuring in-situ stress at great depth. Current research activities include biogeochemical cycling; crustal deformation; earthquake archaeology; earthquake seismology and earthquake mechanics; reflection, refraction, and tomographic seismology; rock mechanics, rock physics; seismic studies of the continental remote sensing; lithosphere, and environmental geophysics; and synthetic aperture radar studies.

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

Objectives — To provide a solid background in the essentials of math, physics, and geology, while at the same time providing knowledge about the entire spectrum of geophysics ranging from exploration geophysics to earthquake seismology and plate tectonics. Students are prepared for either an immediate professional career in the resources and environmental sciences industries or future graduate study.

The following courses are required for the B.S. degree in Geophysics, in addition to the University requirements in general studies. A written report on original research or an honors thesis is also required. Normally, this is undertaken as part of the student's participation in three quarters of Research Seminar (the Geophysics 185 series) during the senior year. Seniors in Geophysics who expect to do graduate work are urged to take the Graduate Record Examination as early as is convenient in their final undergraduate year.

CURRICULUM

Course No. and Subject

Chem. 31. Chemical Principles
Elect. Engr. 141 or Physics 120. Electromagnetic Fundamentals
Geol. & Envir. Sci. 1. Fundamentals of Geology
Geoph. 185. Research Seminars
Math. 19, 20, 21 or 41, 42, or 51, 52
Math. 130. Ordinary Differential Equations
Physics 41. Mechanics
4. Submit a Program Proposal for the Master's Degree in the first quarter.

5. Each student must present and defend the results of his or her research at a public oral presentation attended by at least two faculty members. Students who do not meet the standard course requirements (see the undergraduate curriculum), but who have unusual competence in other areas such as earth systems, science, or space physics may petition the Geophysics faculty to arrange individual programs.

M.S. IN EXPLORATION AND DEVELOPMENT

Objectives—To provide the theoretical and practical background needed for a career in petroleum exploration and development geophysics. The program takes a minimum of four quarters (beginning and ending in the Autumn Quarter), but more typically six quarters. A summer internship working in industry, or a research or experimental laboratory, is an integral part of the program. A written report based on the summer internship is publicly presented and defended. Some MSED students also accomplish independent research during their degree program through their participation in one or multiple quarters of Research Seminar (the Geophysics 385 series).

Prerequisites—B.S. degree in engineering, geology, geophysics, mathematics, or physics; a sequence of courses in mathematics at least through ordinary differential equations; and at least one course in introductory geology. The following additional undergraduate courses are recommended: computer science, complex variables, linear algebra, petrology, and structural geology.

Requirements for the Degree—Geophysics 111, 112, 120, 150, 174, 182, 183, 190, 210, 262, 380A, 380B; Geological and Environmental Sciences 110 or 111, 240, 247 or 248, 251, 253; Petroleum Engineering 120, 130; Electrical Engineering 104 or 261; and elective courses in earth sciences, mathematics, physics, and engineering. If appropriate, requirements may be waived and additional electives substituted with consent of the candidate’s faculty adviser and of the Geophysics faculty Graduate Coordinator. Recommended electives include Geophysics 160, 170, 180, 202, 230, 285, 397; Geological and Environmental Sciences 151, 249; and Mechanical Engineering 200A. At least 45 units with a grade point average (GPA) of at least 'B' are required for the completion of this degree.

DOCTOR OF PHILOSOPHY

Objectives—The Ph.D. degree is conferred upon evidence of high attainment in Geophysics, and ability to conduct an independent investigation and present the results of such research.

Requirements for the Degree—A minimum of three years and the completion of 108 units of graduate study at Stanford must be satisfactorily completed. During their first two years, candidates must complete a core sequence of classes: Geophysics 111, 112, 120, 150, 160; Mechanical Engineering 200A, 238A; Electrical Engineering 261 or Mechanical Engineering 308, and one data analysis course such as Geophysics 180 or 211, Petroleum Engineering 284, Civil and Environmental Engineering 267, Geological and Environmental Sciences 160 or 240, Statistics 110, or equivalent. Candidates must also participate in Research Seminars (the Geophysics 385 series) from their first quarter.

During the course of their studies, Ph.D. candidates are additionally required to complete Geophysics 170, 190; Engineering 102W; Physics 210 or Mathematics 220A or Mechanical Engineering 200B. Students are also encouraged to complete Physics 211 or Mathematics 220B or Mechanical Engineering 200C. Candidates are required to complete lecture classes outside the core sequence from at least two different Geophysics faculty members; and at least two non-Geophysics lecture classes in Earth Sciences (that is, the Department of Geological and Environmental Sciences and/or the Department of Petroleum Engineering). A minimum equivalent knowledge at the level of Geological and Environmental Sciences 1 is required. Highly recommended non-Geophysics Earth Science courses are Geological and Environmental Sciences 111, 120, 140, 231, and 251; and Petroleum Engineering 120, 130, 221, 224, and 240. Additional advanced courses should be selected from other science and engineering departments. A typical sequence for entering graduate students in their first year is: Autumn—Geophysics 111, 112, 120, 130, and Mechanical Engineering 200A or 238A; Winter—Geophysics 160, 385, and one elective; Spring—Geophysics 180, 385, and Electrical Engineering 261 or other elective. All students prepare a proposed study list for each year by the end of the first quarter of that year.
If appropriate, any class requirement may be waived, or electives substituted, with written consent of both the candidate's faculty adviser and the Geophysics Graduate Coordinator.

The candidate's record must indicate outstanding scholarship, and deficiencies in previous training must be removed. Experience as a teaching assistant (quarter-time for at least two academic quarters) is required for the Ph.D. degree. The student must pass the departmental oral examination by presenting and defending a written research paper or proposal by the end of the second year; prepare under faculty supervision a dissertation that is a contribution to knowledge and the result of independent work expressed in satisfactory form; and pass the University oral examination, which is essentially a defense of the dissertation. The Ph.D. dissertation must be submitted in its final form within five calendar years from the date of admission to candidacy. The Geophysics faculty monitors student progress by carrying out an annual performance appraisal (at a closed faculty meeting) of all students who have not yet passed their departmental oral examination. Following successful completion of the departmental oral examination, candidates are required to organize an annual meeting of their research committee to review their progress towards the Ph.D. degree.

COURSES

4. Natural Hazards and Human Survival—For non-majors and potential earth scientists. Introduction to understanding natural and other hazards, earthquakes, volcanic eruptions, tsunamis, toxic waste disposal, nuclear power plant siting, their risk assessment, possible mitigation, and protective measures. GER:2a (DR:5)
   3 units, Aut (Beroza, Segall)
   Win (Kovach)

5Q. Stanford Introductory Dialogue: Earthquakes of the Americas—Preference to sophomores. Earthquakes have had an impact on the development of cultures and societies. The early empires of the Maya and the Aztecs undoubtedly experienced earthquakes and volcanic eruptions and we rely on archaeological remains and glyphs from codices to ascertain past occurrences. Evidence from several Mexican and Central American archaeological sites uncovers the societal consequences and possible role of these natural events in the abandonment, migration, and settlement of cultural centers.
   2 units, Aut (Kovach)

30Q. Stanford Introductory Dialogue: The 1906 San Francisco Earthquake—Preference to sophomores. Earthquakes have had an impact on the development of cultures and societies. The early empires of the Maya and the Aztecs undoubtedly experienced earthquakes and volcanic eruptions and we rely on archaeological remains and glyphs from codices to ascertain past occurrences. Evidence from several Mexican and Central American archaeological sites uncovers the societal consequences and possible role of these natural events in the abandonment, migration, and settlement of cultural centers.
   2 units, Spr (Beroza)

   3 units, Spr (Zebker)

50Q. Stanford Introductory Dialogue: Earthquakes and Archaeology in the Eastern Mediterranean—Lectures and Field Trip—Preference to sophomores. Why are there so many archaeological ruins in the eastern Mediterranean? Assumed by many to be the result of time and wars, many of these ruins are due to historic and prehistoric earthquakes. Modern science reveals that some of these earthquakes must have been so destructive, or happened at times of such political and military stress, that they changed history (e.g., the fall of Jericho before Joshua, the catastrophic collapse at the end of the Bronze Age). Lectures
graphic features. Prerequisites: Geophysics 130, Earth Systems 130, or Hopkins Marine 163H/263H.

142. Principles of Ecology.—(Same as Biological Sciences 142.) Introduction to ecology, emphasizing ecological theory and the population and community scales of organization, using primarily zoological examples. Evolutionary processes in ecology. Prerequisites: first-year calculus (Mathematics 19-21 or higher). Recommended: Biological Sciences 43 or 51.

4 units (Arrigo) alternate years, given 2001-02

3 units, Aut (Sleep, Klemperer)

3 units, Win (Harris, Claerbout, Beroza)

170. Fluids in the Earth's Crust.—Interdisciplinary problems involving the state and movement of fluids in the earth's crust: basics of the coupling in porous rocks between chemical transport, fluid flow, deformation and stress, and waves; applications to gas hydrates under the oceans; reservoir geophysics; geophysical recovery monitoring; aquifer geophysics; pore pressure in faulting and aftershocks and in the earth's crust; permeability from seismic; viscoelastic rebound; pore fluids and subduction; sediment transport to seismic reflection; pressure solution and stylolites. Prerequisite: consent of instructors.

3 units, Win (Nur, Dvorkin)

180. Geophysical Inverse Problems.—Fundamental concepts of inverse theory, with application to geophysics. Inverses with discrete and continuous models, generalized matrix inverses, resolving kernels, regularization, use of prior information, singular value decomposition, nonlinear inverse problems, back-projection techniques, and linear programming. Application to seismic tomography, earthquake location, migration, and fault-slip estimation. Prerequisite: Mathematics 103.

3 units, Spr (Beroza, Segall)

182. Reflection Seismology.—The principles of seismic reflection profiling, focusing on methods of seismic data acquisition and seismic data processing for hydrocarbon exploration.

3 units (Klemperer) alternate years, not given 2001-02

183. Interpretation of Seismic Reflection Profiles.—Lectures and workshops on the structural and stratigraphic interpretation of seismic reflection data, emphasizing hydrocarbon traps in two and three dimensions on industry data, including workstation-based interpretation. Lectures only; 1 unit. Prerequisite: 182, or consent of instructor.

1-4 units, Spr (Klemperer, Graham) alternate years, not given 2001-02

184. Seismic Data Processing.—Workshop experience in computer processing of seismic reflection data. Students individually process a commercial seismic reflection profile from field tapes to migrated stack, using interactive software on a workstation. Prerequisite: consent of instructor.

3 units (Klemperer) alternate years, not given 2001-02
197. Research in the Application of Geographic Information Systems (GIS)—(Enroll in Geological and Environmental Sciences 197.) 1-5 units, Aut, Win, Spr (Klemperer)

202. Reservoir Geomechanics—Basic principles of rock mechanics and the state of stress and pore pressure in sedimentary basins related to exploitation of hydrocarbon and geothermal reservoirs. Mechanisms of hydrocarbon migration, exploitation of fractured reservoirs, reservoir compaction and subsidence, hydraulic fracturing, utilization of directional and horizontal drilling to optimize borehole stability, minimization of sand production. 3 units, Win (Zoback)

205. Honors Program—Experimental, observational, or theoretical honors project and thesis in geophysics under supervision of a faculty member. Students who elect to do an honors thesis should begin planning it no later than Winter Quarter of the junior year. Prerequisites: superior work in the earth sciences and approval of the department. 1-3 units, Aut, Win, Spr, Sum (Staff)

211. Environmental Soundings Image Enhancement—Basic ideas of geophysical data mapping and imaging as exemplified by a variety of elementary examples: interpolate, extrapolate, regrid, depth sounding, sea-beam bathymetry, satellite altimetry, imaging, seismic velocity, and reflectivity. Adjoints, back projection, and images. Applied inverse theory using least-squares conjugate gradients. Weights and filters in data space and model space. Decompose data into signal and noise. See http://sepwww/sep/prof. 3 units, Win (Claerbout)

215. Advanced Structural Geology and Rock Mechanics—(Same as Geological and Environmental Sciences 215.) 3 units, Aut (Pollard)

216. Rock Fracture Mechanics—(Same as Geological and Environmental Sciences 216.) 5 units (Pollard) alternate years, given 2001-02

230. Advanced Topics in Well Logging—(Same as Petroleum Engineering 230.) Designed to follow a course in standard well logging, and assumes knowledge of standard practice and application of electric well logs. Guest lectures on state-of-the-art tools and analyses; and the technology, rock physical basis, and applications of each measurement. Hands-on computer-based analyses illustrate instructional material. Prerequisite: Petroleum Engineering 130 or equivalent. 3 units, Spr (Lindblom)

240. Borehole Seismology—The study and application of seismic-acoustic waves in and around boreholes for application to sonic well logging, crosswell seismic profiling, and vertical seismic profiling. Topics: forward modeling, seismogram interpretation, data processing, imaging, and inversion. Applications from reservoir and site characterization studies and reservoir monitoring. Prerequisite: consent of instructor. 3 units (Harris) alternate years, given 2001-02

241. Practice of Geostatistics and Seismic Data Integration—(Same as Petroleum Engineering 241.) Students build a synthetic 3D fluvial channel reservoir model with layer depths, channel geometry, and facies-specific petrophysic and seismic properties, stressing the physical significance of geophysical data. Reference data set is sparsely sampled, providing the sample data typically available for an actual reservoir assessment. Geostatistical reservoir modeling uses well and seismic data, with results checked against the reference database. All software provided (Gslib and SRF tools). Recommended: basic prior experience with Unix, Matlab/Fortran programming. Prerequisite: 240. 3-4 units, Spr (Caers, Mukerji)

242. Principles of Ecology—(Enroll in Biological Sciences 242.) 4 units, Aut (Roughgarden)

255. Report on Energy Industry Training—Provides on-the-job training for master’s and doctoral degree students under the guidance of experienced, on-site supervisors. Students must submit a concise report detailing work activities, problems, assignments, and key results. Prerequisite: written consent of adviser. 1-3 units, any quarter (Staff)

262. Rock Physics—Properties of rocks in relation to geophysical exploration, crustal studies, and tectonic processes. Emphasis is on wave velocities and attenuation, hydraulic permeability, and electrical resistivity in rocks. Application to in situ problems, using lab data and theoretical results. 3 units, Spr (Mavko)

280. 3-D Reflection Seismology—The principles of imaging complex structures in the Earth subsurface using 3-D reflection seismology. Emphasis is on processing methodologies and algorithms, with examples of applications to field data. Topics: acquisition geometries of land and marine 3-D seismic surveys, time vs. depth imaging, migration by Kirchhoff methods and by wave-equation methods, migration velocity analysis, velocity model building, imaging irregularly sampled and aliased data. Computational labs involve some programming. Lab for 3 units. 2-3 units, Spr (Biondi)

285. Earth Soundings Analysis—Convolution, spectra, discrete Fourier transform, Z-plane, feedback, adjoint operators, model fitting by least squares, time series analysis, missing data restoration, phase, resolution and random signals, signal entropy. 3 units, Win (Klemperer)

286. Electromagnetic Techniques in Geophysics—The general principles behind the electromagnetic techniques used to study the interior of the earth and to detect ore bodies, oil reservoirs, and underground man-made structures. Topics: the earth’s magnetic and electric fields, electromagnetic wave propagation through the earth (and through earth materials), electric and magnetic properties of earth materials, earth resistivity methods, magnetotellurics, magnetometers and magnetic-field gradiometers, electromagnetic induction, and ground-penetrating radar. Recommended: undergraduate electromagnetism. 4 units (Fraser-Smith) alternate years, not given 2001-02

287. Earthquake Seismology—Topics: basic theorems in elastodynamics, Green’s functions, attenuation, wave propagation in layered media, ray theory, seismic moment tensors, finite-source effects, kinematics and dynamics of earthquakes, engineering aspects of seismology. 3 units (Beroza) alternate years, given 2001-02

288. Crustal Deformation—Collection, reduction, and analysis of crustal deformation measurements for the study of relative plate motions, plate boundary deformation, earthquake and volcanic processes, postglacial rebound, and land subsidence. Mechanical models of faulting and magmatic deformation, coupled fluid flow and deformation, and inverse methods for analyzing data. 3 units (Segall) alternate years, given 2001-02
289. Global Positioning System in Earth Sciences—The basics of GPS, emphasizing monitoring crustal deformation with a precision of millimeters over baselines to thousands of kilometers long. Applications: mapping with GIS systems, airborne gravity and magnetic surveys, marine seismic and geophysical studies, mapping atmospheric temperature and water content, measuring contemporary plate motions, and deformation associated with active faulting and volcanism.  
3 units, Win (Segall) alternate years, not given 2001-02

3 units (Zoback) alternate years, not given 2001-02

296. Introduction to GIS: ARC/INFO and Arc-View—(Same as Geological and Environmental Sciences 296.) For graduate students; see 196.  
2 units, Win (Klemperer)

297. Research in the Application of Geographic Information Systems (GIS)—(Enroll in Geological and Environmental Sciences 297.)  
1-3 units, Aut, Win, Spr (Klemperer)

355. Report on Energy Industry Training—Provides on-the-job training for advanced doctoral students under the guidance of experienced, on-site supervisors. Students must submit a concise report detailing work activities, problems, assignments, and key results. Prerequisite: written consent of adviser.  
1 unit, any quarter (Staff)

355A. Imaging Radar and Applications—(Enroll in Electrical Engineering 355.)  
3 units, alternate years, given 2001-02

380A. 1 unit, Aut (Mavko)  
380B. 3 units, Aut (Mavko)

385. Research Seminar Series—Opportunity for advanced graduate students to frame and pursue research or thesis research within the context of one of the ongoing research projects in the department, and present thesis research progress reports before a critical audience on a regular basis. See 185 series for descriptions. Prerequisite: consent of the instructor.  
1-3 units, Aut, Win, Spr

385A. Reflection Seismology  
(Biondi, Claerbout)

385D. Topics in Crustal Fluids  
(Nur)

385E. Tectonics  
(Klemperer, Sleep, Thompson)

385K. Borehole Geophysics  
(Zoback)

385L. Earthquake Seismology, Deformation, and Stress  
(Segall, Zoback, Beroza)

385S. Seismic Tomography  
(Harris)

385V. Poroelasticity  
(Mavko)

385Y. Theoretical Ecology—(Same as Biological Sciences 384.)  
Spr (Roughgarden)

385X. Applied Geophysics  
(Staff)

385Z. Radar Remote Sensing  
(Zebker)

399. Teaching Experience in Geophysics—On-the-job training in the teaching of geophysics. An opportunity to develop problem sets and lab exercises, grade papers, and give occasional lectures under the supervision of the regular instructor of a geophysics course. Regular conferences with instructor and with students in the class provide the student teacher with feedback about effectiveness in teaching.  
2-4 units, any quarter (Staff)

400. Research in Geophysics  
any quarter (Staff)

PETROLEUM ENGINEERING

Emeriti: (Professors) William E. Brigham†, John W. Harbaugh*, Sullivan S. Marsden, Jr.  
Chair: Roland N. Horne  
Associate Chair: Thomas A. Hewett  
Professors: Khalid Aziz, Thomas A. Hewett, Roland N. Horne, Andre Journel†, Franklin M. Orr, Jr.  
Assistant Professors: Jef Caers, Anthony R. Kovscek  
Associate Professor (Research): Louis J. Durlofsky

Consulting Associate Professor: Clayton V. Deutsch  
† Joint appointment with Geological and Environmental Sciences  
† Recalled to active duty

Petroleum engineers are concerned with the design of processes for energy recovery from oil and gas reservoirs. Included in the design process are characterizing the spatial distribution of reservoir properties, drilling wells, designing and operating production facilities, selecting and implementing methods for enhancing fluid recovery, predicting recovery process performance, monitoring reservoirs, and examining the environmental aspects of petroleum exploration and production. The Department of Petroleum Engineering curriculum provides a sound background in basic sciences and their application to practical problems to address the complex and changing nature of the field. Course work includes the fundamentals of chemistry, computer science, engineering, geology, geophysics, mathematics, and physics. Applied courses cover most aspects of petroleum engineering and some related fields like geothermal engineering and geostatistics. The curriculum emphasizes the fundamental aspects of fluid flow in the subsurface. These principles apply equally well to optimizing oil recovery from petroleum reservoirs and remediating contaminated groundwater systems.

Faculty and graduate students in the department conduct research in a variety of areas including: enhanced oil recovery by thermal means, gas injection, and the use of chemicals; flow of fluids in pipes; geostatistical reservoir characterization and mathematical modeling; geothermal engineering; natural gas engineering; optimization; properties of petroleum fluids; reservoir simulation using computer models; and well test analysis. Undergraduate students are encouraged to participate in research projects. Graduate programs lead to the degrees of Master of Science (M.S.), Engineer, and Doctor of Philosophy (Ph.D.) in Petroleum Engineering.

M.S., Engineer, and Ph.D. degrees may be awarded with field designations for students who follow programs of study in the fields of geostatistics, geothermal, crustal fluids, or environmental specialties.

The department is housed in the Green Earth Sciences Building and operates laboratories for research in various enhanced oil recovery
processes and geothermal engineering. Students have access to a variety of computers for research and course work. Computers available for instruction and research include eight UNIX workstations and three multi-processor multi-user NT servers within the department, as well as extensive campus-wide computer clusters. Each graduate student office has one X-terminal per student.

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

The four-year program leading to the B.S. degree provides a foundation for careers in many facets of the energy industry. The curriculum includes basic science and engineering courses that provide sufficient depth for a wide spectrum of careers in the energy and environmental industries.

One of the goals of the program is to provide experience integrating the skills developed in individual courses to address a significant design problem. In Petroleum Engineering 180, taken in the senior year, student teams design facilities for a real petroleum reservoir to meet specific management objectives.

PROGRAM

The requirements for the B.S. degree in Petroleum Engineering are similar to those described in the “School of Engineering” section of this bulletin. Students must satisfy the University general education, writing, and language requirements. The normal Petroleum Engineering undergraduate program automatically satisfies the University General Education Requirements (GERs) in area 2a (Natural Sciences), area 2b (Technology and Applied Sciences), and area 2c (Mathematics). Engineering fundamentals courses and petroleum engineering depth and elective courses must be taken for a letter grade.

In brief, the credit and subject requirements are:

<table>
<thead>
<tr>
<th>Subject</th>
<th>Minimum Units</th>
</tr>

</table>

A list of suggested electives and sample course programs are available in the Department of Petroleum Engineering, room 65, Green Earth Sciences Building. It is important to start mathematics courses in the first year and engineering and geology early in the second year. Computers are used extensively in most petroleum engineering courses. Students must develop programming skills through appropriate course work and self-study and are expected to achieve fluency in the use of FORTRAN, C, or C++ by their junior year.

MINORS

To be recommended for a B.S. degree with Petroleum Engineering as a minor subject, a student must take the following courses in addition to those required by the major department or program: Pet. Engr. 120, 121, 130, 175, 180; Geol. & Envir. Sci. 111 and 151. In some programs, Geol. & Envir. Sci. 111 or 151 may also satisfy major requirements.

HONORS PROGRAM

A limited number of undergraduates may be admitted to the honors program at the beginning of their senior year.

To be admitted, the student must have a grade point average (GPA) of at least 3.0 in all course work in the University. In addition to the minimum requirements for the B.S. degree, the student must complete 6 units of advanced petroleum engineering courses and at least 3 units of research (Pet. Engr. 193).

Students who wish to be admitted to the honors program should consult with their adviser before the start of their senior year. Those who do not meet all of the formal requirements may petition the department for admission. Those completing the program receive the B.S. degree in Petroleum Engineering with Honors. An overall 3.5 GPA is required in all petroleum engineering courses for graduation with honors.

COTERMINAL B.S. AND M.S. PROGRAM

The coterminal B.S./M.S. program offers a unique opportunity for Stanford University students to pursue a graduate experience while completing the B.S. degree in any relevant major. Petroleum Engineering graduate students generally come from a variety of backgrounds such as chemical, civil, or mechanical engineering; geology or other earth sciences; or physics or chemistry. Students should have a background at least through Mathematics 130 and Computer Science 106 before beginning graduate work in this program.

The two types of M.S. degrees, the course work only degree, and the research degree, as well as the courses required to meet degree requirements are described below in the M.S. section. Both degrees require 45 units and may take from one to two years to complete depending on various circumstances unique to each student.

Requirements to enter the program are two letters of recommendation from faculty members or job supervisors, a statement of purpose, scores from the GRE general test, and a copy of Stanford University transcripts. While the department does not require any specific GPA or GRE
score, potential applicants are expected to compete favorably with graduate student applicants.

A Petroleum Engineering master’s degree can be used in a variety of ways. It is considered a terminal professional degree which prepares the student to obtain a professional job in the petroleum or geothermal industry, or in any related industry where analyzing flow in porous media or computer simulation skills are required. It can also be a stepping stone to a Ph.D. degree, which usually leads to a professional research job or an academic position.

Students should apply to the program any time after they have completed 105 undergraduate units, and in time to take Petroleum Engineering 120, the basic introductory course in Autumn Quarter of the year they wish to begin the program. Contact the Department of Petroleum Engineering to obtain additional information.

GRADUATE PROGRAMS

The University’s basic requirements for M.S., Engineer, and Ph.D. degrees are discussed in the “Graduate Degrees” section of this bulletin.

The energy industry provides a variety of employment opportunities for petroleum engineers with advanced training. A balanced master’s degree program including both engineering course work and research requires a minimum of one maximum tuition academic year beyond the baccalaureate to meet the University residence requirements. Most full-time students spend at least one additional summer to complete the research requirement. An alternative master’s degree program based only on course work is available that also requires at least one maximum tuition academic year to meet University residence requirements.

Students who anticipate continuing in the Ph.D. program should follow the research option. M.S. students receiving financial aid normally require two academic years to complete the degree. Such students must take the research option and are limited to a 9-unit course load per quarter.

The degree of Engineer requires a comprehensive maximum tuition two-year program of graduate study. This degree permits more extensive course work than the master’s degree, with an emphasis on professional practice. All Engineer’s degree students receiving financial aid are also limited to a 9-unit course load per quarter and need at least ten quarters of work to complete the degree.

The Ph.D. degree is awarded primarily on the basis of completion of significant, original research. Extensive course work and a minimum of three maximum tuition years of graduate work beyond the master’s degree is required. Doctoral candidates planning theoretical work are encouraged to gain experimental research experience in the M.S. program. Ph.D. students receiving financial assistance are limited to 9 units per quarter and often require more than three years to complete the Ph.D.

In special cases, the M.S., Engineer, and Ph.D. degrees may be awarded with field designations for students who follow programs of study in the particular fields of (1) geostatistics, (2) geothermal, (3) crustal fluids, or (4) environmental. For example, students may be awarded the degree Master of Science in Petroleum Engineering (Geothermal).

MASTER OF SCIENCE

The objective is to prepare the student for professional work in the energy industry through completion of fundamental courses in the major field and in related sciences as well as independent research.

Students entering the graduate program are expected to have an undergraduate-level petroleum engineering background. Competence in computer programming in a high-level language (Computer Science 106X or the equivalent) and knowledge of petroleum engineering and geological fundamentals (Petroleum Engineering 120, 130, 140, and Geological and Environmental Sciences 151) are prerequisites for taking most graduate courses.

The candidate must fulfill the following requirements:

1. Register as a graduate student for at least three quarters at maximum tuition or the equivalent of partial-tuition quarters.
2. Submit a Program Proposal for the Master’s Degree approved by the adviser during the first quarter of enrollment.
3. Complete 45 units with at least a grade point average (GPA) of 3.0. This requirement is satisfied by taking the Core Sequence, selecting one of the seven elective sequences, an appropriate number of additional courses from the list of technical electives, and completing 6 units of master’s level research. Students electing the “course work only” M.S. degree are strongly encouraged select an additional elective sequence in place of the research requirement. Students interested in continuing for a Ph.D. are expected to choose the research option and enroll in 6 units of Petroleum Engineering 361. All courses must be taken for a letter grade.
4. Students entering without an undergraduate degree in Petroleum Engineering must make up deficiencies in previous training. Not more than 10 units of such work may be counted as part of the minimum total of 45 units toward the M.S. degree.

Research subjects include certain groundwater hydrology and environmental problems, energy industry management, flow of non-Newtonian fluids, geothermal energy, natural gas engineering, oil and gas recovery, pipeline transportation, production optimization, reservoir characterization and modeling, reservoir engineering, reservoir simulation, and transient well test analysis.

RECOMMENDED COURSES AND SEQUENCES

The following list is recommended for most students. With the prior special consent of the student’s adviser, courses listed under technical electives may be substituted based on interest or background.

CORE SEQUENCE

Total units required for M.S. degree 45

* Students selecting the company sponsored "course work only" for the M.S. degree may substitute an additional elective sequence in place of the research.

TECHNICAL ELECTIVES

Technical electives from the following list of advanced-level courses usually complete the M.S. program. In unique cases, when justified and approved by the adviser prior to taking the course, courses listed here may be substituted for courses listed above in the elective sequence.

Geophys. 170. Fluids in the Earth's Crust 3
Geophys. 182. Reflection Seismology 3
Geophys. 190. Environmental and Applied Geophysics 4
Geophys. 202. Reservoir Geomechanics 3
Pet. Engr. 130. Well Log Analysis 3
Pet. Engr. 211. Computer Applications for Petroleum Engineers 3-4
Pet. Engr. 269. Geothermal Reservoir Engineering 3
Pet. Engr. 280. Oil & Gas Production Engineering 3
Pet. Engr. 281. Applied Mathematics in Reservoir Engineering 3

ENGINEER

The objective is to broaden training through additional work in engineering and the related sciences and by additional specialization.

Basic requirements include registering for at least six quarters at maximum tuition or the equivalent of partial-tuition quarters; completion of 90 units of course work including 15 units of research (Petroleum Engineering 362), and including all course requirements of the department's master's degree (39 units, excluding research). If the candidate has received credit for research in the M.S. degree, this credit ordinarily would be transferable to the Engineer degree, in which case a total of 9 additional research units would be required. No more than 10 of the 90 required units may be applied to overcoming deficiencies in undergraduate training.

At least 30 units in engineering and closely allied fields must be taken in advanced work, that is, work beyond the master's degree requirements and in addition to research (Petroleum Engineering 362). These may include courses from the Ph.D. degree list below or advanced-level courses from other departments with prior consent of the adviser. All courses must be taken for a letter grade. The student must have a grade point average (GPA) of at least 3.0 in courses taken for the degree of Engineer. A thesis based on 15 units of research must be submitted and approved by the adviser, another faculty member, and the University Committee on Graduate Studies.

DOCTOR OF PHILOSOPHY

The Ph.D. degree is conferred upon demonstration of high achievement in independent research and by presentation of the research results in a written dissertation and oral defense.

Basic requirements include a minimum of nine quarters of registration at maximum tuition or the equivalent in partial-tuition quarters of satisfactorily completed graduate study. Students must take at least 72 units beyond the 45 units required for the master's degree. The 72 units are composed of 36 units of research and 36 units of course work. The student's record must indicate outstanding scholarship. The student must pass the department's qualifying examination, submit an approved research proposal, fulfill the requirements of the minor department if a minor is elected, and pass the University oral examination, which is a defense of the dissertation. The student must prepare a dissertation based on independent research and that makes a significant contribution to the field.

The specification of 36 units of course work is a minimum; in some cases the research adviser may specify additional requirements to strengthen the student's expertise in particular areas. The 36 units of course work does not include teaching experience (Pet. Engr. 359), which is a requirement for the Ph.D. degree, nor any units in research seminars, which students are required to attend. All courses must be taken for a letter grade, with an average grade point average (GPA) of at least 3.25 in the 36 units of course work. The 36 units of course work may include graduate courses in petroleum engineering (numbered 200 and above) and courses selected from the following list. Other courses may be substituted with prior approval by the adviser. In general, non-technical courses are not approved.

MATH AND APPLIED MATH

Course No. and Subject Units
Aero. & Astro. 210A. Fundamentals of Compressible Flow 3
Aero. & Astro. 214A. Numerical Methods in Fluid Mechanics 3

Mech. Engr. 252C. Convective Heat Transfer 4

Ph.D. students are required to take the doctoral qualifying examination at the beginning of the second year of study. Students receiving a master's degree from the Department of Petroleum Engineering and continuing on for a Ph.D. are required to take the qualifying examination at the first opportunity after the completion of the requirements for the master's degree.

The qualifying examination consists of both a written and an oral section. The written part consists of three or four three-hour examinations on different subjects. The oral part is a three-hour examination in which
members of the department faculty question the student. Students are required to apply for candidacy for the Ph.D. degree after passing the department’s qualifying examination.

Within a year of passing the qualifying examination, the student must prepare a short written report that contains a literature review and a research proposal. This proposal must be approved after oral examination by a committee made up of the student’s adviser and two other faculty, one of whom must be from the department.

The dissertation must be submitted in its final form within five calendar years from the date of admission to candidacy. Candidates who fail to meet this deadline must submit an Application for Extension of Candidacy for approval by the department chair if they wish to continue in the program.

Ph.D. MINOR

To be recommended for a Ph.D. degree with Petroleum Engineering as a minor subject, a student must take 20 units of selected graduate-level lecture courses in the department. These courses must include Pet. Engr. 221 and 222. The remaining courses should be selected from Pet. Engr. 175, 223, 224, 225, 227, 280, 281, and 284.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

(AU) indicates that the course is subject to the University Activity Unit limitations (8 units maximum).

101. Energy and the Environment—(Same as Earth Systems 101.) Where the energy that powers society comes from, acknowledging that most current energy is generated from fossil resources. Case studies consider the consequences of current energy use patterns. Focus is on energy definitions, use patterns, resource estimation, pollution. Recommended: Mathematics 21 or 42, Engineering 30.

101Q. Stanford Introductory Seminar: Soap Bubbles, Raindrops, and Inkjets—Preference to sophomores. The behavior of bubbles and drops whose shapes are controlled by surface tension. Readings of Newton, Young, Laplace, and Plateau show how thinking about curved surfaces occupied scientists and mathematicians of the 18th and 19th centuries. A mathematical picture of a curved surface permits prediction of the shape of a bubble surface. The properties of curved surfaces determine many phenomena of daily life. Simple experiments and theory explore the physical manifestations of these curved liquid surfaces: the distribution of raindrops on a spider web, why sand grains stick together when damp, the design of a disposable diaper and the stability of a liquid jet in an inkjet printer. Prerequisite: Mathematics 42. GER:2b (DR:6)

110Q. Stanford Introductory Seminar: Soap Bubbles, Raindrops, and Inkjets—Alternate years, not given 2001-02

121. Fundamentals of Multiphase Flow—See 221.

122. Advanced Reservoir Engineering—Lectures, problems. Single-phase flow equations, tensor permeabilities, steady state and succession of steady state solutions. Radial flow and skin. Injectivity during fill-up...
of a depleted reservoir, injectivity for liquid-filled reservoirs, pattern elements. Flow potential and gravity forces, coning. Two-phase flow equations. Displacements in layered reservoirs, streamlines. Transient flow equation, primary drainage of a cylindrical reservoir, line source solution, pseudosteady state, pressure drawdown tests. Prerequisite: 221.

3 units, Win (Durlofsky)

223. Reservoir Simulation—Lectures, problems, and class project provide a thorough understanding of the fundamentals of petroleum reservoir simulation. Development of equations for multicomponent, multiphase flow between gridblocks comprising a petroleum reservoir. Relationships between black-oil and compositional models. Various techniques for developing black-oil, compositional, thermal, and dual-porosity models. Practical considerations in the use of simulators for predicting reservoir performance. Prerequisite: 221 and 246, or consent of instructor. Recommended: Mechanical Engineering 200C.

3-4 units, Win (Durlofsky, Aziz, Edwards)

3 units, Spr (Hewett) alternate years, not given 2001-02

3 units (Orr) alternate years, given 2001-02

3 units, Spr (Castanier) alternate years, not given 2001-02

227. Enhanced Oil Recovery—Lectures, problems. Introduction to the physics, theories, and methods of evaluating chemical, miscible, and thermal enhanced oil recovery projects. Existing methods and screening techniques, and analytical and simulation based means of evaluating project effectiveness. Dispersion-convection-adsorption equations, coupled heat, and mass balances and phase behavior provide requisite building blocks for evaluation.

3 units (Kovscek) alternate years, given 2001-02

230. Advanced Topics in Well Logging—(Same as Geophysics 230.) Designed to follow a course in standard well logging, and assumes knowledge of standard practice and application of electric well logs. Guest lectures on state-of-the-art tools and analyses; and the technology, rock physical basis, and applications of each measurement. Hands-on computer-based analyses illustrate instructional material. Prerequisite: 130 or equivalent.

3 units, Spr (Lindblom)

240. Geostatistics for Spatial Phenomena—(Same as Geological and Environmental Sciences 240.) Probabilistic modeling of spatial and/or time dependent phenomena. Kriging and cokriging for gridding and spatial interpolation. Integration of heterogeneous sources of information. Stochastic imaging of reservoir/field heterogeneities. Introduction to GSLIB software. Case studies from the oil and mining industry and environmental sciences. Prerequisites: introductory calculus and linear algebra, Statistics 116 or equivalent.

3-4 units, Win (Caers)

241. Practice of Geostatistics and Seismic Data Integration—(Same as Geological and Environmental Sciences 241, Geophysics 241.) Students build a synthetic 3D fluvial channel reservoir model with layer depths, channel geometry, and facies-specific petrophysical and seismic properties, stressing the physical significance of geophysical data. Reference data set is sparsely sampled, providing the sample data typically available for actual reservoir assessment. Geostatistical reservoir modeling uses well and seismic data, with results checked against reference database. All software provided (GSLib and SRFBtools). Recommended: basic prior experience with Unix, Matlab/Fortran programming. Prerequisites: 240.

3-4 units, Spr (Caers, Muerkji)

242. Topics in Advanced Geostatistics—(Same as Geological and Environmental Sciences 242A.) Conditional expectation theory and projections in Hilbert spaces; parametric vs. non-parametric geostatistics; Boolean, Gaussian, fractal, indicator, annealing approaches to stochastic imaging; multiple point statistics inference and reproduction; neural net geostatistics; Bayesian methods for data integration; techniques for upsampling hydrodynamic properties. May be repeated for credit. Prerequisites: 240, advanced calculus, Fortran/Unix.

3 units, Aut (Journal) alternate years, not given 2001-02

246. Reservoir Characterization and Flow Modeling with Outcrop Data—(Same as Geological and Environmental Sciences 246.) Project provides earth science students with an understanding of how to use outcrop observations in quantitative geological modeling and flow simulation, and addresses a specific reservoir management problem by studying a suitable outcrop analog (weekend field trip), constructing geostatistical reservoir models, and performing flow simulation. An introduction, through an applied example, to the relationship between the different disciplines. A different reservoir management question and outcrop analog is studied each year.

3 units, Aut (Aziz, Graham, Journal)

3 units, Aut (Kovscek)

255. Master's Students' Report on Energy Industry Training—Provides on-the-job training for master's degree students under the guidance of experienced, on-site supervisors. Students must submit a concise report detailing work activities, problems, assignments, and key results. Prerequisite: consent of adviser.

1 unit, Sum (Staff)

3 units (Staff) not given 2000-01
268. Seminar in Petroleum Engineering
1 unit, any quarter (Staff)

269. Geothermal Reservoir Engineering—Conceptual models of heat and mass flows within geothermal reservoirs. The fundamentals of fluid/heat flow in porous media; convective/conductive regimes, dispersion of solutes, reactions in porous media, stability of fluid interfaces, liquid and vapor flows. Interpretation of geochemical, geological, and well data to determine reservoir properties/characteristics. Geothermal plants and the integrated geothermal system.
3 units, Spr (Horne) alternate years, not given 2001-02

1-3 units, any quarter (Staff)

280. Oil and Gas Production Engineering—(Same as 180.) Design and analysis of production systems for oil and gas reservoirs. Topics: well completion, single-phase and multi-phase flow in wells and gathering systems, artificial lift and field processing, well stimulation, inflow performance. Prerequisite: 120. Recommended: 130. (WIM)
3 units, Aut (Kovscek, Aziz)

3 units (Horne) alternate years, given 2001-02

3 units, Aut (Caers)

285A,B,C,D,E,F,G. Research Seminars—Focused study in research areas within the department. Graduate students may participate in advanced work in areas of particular interest prior to making a final decision on a thesis subject. Prerequisite: consent of instructor.

285A. Research Seminar: Enhanced Oil Recovery—Current research in the SUPRI-A group. Thermal and enhanced oil recovery. (AU)
1 unit, Aut, Win, Spr (Kovscek, Castanier, Brigham)

285B. Reservoir Simulation—Current research in SUPRI-B (Reservoir Simulation) program. (AU)
1 unit, Aut, Win, Spr (Aziz, Durlofsky, Edwards)

285C. Research Seminar: Gas Injection Processes—Current research in the SUPRI-C group. (AU)
1 unit, Aut, Win, Spr (Orr)

285D. Research Seminar: Well-Test Analysis—Current research in the SUPRI-D well test analysis group. (AU)
1 unit, Aut, Win, Spr (Horne)

285F. Research Seminar: Geostatistics—Current research in the SCRF (Stanford Center for Reservoir Forecasting) program. (AU)
1 unit, Aut, Win, Spr (Journel, Hewett, Caers)

285G. Research Seminar: Geothermal Reservoir Engineering—Current research in the geothermal energy group. (AU)
1 unit, Aut, Win, Spr (Horne)

285H. Research Seminar: Horizontal Well Technology—Current research in SUPRI-HW (productivity and injectivity of horizontal wells) program. (AU)
1 unit, Aut, Win, Spr (Aziz, Durlofsky)

355. Doctoral Report on Energy Industry Training—Provides on-the-job training for doctoral students under the guidance of experienced, on-site supervisors. Students must submit a concise report detailing work activities, problems, assignments, and key results. Prerequisite: consent of adviser.
1 unit, Sum (Staff)

359. Teaching Experience in Petroleum Engineering—On-the-job training in teaching petroleum engineering. Student prepares and presents several lectures, problem sets, grades problems, and prepares lab experiments under the supervision of regular instructor. Performance is evaluated by students and the regular instructor.
1-3 units, any quarter (Staff)

360. Advanced Work in Petroleum Engineering—Graduate-level work in experimental, computational, or theoretical research.
1-9 units, any quarter (Staff)

1-6 units, any quarter (Staff)

362. Engineer’s Thesis Research in Petroleum Engineering—Graduate-level work in experimental, computational, or theoretical research. Advanced technical report writing. Limited to 15 units total, or 9 units total if 6 units of 361 were previously credited.
1-9 units, any quarter (Staff)

1-9 units, any quarter (Staff)

1-15 units, any quarter (Staff)
School of Education

Dean: Deborah J. Stipek (after January 1, 2001)
Interim Dean: Denis C. Phillips (Summer)
Associate Dean for Academic Affairs: Denis C. Phillips
Associate Dean for Administration: Vicki Oldberg
Associate Dean for External Relations: Patricia Nicholson

Associate Professors: Arneha Ball, Joanne T. Boaler, Patricia J. Gumport, Teresa C. LaFrancoise, David Rogosa, Daniel Schwartz

Assistant Professors: Anthony L. Antonio, Brigid J. Barren, Mike Copernus, Leta L. Cosentino, Linda Darling-Hammond, Karen E. Mundy, Deanne R. Perez-Granados, Nathaniel L. Gage*, Alvin Hannum, Kemal Haji, Charles J. Haertel, Jeffrey E. Hilsenrath, Catherine J. Hinds, Philip A. James, Robert Reich

Consulting Professors: Robert Reich

Senior Lecturer: Philip Hubbard

Lecturers: Margaret Azevedo, Colin Haysman, Cathy Humphreys, James Montoya, Celia Moreno, Kathleen Morrison, Denis C. Pope, Ann Porteus, Susan Schultz, Lee Swanson, Ann Vosovic, Lori White

Acting Assistant Professors: Susan Christopher, Diana Rhoten

Consulting Professors: George Bohnstedt, Jay Chambers, David Pettermann, John W. Gardner, Jr., Thomas Parrish

Consulting Associate Professor: Charla Rolland Shelton

Visiting Professors: Paul Black, Joshua A. Fishman, Ann Lieberman, Sheldon Rothblatt

* Recalled to active duty.

The School of Education prepares scholars, teachers, teacher educators, counseling psychologists, policy analysts, evaluators, researchers, administrators, and other educational specialists. Four graduate degrees with specialization in education are granted by the University: Master of Arts, Master of Science in Education, Master of Education, and Doctor of Philosophy. While no undergraduate majors are offered, the school provides a number of courses for undergraduates, an undergraduate honors program, and a variety of tutoring programs.

The School of Education is organized into three Program Area Committees: Curriculum Studies and Teacher Education (C&TE); Psychological Studies in Education (PSE); and Social Sciences, Policy, and Educational Practice (SSPEP).

In addition, four cross-area programs are sponsored by faculty from more than one area. These programs include the doctoral Symbolic Systems Program and three master's level programs: the Stanford Teacher Education Program (STEP); the Prospective Principals Program (PPP); and the Learning, Design, and Technology Program (LDT).

These committees and programs function as administrative units that act on admissions, plan course offerings, assign advisers, and determine program requirements. Various subspecialties or concentrations exist within most of these areas and programs. Faculty members are affiliated primarily with one area but may participate in several programs. While there is a great deal of overlap and interdisciplinary emphasis across areas and programs, students are affiliated with one area committee or program and must meet its degree requirements.

Detailed information about admission and degree requirements, faculty members, and specializations related to these area committees and programs can be found in the publication School of Education Guide to Graduate Studies and at http://www.stanford.edu/dept/SUSE.

The School of Education offers an eight-week summer session for admitted students only. The school offers no correspondence or extension courses.

UNDERGRADUATE PROGRAMS

The School of Education focuses on graduate education and research training and does not offer an undergraduate major. However, undergraduate education is of concern to the school, and courses and programs are available to those interested in the field of education. Several courses at the 100 level are especially designed for undergraduates, and some higher-level courses are open to undergraduates. An honors program is available to undergraduates to supplement their regular majors outside the school. In conjunction with the Haas Center and the Undergraduate Advising Center, the school offers a variety of courses for undergraduates interested in developing educationally oriented skills.

HONORS PROGRAM

This program permits interested and able undergraduates at Stanford to build on the training received in their major field of study by pursuing additional courses and a research or practicum project in a related area of education.

Students apply for entry during the junior year. Applications are available at the Dean's office in Cubberley, room 101, or at http://www.stanford.edu/dept/SUSE/navigations programsnavfrm.html. At least one course must be taken from each of the following areas:

1. Educational policy and history in the U.S.: courses include American Education and Public Policy; History of Education in the United States; Children, Civil Rights, and Public Policy in the U.S.; Introduction to the Study of International Comparative Education; History of Higher Education in the U.S.

2. Contemporary problem areas: courses include Urban Youth and Their Institutions: Research and Practice; Theory and Issues in the Study of Bilingualism; Education and the Status of Women: Comparative Perspectives; Contemporary Social Issues in Child and Adolescent Development.

3. Foundational disciplines: courses include Social Sciences and Educational Analysis; Problems in Sociology of Education; Problems of Intelligence, Information, and Learning; Introduction to Philosophy of Education.

A directed reading course as well as directed research courses with a faculty member in Education is also required. Students in the program should enroll in the Undergraduate Honors Seminar, 199A,B,C during their senior year.

Near the end of Spring Quarter, successful candidates for honors orally present brief reports of their work and findings at a mini-conference. All honors students in Education are expected to attend this conference.

COTERMINAL DEGREE PROGRAM

The School of Education admits a small number of students from undergraduate departments within the University into a coterminous A.B. and A.M. program. Not all of the four area committees offer coterminous degrees. Students in such a program receive the bachelor's degree in their undergraduate major and the master's degree in Education. Approval of the student's undergraduate degree and of the School of Education is required. Undergraduates may apply when they complete 105 units, but no later than the end of the 11th quarter of undergraduate work. Students study for both the bachelor's and master's degrees simultaneously and must complete a total of 15 full-tuition quarters or three full-tu-
The minimum unit requirement is 36 quarter units earned at Stanford as the School of Education's Academic Services Office. Coterminal applicants require within the School of Education; the minimum is 36 units. Applicants may obtain coterminal degree application materials from the School of Education's Academic Services Office. Coterminal applicants may also consult with Graduate Admissions regarding eligibility.

**GRADUATE PROGRAMS**

Several advanced degree programs are offered by the School of Education and are described below. Requirements vary somewhat across programs. Both University and School of Education requirements must be met for each degree. The University requirements are detailed in the "Graduate Degrees" section of this bulletin. Students are urged to read this section carefully, noting residency, tuition, and registration requirements. A student who wishes to enroll for graduate work in the School of Education must be qualified and admitted to graduate standing by one of the school's area committees.

Complete information about admissions procedures and requirements is available by writing Stanford University Graduate Admissions, Old Union, Room 137, Stanford, CA 94305-3005 or at http://www.stanford.edu/dept/SUSE/. The admissions packet includes the publication *School of Education Guide to Graduate Studies*, which outlines degrees, programs, admission and graduation requirements, and research interests of the faculty. All applicants must submit scores from the Graduate Record Examination General Test (verbal, quantitative, and analytical areas); TOEFL scores are also required from those whose first language is not English.

**MASTER OF ARTS**

The A.M. degree is conferred by the University upon recommendation of the faculty of the School of Education and the University Committee on Graduate Studies. The University residency requirement is three full-tuition quarters of registration as a graduate student at Stanford. The minimum unit requirement is 36 quarter units earned at Stanford as a graduate student. Some programs require as many as 45 units. At least 12 units must be taken for a grade point average (GPA) of 'B' or better, and a minimum of 18 units must be taken in the School of Education. Master's students should obtain detailed program requirements from the master's coordinator, located in Academic Services in the School of Education. No thesis is required to earn a master's degree; however, some programs require a final project, paper, or monograph. Additional detailed information regarding entrance and degree requirements is available at http://www.stanford.edu/dept/SUSE/ and in the School of Education Guide to Graduate Studies. Upon admission, each student is assigned a faculty adviser from the appropriate area committee to begin early planning of a coherent program. Master of Arts degrees are offered for the following specialties (the sponsoring area committee and concentration is listed in parentheses):

- Art Education (C&TE)
- Dance Education (C&TE)
- English Education (C&TE)
- Evaluation (SSPEP-APA)
- General Curriculum Studies (C&TE)
- International Comparative Education (SSPEP-ICE)
- International Educational Administration and Policy Analysis (SSPEP-ICE)
- Joint Program with Graduate School of Business (SSPEP-APA)
- Learning Design and Technology (Cross-Area)
- Mathematics Education (C&TE)
- Policy Analysis (SSPEP-APA)
- Prospective Principals Program (SSPEP-APA)
- Science Education (C&TE)
- Social Sciences in Education—Interdisciplinary (SSPEP-SSE)*
- Teacher Education (C&TE)

* Within this program, students may pursue interests in gender issues, language, and social science areas represented in SSE.

In addition, an A.M. degree with a teaching or administrative credential is offered in Stanford Teacher Education Program (Cross-Area—STEP).

**STANFORD TEACHER EDUCATION PROGRAM (STEP)**

STEP offers a Master of Arts program to prepare humanities and sciences college graduates for careers as secondary teachers of English, languages (French, German, Japanese, Spanish), mathematics, science (biology, chemistry, physics), and social studies. To be successful in classrooms with diverse students, STEP helps participants become more aware of their values, more flexible in their teaching and learning styles, and more knowledgeable in their subject matter.

The 12-month STEP year begins in June with a summer quarter of intensive academic preparation and experience in the Stanford Summer Teaching School. During the academic year, students take courses in professional education and academic subjects; they also teach part-time in middle or high schools for the entire public school year. The master's degree and Single Subject (secondary) Teaching Credential require 45 quarter units, taken during four quarters of continuous residency.

Applicants are required to pass the California Basic Educational Test (CBEST), and must demonstrate subject matter competence in one of two ways: (1) by passing the Praxis II and SSAT subject assessment tests in their field, or (2) by completing a California state-approved subject matter preparation program. For further information, contact STEP Academic Services at (650) 723-2110.

STEP also includes the optional California Cultural Language and Academic Development (CLAD) emphasis program. CLAD provides enhanced opportunities for candidates to learn about and work with linguistically and ethnically diverse students. The program focuses on theories of language acquisition, English as a second language methodologies, and development of cross-cultural understanding and appreciation of multicultural diversity. Further information regarding admission requirements, course work, and credential requirements is available at http://www.stanford.edu/dept/SUSE/ and in the School of Education Guide to Graduate Studies.

**PROSPECTIVE PRINCIPALS PROGRAM (PPP)**

The Prospective Principals Program at Stanford offers the A.M. degree with a specialization in Administration and Policy Analysis, which can be combined with the Preliminary Administrative Services Credential. It enables prospective principals to become leaders and to manage ideas, resources, and themselves to achieve worthwhile educational results for a diverse student population. This is accomplished through three consecutive summers of full-time study and is therefore available to persons working in a school system during the academic year. Teaching experience is a prerequisite for admission to this program. This master's degree requires 45 quarter units. In order to qualify for the credential, three additional quarter units for a total of 48 quarter units, including internship units, are necessary. Additional information regarding admission requirements, course work, and credential requirements is available in the School of Education Guide to Graduate Studies.

**MASTER OF ARTS IN TEACHING (SUBJECT)**

The degree of Master of Arts in Teaching (M.A.T.) is reserved for experienced teachers or individuals who have completed a program of teacher preparation; it is offered in conjunction with a variety of academic departments in the School of Humanities and Sciences. Further details are available from the A.M. programs office in the School of Education.

**DOCTORAL DEGREES**

The School of Education offers two types of doctoral degrees. The Doctor of Philosophy (Ph.D.) degree is offered by all program area committees. The Doctor of Education (Ed.D.) degree is offered only in the concentrations of Policy Analysis and Higher Education Administration within the area of SSPEP. Both degrees are conferred by the University upon recommendation by the faculty of the School of Education and the University Committee on Graduate Studies. University residency requirements (nine full-tuition quarters or the equivalent), amount of trans-
The two doctoral degrees offered in the School of Education differ in emphasis, purpose, and the intended careers of those who pursue them. They are equivalent with respect to the amount of time required and the rigor and quality of work demanded. In the Ph. D. degree program, there is greater emphasis on theory and research; the emphasis in the Ed.D. program is on informed and critical applications of existing knowledge to educational practice.

The Ph.D. degree is designed for students who are preparing for (1) research work in public school systems or specialized institutions; (2) teaching roles in education in colleges or universities, and research connected with such teaching; or (3) other careers in educational administration and research.

The Ed.D. degree is a professional educational degree intended to meet the needs of (1) those who wish a thorough and comprehensive professional understanding of and competence in dealing with educational problems met by administrators, supervisors, and curriculum specialists; and (2) those who wish a scholarly preparation for teaching education in colleges or universities.

Ph.D. students must complete a minor in another discipline taught outside the school, or hold an acceptable master’s degree outside the field of education, or complete an approved distributed minor that combines relevant advanced work taken in several disciplines. A minor is not required for the Ed.D.

Upon admission, an adviser assigned from the admitting area committee works with the student to establish an appropriate and individualized course of study, a relevant minor, and project research plans. Other faculty members may also be consulted in this process. Details about the varying administrative and academic requirements for each area committee and the School of Education, along with general time frame expectations, are given at http://www.stanford.edu/dept/SUSE/ and in the School of Education Guide to Graduate Studies. Complete guidelines may be obtained from the specific area committees.

The following courses are offered by the Undergraduate Advising Center (UAC). The UAC provides and coordinates services to help student and adviser work together toward the establishment and accomplishment of the student’s academic and personal goals. For detailed description of services and advising resources, see http://uac-server.stanford.edu/.

The UAC is on the first floor of Sweet Hall, and is open Monday through Friday 9:00 a.m. to 12:00 noon and 1:00 to 5:00 p.m., telephone: (650) 723-2426.

50. Accelerated Learning—Interactive, providing various methods for approaching difficult concepts which cannot be comprehended even after multiple efforts. The techniques for active learning, making it possible to accelerate the process of conquering difficult concepts while also achieving higher levels of understanding. Learn how to identify your individual style and channels, practice locating areas of confusion, and formulate workable, individualized approaches.

1 unit, Aut, Spr (Townsend)

1 unit, Win (Matthies, Worline)

52. Practices in Critical Thinking—Critical thinking is one of the most important skill sets we need to be successful in college and in the workplace across subject areas. It encompasses knowing how to find assumptions, recognize ambiguity, evaluate arguments, and judge the credibility of sources of expert opinion. To think critically in one’s daily
life and studies requires being comfortable with questions instead of answers, complexity instead of simplicity, uncertainty instead of certainty. These abilities are developed through practical exercises based on contemporary issues and through practice with tests from a variety of disciplines. Emphasis is on the value of developing a questioning mind and the importance of differentiating between academic and intellectual motivation.

3 units, Sum (Townsend)

53. Working Smarter through Precision Questioning—When life-long reading or classroom work is driven by questions, concentration is better, recall is more complete, motivation improves. Understanding the basic categories of questions and their interrelationships enables us to be more precise, better organized, and more critical. In-class exercises provide incrementally complex question ladders and increase skills in delivering questions and answers.

2 units, Win (Townsend)

54. Reading Faster—Coping with information overload requires speed reading as it traditionally has been defined, and the ability to overview, skim, extract, browse, and navigate through hypertext. To decide what is worth reading, quick and reliable judgments must be made about relevance and credibility. Academic texts, technical manuals, major newspapers, etc.

1 unit, Aut, Spr (Townsend)

55. Think On Your Feet—Learn how to be effective in small group discussions; quickly grasp the point being made, the supporting arguments, and the nature of the responses to arguments on the other side of the question. Increase your capacity for effective teamwork through in-depth, collaborative thinking exercises. Practice presenting your ideas to your peers and colleagues so that you are prepared to take advantage of Stanford’s numerous small group courses.

2 units, Win (Townsend)

EDUCATION

955. Issues in Leadership—Priority given to undergraduates and master’s degree students. Basic theories and concepts in leadership and group process. Topics: identification of core values, building shared vision, group problem solving, leadership styles, decision-making, power and influence, conflict management, ethical dilemmas, community building, and personal policy development. Interactive and experiential, and for students currently in leadership positions in the University or who have jobs or volunteer roles where they are working in groups. Enrollment limited to 24. (SSPEP)

3-4 units, Win (Porteus)

102. Culture, Class, and Educational Opportunity—Upward Bound and EPASSA counselors work with students from educationally disadvantaged backgrounds. Topics: language education, culture and family, class management, school finance, and community-school relations. Mandatory school visits and classroom observations. Enrollment limited to 15. (SSPEP)

4 units, Spr (Padilla)

106. Interactive Media in Education—Introduction to the use of interactive media in formal education. Workshop views/uses commercial interactive media for education and analyzes/criticizes them. Ideas are used to interpret/understand the experience of learning with interactive media. (CTE)

3-5 units, Sum (Walker)

107. The Politics of International Cooperation in Education—for undergraduates and master’s students; see 306B.

3-4 units, Spr (Mundy)

109X. The Politics of Language Education in California Schools—Controversies surrounding language and educational policies pertaining to African Americans and English language learners are explored in the wake of legislation that was formulated to restrain curricula for language minority students throughout California. Interdisciplinary studies of language in schools and society are compared to legislation and educational policies within their historical and political contexts.

3-4 units, Win (Bough)

120. Symbolic Systems Seminar: Problems in Intelligence, Information, and Learning—Interdisciplinary topics in cognitive science, e.g., modularity, representation, reasoning, situated action, or creativity. Prerequisites: Computer Science 109, Linguistics 120 or 130, Philosophy 80, Psychology 40, or consent of instructors.

3 units (Green, Wasow) not given 2000-01

130. Introduction to Counseling—The theories and techniques of counseling, emphasizing the clients’ individual and cultural differences, and construction of one’s own theory of the counseling process and outcome. Two psychotherapeutic theories, cognitive-behavioral and existential-humanistic, are supplemented with a third theory of each student’s choice. Experiential, problem-based focus on how to develop self-awareness and conceptual understandings of the counseling process in culturally diverse contexts. (PSE)

3 units (Staff) not given 2000-01

136. World, Societal, and Educational Change: Comparative Perspectives—See 306D. (SSPEP/ICE)

4-5 units (Ramirez) not given 2000-01

137Q. Stanford Introductory Seminar: Conceptualizing Human Motivation—East and West—Preference to sophomores. What motivates behavior? This question is linked to one’s view of human nature and the relationship between individuals and their social worlds. The multiple perspectives on human motivation, including Western psychological traditions and the contemplative spiritual psychologies of the East. Historical and cross-cultural approaches to understanding how different traditions treat motivation. Readings from personality, clinical, and developmental psychology, and from Eastern psycho-spiritual traditions such as Buddhism and yoga. How world views of human nature and development are related to theories of human motivation. Prerequisite: introductory psychology.

3 units, Spr (Roeser)

138Q. Stanford Introductory Seminar: Educational Testing in American Society—Preference to sophomores. Tests are used for college admissions, program evaluation, and educational reform. In the classroom, grades are used to communicate about achievement, and sometimes to reward effort, improvement, or good behavior. Explanations for group and individual differences in test performance have been controversial this century, right up to current debates over affirmative action. The purposes and the logic of various testing programs, including classroom testing, admissible testing, and national testing programs. The meanings of reliability, validity, bias, and fairness in testing, developing the notion of validity argument as a conceptual tool for analyzing testing applications. Paper on some educational testing application.

3 units (Haertel) not given 2000-01

141. Race, Education, and the Media—See 241. (SSPEP/APA)

5 units (Carnoy, Steyer) not given 2000-01

149. Theory and Issues in the Study of Bilingualism—For undergraduates; see 249.

3-4 units, Aut (Valdés)

150X. Introduction to Data Analysis and Interpretation—Primarily for master’s students. Provides rudimentary data analysis skills with a focus on reading literature and interpreting statistics and statistical models, especially those commonly found in education. Topics: descrip-
tive statistics and displays, simple and multiple regression, contingency tables, t-test, and simple analysis of variance.

4 units, Aut (Porteus)

151X. Introduction to Qualitative Research Methods—Primarily for master’s students. Introduces students to issues, leading ideas, and methods in qualitatively-oriented educational research. Check with the relevant instructor for more details of the syllabus.

4 units, Aut (Fetterman, Pope)
Win (Peshkin)

155. Development of Measuring Instruments—For students planning to develop written or performance tests or questionnaires for research and evaluation, and for teachers wishing to improve classroom examinations. Planning tests, writing items, item tryout and criticism, qualities desired in tests, and interview techniques. Lectures, case studies, and practical exercises. (PSE)

3 units (Haertel) not given 2000-01

156X. Understanding Racial and Ethnic Identity—African American, Native American, Mexican American, and Asian American racial and ethnic identity development is explored to better understand the influence of social/political and psychological forces in shaping the experience of people of color in the U.S. Issues: the relative salience of race in relationship to other social identity variables, including gender, class, occupational, generational, and regional identifications. Bi- and multiracial identity status, and types of white racial consciousness. GER:4b(DR-3)

5 units (LaFromboise) not given 2000-01

158. Children’s Citizenship: Justice across Generations—(Enroll in Political Science 158R.)

5 units (Reich) given 2001-02

160. Introduction to Statistical Methods in Education—(Master’s students register for 150X.) Introduction to quantitative methods in educational research for doctoral students with little or no prior statistics. Organization of data, descriptive statistics, elementary methods of inference, hypothesis testing, and confidence intervals. Computer package used. Students cannot also receive credit for Psychology 60, or for Statistics 60 or 160. (All Areas)

4 units, Aut (Hakuta)

3 units (Rogosa) not given 2000-01

164X. Developing Academic English: Methods for Teaching ESL in American High School—Introduction to theories and methods for instruction in English as a second language. Broad overview of approaches and methods used in language teaching focusing specifically on practices that can support the development of those language proficiencies needed by non-English-background students in order to succeed in American schools. (CTE-STEP)

2-4 units (Valdes) not given 2000-01

165X. History of Higher Education in the U.S.—(Same as 265X.) Introduction to historical perspectives on the development of higher education. Readings/discussions address the major periods of evolution, emphasizing the mid-19th century. Premise: insights into contemporary higher education can be obtained by examining its antecedents, particularly issues of governance, mission, access, curriculum, and the changing organization of colleges and universities. (SSPEP-APA)

3-5 units, Win (Rothblatt)

166X. Teaching Reading, Writing, and the Language Arts—For STEP students. Focus is on the application of and psychological principles in understanding, assessing, and supporting the reading and writing processes, and the acquisition of literacy, especially in secondary school settings. Key concepts: language acquisition, perception, cogniton, motivation, and individual differences. (STEP)

3 units, Sum (Ball)

167X. Educating for Equity and Democracy—Introduction to the theories and practices of equity and democracy in education. How to think about teaching and schooling in new ways; the individual moral and political reasons for becoming a teacher. (STEP)

3 units, Sum (Staff)

170. Gender and Education—The concept of gender in educational contexts, focusing on formal schooling from elementary to graduate education, primarily within the U.S. What gender differences exist, what difference gender makes in various educational settings. Lecture/discussion and group activity formats consider the relationship between gender and education from social science perspectives. The advantages and disadvantages of different kinds of research about gender and education using data that are ethnographic, experimental, historical, statistical, and narrative. (SSPEP)

4 units, Aut (Christopher)

177X. Education of Immigrant Students: Psychological Perspectives—(Same as 277X.) Historical and contemporary approaches to educating immigrant students. Case study approach focuses on urban centers to demonstrate how stressed urban educational agencies serve immigrants and native-born U.S. students when confronted with overcrowded classrooms, controversy over curriculum, current school reform movements and government policies regarding equal educational opportunity. (SSPEP)

4 units, Win (Padilla)

179. Urban Youth and their Institutions: Research and Practice—(Same as 279.) The determinants and consequences of urban life for youth, emphasizing disciplinary and methodological approaches to the study of policies and practices and the growing gap between the perspectives of state and local organizations and those of youth and their communities. The diversity of urban youth experiences with respect to ethnicity, gender, and immigration histories: case studies illustrate civic-level and grassroots institutions, their structures, networks, and philosophies; historical and contemporary examination of diverse realities of urban youth for policymakers, educators, and researchers. Enrollment limited. Prerequisite: consent of instructor. (SSPEP/APA)

3-4 units, Aut (McLaughlin)

180. Directed Reading in Education—For undergraduates and master’s degree students. (All Areas)

1-15 units, any quarter (Staff)

190. Directed Research in Education—For undergraduates and master’s degree students. (All Areas)

1-15 units, any quarter (Staff)

192A. Peer Tutor Training—Readings/discussions of videotapes, and individual and group projects. Topics: problem-solving, study skills, effective listening and feedback, cross-cultural sensitivity; and teaching with questions. Short internship required for new tutors.

1 unit, Aut, Spr (Freeman)

192B. Peer Tutoring in Writing—Writing tutors become familiar with the written work of fellow students and learn how to comment on it helpfully. Tutoring skills are developed through listening to experienced tutors; reflecting on our own writing processes; considering sample
writing projects; role-playing tutoring situations; and discussing reading, assignments, and projects.

2 units, Spr (Freeman)

193A. Peer Counseling: Bridge Community—Instruction in peer counseling. Topics: verbal and non-verbal skills, the use of open and closed questions, paraphrasing, working with feelings, summarization, and integration. Lectures, individual training, group exercises, role-play practice with optional video feedback. Sections on the relevance to crisis counseling and student life. Guest speakers from university and community agencies. Students develop and apply skills in a variety of settings in the University.

2 units, Aut, Win (Moreno)

193B. Peer Counseling: Chicano Community—Instruction in basic counseling. Topics: verbal and non-verbal attending and communication skills, the use of open and closed questions, working with feelings, summarization, and integration. Counseling issues that may be salient when working with Chicanos, including the significance and process of Spanish-English code switching in communication, the role of ethnic identity in self-understanding, the relationship of culture to personal development, and the experience of Chicano students in university settings. Lectures, individual training, group exercises, discussion, role-play, and videotape practice.

2 units, Aut (Martinez)

193C. Peer Counseling: The African-American Community—Instruction in peer counseling with Blacks. Topics: the concept of culture, Black cultural attributes and their effect on Blacks’ reactions to accepting counseling, verbal and non-verbal attending, the use of open and closed questions, working with feelings, summarization, and integration. Geared toward counseling with Blacks; methods of instruction include reading assignments, lectures, guest speakers, group discussion, role-play, and videotaped practice. Students develop and apply skills in the Black community on campus or in other settings that the student may choose.

2 units, Aut (Edwards, Reed-Hoskins)

193F. Peer Counseling: The Asian American Community—Topics: the Asian family structure, concepts of identity, ethnicity, culture, and racism in terms of their impact on individual development and the counseling process. Emphasis is on the development of an appreciation and empathic understanding of Asians in America. Lectures, readings, discussion, and group exercises.

2 units, Win (Brown)

193N. Peer Counseling in the Native American Community—Instruction in basic counseling techniques. Topics: verbal and non-verbal communication, strategic use of questions, methods of dealing with strong feelings, and conflict resolution. Emphasis is on how basic elements of counseling apply to Native Americans, including client, counselor, and situational variables in counseling, the significance of non-verbal communication, the role of ethnic identity in self-understanding, the relationship of culture to personal development, the impact of family on personal development, gender roles and Native American families, and the experience of Native American Indian students in university settings. Lectures, individual skill development, group exercises, and role practice.

2 units, Win (Simms, Martinez)

193P. Peer Counseling Practicum—For those who continue to study counseling methods while counseling students.

1-5 units, Aut, Win, Spr (Moreno)

194. Leadership in Academic Advising—Focus is on the skills needed to be an active leader in the academic advising process through the role of Head Advising Associate, taught simultaneously with the HAA selection process through the Undergraduate Advising Center. Student development theory as it applies to the advising process for freshmen and sophomore students. Workshops, focus groups, guest speakers, role playing, and case studies develop listening and counseling skills, ask critical questions, and learn about group facilitation. Corequisite: students must be applying for the position of Head Advising Associate for 2000-01.

2 units, Aut, Spr (Freeman)

196X. Feminist Theories of Work and Families—(Same as Feminist Studies 102L) A critical introduction to feminist theories of work, families, and the interactions between the two. The economic, sociological and legal perspectives; mainstream and feminist theories are contrasted. Emphasis is on the present day U.S. with issues in other countries and/or other historical periods. Topics: labor force participation, occupational segregation, labor market discrimination, emotional labor, unpaid work, caring labor, child care, combining work and family, single-parent families, poverty, marriage, and divorce.

4-5 units, Win (Freeman)

197. Education and the Status of Women: Comparative Perspective—Theories and perspectives from the social sciences relevant to understanding the role of education in changing, modifying, or reproducing structures of gender differentiation and hierarchy. Cross-national research on the status of women and its uses to evaluate knowledge claims from varying perspectives. (SSPEP) GER:4c (DR:1)

4-5 units, Win (Wotipka)

199A, B, C. Undergraduate Honors Seminar—Required for all juniors and seniors in the honors program in the School of Education. Supports students’ actual involvement and apprenticeships in educational research. Participants are expected to share ongoing work on their honors thesis. Prerequisite: consent of instructor.

1 unit, Aut, Win, Spr (Powell)

200. The Work of Art and the Creation of Mind—Collaboration between the Art, Dance, Drama, and Music programs, and the School of Education examines the relationship between the work of art and the creation of mind, i.e., the work of art as a task of making something and as a form that has been made. The ways a conception of art develops and defines the mind. Discussion, readings, and observation of artists at work. The relationship between forms of art and forms of thought. What does either the perception or creation of art in any of its forms do to how we think and know? (CTE)

4 units, Win (Hannah, Rehm, Ross, Sano)

201. History of Education in the United States—Analysis of selected turning points in education in relation to religion, political socialization, race relations, gender, immigration, and urbanization. Limited enrollment. (SSSEP)

3 units, Aut (Williamson)

201A. History of African American Education through 1940—A survey of pivotal points in African American educational history, including literacy attempts during slavery, the establishment of historically Black colleges and universities, the debate between liberal and vocational education, and Black student rebellions on campuses. (SSSEP)

3 units (Williamson) given 2001-02

201B. Education for Liberation—Focusing on African Americans, investigates how education has been employed to advance group self-determination and autonomy from the 1954 Brown decision to contemporary Afro-centric/African-centered educational initiatives. (SSSEP)

3 units (Williamson) given 2001-02

202. Introduction to Comparative and International Education—Introduction to the field of comparative and international education. Contemporary theoretical debates about educational change and development, and the international dimension of several contemporary issues in education. Emphasis is on the development of students’ abilities to
make cross-national and historical comparisons of educational phenomena. (SSPEP/ICE)
  4-5 units, Aut (Mundy)

202I. Education Policy Workshop in International and Comparative Education—Project-based workshop for students in International and Comparative Education, providing a practical introduction to key issues in educational policy making, educational planning, implementation, and the role of foreign expertise/consultants in developing country contexts. (SSPEP/ICE)
  2-3 units, Aut (McDermott)

203X. Education and Inequality in American Culture—Overview of the cultural production of inequalities in school performance by class, race, ethnicity, gender, and individual style. Students exploring the same themes in small group discussions enroll in 220Y for additional 2 units.
  2 units, Aut (Mundy)

203Y. Discussion: Education and Inequality in American Culture—Small group discussions of competition and unequal access in notable American texts. Corequisite: 203X.
  2 units, Aut (McDermott)

204. Introduction to Philosophy of Education—Introduces current approaches and techniques in the philosophy of education; material has been selected for its general relevance to students of education. Feminist and radical theories of education. Introductory philosophical material is presented in the context of educational issues. (SSPEP)
  3 units, Aut (Callan)

205. Group Counseling—Develops the ability to identify and understand the interpersonal processes in a small group. First-hand experiences simulate group processes that can be examined and conceptualized. Prerequisite: consent of instructor.
  1-4 units (Staff) not given 2000-01

206A. Applied Research Methods in International and Comparative Education I: Introduction—Required for all A.M. students in ICE and IEAPA, others by consent of instructor. Orientation to the A.M. program and research project, exploration of resources for study and research. (SSPEP/ICE)
  1 unit, Aut (Rhoten)

206B. Applied Research Methods in International and Comparative Education II: The Master's Monograph Proposal—Required for all A.M. students in ICE and IEAPA; others by consent of instructor. Development of research skills through discussion of theoretical and methodological issues in comparative and international education. Preparation of a research proposal for the A.M. monograph. (SSPEP/ICE)
  3-5 units, Win (Rhoten)

206C. Applied Research Methods in International and Comparative Education III: Master's Monograph Workshop—The conclusion of the four-quarter A.M. program in ICE and IEAPA, required of all A.M. students. In-depth reviews of students' research in preparation for the completion of their master's monograph. (SSPEP/ICE)
  3-5 units, Sum (Rhoten)

208B. Curriculum Construction—The theories and methods of curriculum development and improvement. Topics: curriculum ideologies, perspectives on design, strategies for diverse learners, and the politics of curriculum construction and implementation. Students develop curriculum plans for use in real settings. (CTE)
  3 units, Win (Pope)

209X. The Politics of Language Education in California Schools—(Same as 109X.)
  3-4 units, Win (Baugh)

210. Problems in Sociology of Education—(Meets with 310; same as Sociology 232/230.) Introduction to sociological approaches to educational phenomena. Topics: school organization and environment, the relationship of education to adult roles, the impact of social class and ethnicity on classroom learning, and the social structure of the classroom. Read/evaluate social sciences research. Short written assignments and individual feedback. (SSPEP)
  4 units, Spr (McFarland)

211. Master's Seminar in Social Sciences in Education—Limited to master's students in SSE. Directed, hands-on forum for SSE students to critically examine the process of developing and shaping a research program, integrating it with academic and field experiences, and building relationships beyond the program. Students conceptualize their projects and focus on researchable topics: effective revising and editing, job searches, working with your adviser, "what next?," or a celebration of achievements so far. (SSPEP)
  1 unit, Aut, Win, Spr (Christopher)

213. Aesthetic Foundations of Education—What role might the arts play in education? Do the arts contribute to the development of cognitive skills? Do they help humans understand the world in which they live? Are aesthetic considerations central in the way we think about the aims of education? Do they enhance teaching and school organization? (CTE)
  4 units, Aut (Ross)

214. Popper, Kuhn, and Lakatos—(Same as Philosophy 156.) Popper, Kuhn, and Lakatos are 20th-century philosophers of science who have raised fundamental issues dealing with the nature of scientific progress: the rationality of change of scientific belief—science vs. non-science; the role of induction in science, truth, or verisimilitude as regulative ideals. Their impact in the social sciences and applied areas such as educational research. (SSPEP)
  3 units, Spr (Phillips)

219. Artistic Development of the Child—How can children's and adolescents' development in the arts be described? What role does the symbolic transformation of experience play in the creation of those images we regard as art? What can teachers do to promote the development of artistic thinking? These and other questions are examined through the study of theory and research conducted within the social sciences. (CTE)
  4 units (Eisner) not given 2000-01

220A,B,C,D,Y. The Social Sciences and Educational Analysis—Required of students in APA and open to all. Economics, political science, sociology, and history, and their applications to education in the U.S.

220A. The Social Sciences and Educational Analysis: Introduction to the Economics of Education—Overview of the relationship between education and economic analysis. Topics: labor markets for teachers, the economics of child care, the effects of education on earnings and employment, the effects of education on economic growth and distribution of income, and the financing of education. Students who lack training in micro-economics enroll in 220Y for one additional unit of credit. (SSPEP/APA)
  4 units, Win (Loeb)

220B. Introduction to the Politics of Education—The relationships between political analysis and policy formulation in education; focus is on alternative models of the political process, the nature of interest groups, political strategies, community power, the external environment of organizations, and the implementations of policy. Applications to policy analysis, implementation, and politics of reform are emphasized. Prerequisite: Political Science or Public Policy major, or student in SSPEP. (SSPEP/APA)
  4 units, Spr (Kirst)

220C. Education and Society—(Same as Sociology 130.) The effects of schools and schooling on individuals, the stratification system, and
society. Education as socializing individuals and as legitimizing social institutions. The social and individual factors affecting the expansion of schooling, individual educational attainment, and the organizational structure of schooling. (SSPEP/APA) GER: 3b (DR:9)

5 units, Win (Meyer)

220D. History of School Reform: Origins, Policies, Outcomes, and Explanations—Restricted to graduate students and undergraduates planning to work on honors theses in education or in directly related areas. Focus is on school reform in the U.S. during the last 50 years. Reform and practice in other nations for comparative purposes. Topics: theories of reform; school choice; academic standards and systemic reform; civil rights issues including racial and social integration, and the education of limited English speaking students; governance approaches; and the implementation of reform. Why and how some school reforms persist, why some fail or fade, and why some recur periodically. Students investigate a particular reform: its sources, policy development and implementation, and the consequences, intended and unintended, using one or more of the analytic frameworks presented. (SSPEP/APA)

4 units, Aut (Smith)

220Y. Introduction to the Economics of Education: Economics Section—Introduction to micro-economics for those taking 220A who have not had micro-economics before or who need a refresher. Corequisite: 220A. (SSPEP/APA)

1-2 units, Win (Loeb)

221A. Policy Analysis in Education—Major concepts associated with the development, enactment, and execution of social policy. Issues of policy implementation, agenda setting and problem formulation, coalition politics, and intergovernmental relations are examined through case materials and supplementary readings. Objective: identify and understand the factors that affect the ways in which analysts and policymakers learn about the policy system and the ways in which they can influence it. Enrollment limited. Prerequisite: consent of instructor. (SSPEP/APA)

4-5 units, Win (McLaughlin, Darling-Hammond)

221B. Macro and Micro Issues in Policy Analysis—Provides doctoral students an opportunity to analyze the macro- and micro-dimensions of policy issues in education. Students use their own research interests to explore the analytical, empirical, and methodological aspects of these two different perspectives on policy and action.

3 units, Win (McLaughlin, Darling-Hammond)

222. Resource Allocation in Education—Problems of optimization and design, and evaluation of decision experience. Marginal analysis, educational production functions, cost effectiveness and cost-benefit analysis, constrained maximization, program evaluation. Introduction to linear models for large-scale data analysis. Implications to model assumptions. (SSPEP/APA)

4-5 units (Loeb) not given 2000-01

223. Good Schools: Research, Policy, and Practice—Recent studies of schools that exceed expectations in producing desired results. Research methodologies, findings of studies, and efforts to implement results. Components of "good" schools analyzed: effective teaching, principal leadership, organizational processes, parent involvement, cultures in schools, the role of the superintendent. Required project studies a school and determines "goodness." (SSPEP/APA, CTE)

3-4 units, Aut (Cuban)

224. Information Technology in the Classroom—The use of information technology (computers, interactive video, telecommunications) in classroom teaching. Basic computer operations and terminology; challenges of planning and teaching with technology; judging the merits of products for educational uses; survey of the types of uses made of technology in schools; and economic, social, and ethical issues, emphasizing equity. (CTE)

3 units, Win (Walker)

226. Classroom Assessment—Research on classroom testing; creating and selecting classroom tests; instructional uses of tests, performance tests, classroom observations, linking testing and instruction, using standardized test results. (PSE)

3 units (Haertel) not given 2000-01

228. Research on Reading and Reading Acquisition—For doctoral and master's students in SSPEP, PSE, CTE, and SSPEP. Focus is on the application of psychological principles in understanding the reading and writing process and the acquisition of literacy in school and non-school settings. Key concepts: psycholinguistics, perception and cognition, motivation, and individual differences. (SSPEP)

3-4 units (Kamil) not given 2000-01

229A,B,C,D. Seminar in Learning Design and Technology—Four-quarter core of the LDT master's program. Topics: learning, cognition, and development; design principles for technological learning environments; technological literacy and skills; research methods and evaluation; curriculum and content; and organization structure and operation. Students navigate one or more design sequences in learning environments rooted in a practical problem. Topics in learning, design, and technology are examined from a theoretical and a practical application perspective. Readings and hands-on development are a team-collaborative effort. (All Areas)

229A. 3 units, Sum (Walker)

229B. 3 units, Aut (Walker)

229C. 3 units, Win (Kamil)

229D. 3 units, Spr (Barron, Greeno)

230. Ethnographic and Empowerment Evaluation—The role of ethnography in addressing contemporary and socially significant issues. The value of ethnographic evaluation in educational settings. Successful strategies to effectively communicate qualitative findings with powerful policymaking bodies to improve our world, including testifying on the hill and sharing findings through the media. The role of ethnographic and empowerment evaluation in contributing to organizational transformation. (SSPEP)

5 units, Spr (Fetterman)

231X. Developing and Supporting Teaching—How do teachers learn to teach and what kinds of mentoring and coaching support helps them to develop their practice? Teaching requires the ability to make hundreds of choices and decisions daily. A strong knowledge base and skills of reflective inquiry increase the odds that all students are served in each teacher's classroom. How is the development of successful teaching supported? What does effective mentoring look like? What are some of the dilemmas and difficulties faced by mentors? The research on adult learning and learning to teach. Skills such as giving productive feedback and co-planning. Methods such as teaching videos, role-plays, reading and discussion of theory, research, and practice concerning mentoring.

3 units, Spr (Darling-Hammond)

232A. Teaching: Questions for Practice, Research, and Policy—How do we define and study teaching? What do teachers need to know, believe, and be able to do? How does teaching vary by subject matter, students, grade level? What is the relationship between teaching and learning? How do teachers learn? The research that has tackled these questions provides students with the chance to think about these and other questions of their own. (CTE)

4 units, Win (Boaler, Grossman)

232B. Introduction to Curriculum—Second of CTE core. What should American schools teach? How should school programs be organized? How can schools determine whether the goals they have formulated have been achieved? What kind of school organization helps teachers improve their teaching practices? Students secure a historical and contemporary perspective on the curriculum of American schools. The interactions among curriculum, the organizational structure of schools, the concep-
tion of the teacher's role, and the ways in which teaching and student learning are assessed. Text, video analysis of teaching, and small group discussions examine competing ideas regarding the content and aims of school programs. (CTE)

4 units, Aut (Atkin, Kiely)

232C. Introduction to Learning—Core course in CTE and PSE. The theoretical perspectives and results of research on learning, emphasizing principles that can inform the design and study of learning environments, including teaching and curriculum activities and resources. Issues: the ways of assessing learning, learning by individuals and groups who differ in gender or in cultural and social backgrounds, the generality of learning outcomes, relations between the growth of conceptual understanding and cognitive skill, learning considered as becoming a more effective participant in social practices, and a brief history of the development of currently influential conceptualizations of learning. (CTE, PSE)

4 units, Spr (Ball, Greeno, Hakuta)

233A. Counseling Theories and Interventions from a Multicultural Perspective—Review of foundational and new concepts of counseling theory and intervention from a multicultural perspective. The impact of culture on clinical presentation, relationship formation, and intervention development and evaluation in individual and group counseling. (PSE)

3 units (LaFromboise) not given 2000-01

233B. Counseling Theories and Interventions from a Multicultural Perspective, Part B—Alternative roles for multicultural counselors build on the foundational skills of individual and group counseling in 233A: adviser, advocate, facilitator of indigenous support systems, facilitator of indigenous healing systems, consultant, change agent, and counselor roles and functions in light of the client’s level of acculturation, locus of problem etiology, and goals of helping.

3 units (LaFromboise) not given 2000-01

234. Career and Personal Counseling in Culturally Diverse Settings—(Same as Psychology 237.) Methods of integrating career and personal counseling with clients and counselors from differing backgrounds. Practice with selected assessment instruments. Case studies of bicultural role conflict. Informal supervised experience. (PSE)

3 units (Krumboltz) not given 2000-01

235. Educational Policy Graduate Seminar—Enrollment limited to policy analysis and evaluation master's students. Three-quarter sequence to explore and discuss policy issues, develop educational technology skills, and prepare for employment. (SSEP/APA)

1 unit, Aut, Win, Spr (Fetterman)

236X. Education Technology Policy—Issues in education technology policy in the U.S. and selected other advanced and developing nations for K-12 and post-secondary education. Governmental policies at all levels and policies of local public and private institutions. Policy development and implementation focusing on the incentives for the private sector to become involved in education and in the consequences of the policies for low income populations. (SSEP)

3 units, Spr (Smith, Carnoy)

238A. Orientation to Counseling Psychology—For first-year counseling psychology students. Overview of the counseling psychology profession, including counseling theories, techniques, and assessment. Topics: relationship enhancement, problem conceptualization, goal setting, intervention techniques, and monitoring outcomes. Review of training tapes, role-playing, and supervision of initial counseling experiences. Prerequisite: consent of instructor. (PSE)

3 units (Krumboltz, LaFromboise) not given 2000-01

238B. Counseling and Health Psychology: Supervised Applications—For first-year counseling psychology students. Integration of counseling practice with research findings. Continuing review of training tapes, role-playing, and supervision of counseling experiences. Prerequisite: consent of instructor. (PSE)

3 units (Krumboltz, LaFromboise) not given 2000-01

238C. Counseling and Health Psychology: Supervised Applications—For first-year counseling psychology students. Advanced study of counseling theories, techniques, and assessment methods. Emphasis is on the integration of counseling practice within a research framework. Continuing review of training tapes, role-playing, and supervision of counseling experiences. Prerequisite: consent of instructor. (PSE)

3 units (Krumboltz, LaFromboise) not given 2000-01

239. Contemporary Social Issues in Child and Adolescent Development—Focuses on critical social and developmental issues that affect children and adolescents. Topics: divorce and single parenting, child care, poverty, sexuality, and mass media, emphasizing the impact of these conditions on normal development, education, and school-related social and cognitive performance. (PSE)

4 units, Spr (Padilla)

240. Adolescent Development and Learning—Two presuppositions: that fruitful instruction takes into account the developmental characteristics of learners and the task demands and structure of specific curricula; and that teachers can promote learning and motivation by mediating between the characteristics of students and of the curriculum and the wider social context of the classroom. The strategies and issues involved in this mediational process with secondary students. Prerequisite: STEP student or consent of instructor. (STEP)

3 units, Aut (Roeser, Padilla)

241. Race, Education, and the Media—(Same as 141.) In-depth overview of the critical issues and policies that impact race relations and education in our society. Lectures, readings, discussions on the debates on affirmative action, merit, racial inequality, improving educational quality, and how these issues are shaped by a rapidly changing media industry.

5 units (Carnoy, Steyer) not given 2000-01

243. Research in Writing and Writing Instruction—Tradition and change in writing research, emphasizing theoretical and pedagogical implications. Topics: formalist, cognitive, and social-contextual approaches; writing and learning; writing/reading connections; writing/speaking connections; the composing process; writing pedagogy; individual research projects. (SSEP, CTE)

4 units (Ball) not given 2000-01

244X. Classroom Management—Beginning and experienced teachers are concerned with how to best manage their classroom. Different strategies are placed within a theoretical framework. The approaches that could be employed when managing classrooms, and student behavior in particular.

1 unit, Aut, Win (Haysman)

245X. Seminar in Teacher Education—For doctoral students interested in preparing to become teacher educators or who have interests in policy issues related to teacher education. Directed reading, discussion, and analysis of teacher education program models; new approaches to support teacher learning in the pre-service and in-service contexts; and changes in policies relevant to teacher education. The theoretical frames include adult learning theory, organizational supports for professional learning, and issues of institutional change.

3 units (Darling-Hammond) not given 2000-01

246A,B,C,D. Secondary School Teaching Practicum—Preparation and practice in issues and strategies for teaching in classrooms with diverse students. Topics: instruction, curricular planning, classroom interaction processes, portfolio development, teacher professionalism, patterns of school organization, teaching contexts, and government educational policy. Classroom observation and student teaching with
accompanying seminars during each quarter of STEP year. 16 units required for completion of the program. Prerequisite: STEP student. (STEP)

246A. 2 units, Sum (Lotan)
246B. 1-4 units, Aut (Lotan)
246C. 7-10 units, Win (Lotan)
246D. 3 units, Spr (Lotan)

247. Moral Education—Issues in moral theory and education, including consideration of the Kohlberg-Gilligan debate, character education, and contemporary issues on values and religious education. (SSPEP)
3 units, Win (Damon)

249. Theory and Issues in the Study of Bilingualism—For graduate students. Key issues in the study of bilingualism from a sociolinguistic perspective. Emphasis is on typologies of bilingualism, the acquisition of bilingual ability, the description and measurement of bilingualism, and the nature of societal bilingualism. Prepares students to work with bilingual students and their families and to carry out research in bilingual settings. (SSPEP)
3 units, Win (Damon)

250A. Statistical Analysis in Educational Research—Primarily for doctoral students. Regression and categorical models are widely used data-analytic procedures. Topics: basic regression including multiple and curvilinear regression, regression diagnostics, analysis of residuals and model selection, logistic regression, analysis of categorical data. Proficiency with statistical computer packages. Prerequisite: 160 or equivalent. (All Areas)
4 units, Win (Loeb)

250B. Statistical Analysis in Educational Research: Analysis of Variance—Sequence, primarily for doctoral students. Analysis of variance models are among the most widely used data analytic procedures, especially in experimental, quasi-experimental, and criterion-group designs. Topics: single-factor ANOVA, the factorial between and within subjects and mixed design ANOVA (fixed, random, and mixed models), analysis of covariance, multiple comparison procedures. Prerequisite: 160X or equivalent. (All Areas)
4 units, Spr (Ruiz-Primo)

4 units, Aut (Ruiz-Primo)

252. Introduction to Test Theory—Concepts of reliability and validity; derivation and use of test scales and norms; mathematical models and procedures for test validation, scoring, and interpretation. Prerequisite: Statistics 190 or equivalent. (PSE)
3-4 units (Haertel) not given 2000-01

253X. The Principalship: Theory and Practice—For those interested in leadership roles in K-12 education, or for those interested in the theory and practice of school administration. Seminar immerses students in a broad study focused on conceptions of the role of the school principal.
4 units, Spr (Copland)

257A,B. Statistical Methods for Behavioral and Social Sciences—For students with experience and training in empirical research. Analysis of data from experimental studies through factorial designs, randomized blocks, repeated measures; regression methods through multiple regression, model building, analysis of covariance; categorical data analysis through log-linear models, logistic regression. Integrated with the use of statistical computing packages. Prerequisite: analysis of variance and regression at the level of Statistics 161.
257A. 3 units, Win (Rogosa)
257B. 3 units, Spr (Rogosa)

260X. Popular Advanced Statistical Methods—Overview and implementation of some advanced statistical methods currently popular in educational research. Methods for accommodating the nested structure of much educational data (e.g., students within classrooms within schools) which arise as units of analysis problems, ecological regression, or hierarchical linear models. Methods for complex measurement models in regression settings known as structural equation models, causal models, covariance structures. See http://www.stanford.edu/class/ed 260.
3 units (Rogosa) not given 2000-01

261X. Critical Reading in the Content Areas—Topics: introduction to models of reading, functions of literacy, components of reading instruction, content vs. recreational reading, literacy vs. expository materials, and reading to learn vs. learning to read; text types; testing and assessment; vocabulary and reading instruction; comprehension and background knowledge; study skills and aids; metacognition; strategies; writing and reading instruction; technological applications; affective concerns and motivations. (SSPEP)
3 units, Spr (Kamil)

262A,B,C. Curriculum and Instruction in English—Approaches to teaching English in the secondary school, including goals for instruction, teaching techniques, and methods of evaluation
262A. 3 units, Sum (Grossman)
262B. 2 units, Aut (Grossman, Vosovic)
262C. 2 units, Win (Grossman, Vosovic)

263A,B,C. Curriculum and Instruction in Mathematics—The purposes and programs of mathematics in the secondary curriculum; teaching materials, methods. Prerequisite: STEP student or consent of instructor. (STEP)
263A. 3 units, Sum (Boaler)
263B. 2 units, Aut (Boaler)
263C. 2 units, Win (Boaler)

264A,B,C. Curriculum and Instruction in Foreign Languages—Approaches to teaching foreign languages in the secondary school, including goals for instruction, teaching techniques, and methods of evaluation. Prerequisite: STEP student. (STEP)
264A. 3 unit, Sum (Azevedo)
264B. 2 unit, Aut (Azevedo)
264C. 2 units, Win (Azevedo)

265X. History of Higher Education in the U.S.—See 165X.
3-5 units, Win (Rothblatt)

267A,B,C. Curriculum and Instruction in Science—Examination of the possible objectives of secondary science teaching and related methods: selection and organization of content and instructional materials; lab and demonstration techniques; evaluation, tests; curricular changes; ties with other subject areas. Prerequisite: STEP student or consent of instructor. (STEP)
267A. 3 unit, Sum (Atkin)
267B. 2 unit, Aut (Schultz)
267C. 2 units, Win (Schultz)

268A,B,C. Curriculum and Instruction in Social Studies—Emphasis is on the methodology of social studies instruction: review of curriculum trends, survey of teaching materials, opportunities to develop teaching and resource units. Prerequisite: STEP student.
268A. 3 unit, Sum (Cuban)
269. Principles of Learning for Teaching—Student learning and the epistemology of school subjects as they relate to the planning and implementation of teaching, the analysis of curriculum, and the evaluation of performance and understanding. Readings and activities are coordinated with internship and the student teaching activities of participants. Prerequisite: STEP student or consent of instructor.

3 units, Win (Darling-Hammond, Greeno)

275. African-American English in Educational Context—The linguistic and cultural conflicts confronting the majority of African-American students. Interdisciplinary research, emphasizing cross-generation-al educational needs. Ethnographic studies of schools and their students, and the evolution of educational and linguistic research among African Americans. Prerequisite: graduate student, or consent of instructor. (SSPEP)

3 units (Baugh) not given 2000-01

277X. Education of Immigrant Students: Psychological Perspectives—For graduate students; see 177X.

4 units, Win (Padilla)

278. Introduction to Issues in Evaluation—Focus is on the basic literature and major theoretical and practical issues facing the evaluation field. Topics: evaluation as a branch of experimental science, models of evaluation, quantitative and qualitative approaches to evaluation, evaluation as related to decision-making and the political process, and professional standards of evaluation. (SSPEP)

3 units, Win (Porteous)

279. Urban Youth and their Institutions: Research and Practice—For graduate students; see 179X. Enrollment limited, consent of instructor required. (SSPEP/APA)

3-4 units, Aut (McLaughlin)

280. Ethnographic Approaches to Cultural Diversity in Schooling—(Same as Cultural and Social Anthropology 280.) How to learn about culture and to analyze education-relevant situations such as the culturally diverse classroom. The cultural process is approached by acquiring techniques of observation, interview, and interpretation of behavior in context, and soliciting and recording the "native" explanations of their own behavior; developing an internally consistent conceptual structure that orients observation and elicitation productively; and being sensitized to one's own culture and how it influences perception and interpretation of behavior. Techniques of ethnographic research applicable to the study of schooling are demonstrated and applied in field research projects. Research report or proposal for research. (SSPEP)

4 units, Win (Spindler)

282. Linguistics and the Teaching of English as a Second/Foreign Language—Enroll in Linguistics 189/289.) (SSPEP)

4-5 units, Win (Hubbard)

283. Attitudes toward Languages and Language Study—With language viewed as an intergroup phenomenon, examines attitudes people hold toward their own and different languages, the bias toward and against speakers of different languages, how personal and societal attitudes affect the study and learning of a foreign or second language. A socio-psychological perspective is used as a central framework to guide the study of attitudes toward language. (SSPEP)

3 units (Padilla) not given 2000-01

284. Teaching in Heterogeneous Classrooms—Teaching in academically and linguistically heterogeneous classrooms requires a repertoire of pedagogical strategies. Focus is on the ways to provide access to intellectually challenging curriculum and equal-status interaction for students in diverse classrooms. Emphasis is on groupwork, a highly recommended and documented instructional approach, and its cognitive, social, and linguistic benefits for students. How to prepare students for groupwork, equalize participation, design learning tasks that support conceptual understanding, mastery of content and language growth, and assess group products and individual contributions. (STEP)

3-4 units, Win (Gallagher-Thompson, Moffett)

286A. Second Language Acquisition—For students interested in teaching English as second/foreign language. Second language learning and teaching. Serves as basis of second language pedagogy, preparing STEP students for CLAD certification. (SSPEP, STEP)

4 units (Staff) not given 2000-01

286B. Second Language Acquisition Research—Major research findings and theories in second language acquisition. Second language research and theories in formal and informal settings where a second language is learned. (SSPEP)

4 units (Padilla) not given 2000-01

287. Culture and Learning—(Same as Cultural and Social Anthropology 158.) Learning in various institutional settings in the U.S. and around the globe. Learning in families, in schools, on the job, and on the streets. Emphasis is on the cultural organization of success and failure in American schools. Tentative consideration of opportunities for making less inequality. (SSPEP, STEP)

3-4 units, Win (McDermott)

289. Introduction to Linguistics for Educational Researchers—For graduate students with interests in educational research, and who plan to concentrate on language or linguistics. Basic linguistic concepts, complementary surveys of educationally oriented studies that explore quantitative linguistic analyses, qualitative ethno-linguistic analyses, discourse analyses, conversation analyses, and studies of bilingualism. Emphasis is on the linguistic analyses of language minority populations and related educational policies.

4 units, Aut (Baugh)

290. Leadership: Research, Policy, and Practice—Conceptions of leadership that include the classroom, school, district office, and state capitol. The role of complexity; organizational leaders outside of schools past and present, and how that complexity permitted leadership to arise. Case studies. (SSPEP/APA)

3-4 units (Cuban) not given 2000-01

295. Learning and Cognition in Activity—(Same as Psychology 261.) Introduction to the results and methods of research on learning, understanding, reasoning, problem solving, and remembering, considered as aspects of participation in social organized activity. Analyses focus is on the principles of coordination that support cognitive achievements and learning in activity settings in work and school environments.

3 units, Spr (Greeno)

296. Substance Dependence: Assessment, Treatment, and Prevention—Offered at the Menlo Park division of the VA Palo Alto Health Care System; open to graduate students in the social sciences. Survey of prevalence, etiology, and treatment of alcohol and drug-related disorders. Focus is on a developmental perspective and how substance abuse disorders manifest themselves in men and women at different ages from childhood through late adulthood. Various treatment approaches that have been beneficial, e.g., AA, individual and group work, family treatment, and inpatient vs. outpatient care. Required visit to relevant treatment programs during the quarter. (PSE)

3 units, Win (Gallagher-Thompson, Moffett)

tion and critique of research methods including classroom observation, interaction analysis, classroom ethnography, interviews and questionnaires, elicitation techniques, and case studies. Individual projects utilize data gathered in second language classrooms. (SSPEP)

3 units (Valdés) not given 2000-01

301. Historiography of American Education—(Same as History 301.) Analysis of the literature of American education history for students doing further work in the field. Weekly colloquium discussions, plus an opportunity to pursue specialized topics in small group tutorial sessions. Limited enrollment. Prerequisite: consent of instructor. (SSPEP)

3-4 units (Williamson) given 2001-02

302X. The Role of Knowledge and Learning in Teaching—Focus is on current literature relevant to the subject of teaching. Classroom life, and to the cognitive processes involved as students try to learn material. The implications of the literature on the role of the teacher. (CTE)

3 units (Staff) not given 2000-01

303. Qualitative Inquiry in Education—The ways in which artistically and humanistically based approaches to the study of teaching, classroom life, and schooling can improve the understanding of education. Introduces qualitative methods of inquiry that emphasize literary and other interpretive forms, and new approaches to inquiry in education. A study using methods. (CTE)

4 units, Sum (Eisner)

304. The Philosophical and Educational Thought of John Dewey—Analysis of important works of John Dewey. Readings vary each year. Emphasis may be on his social and moral writings. (SSPEP)

4 units, Aut (Staff)

5 units, Win (Carnoy)

306B. The Politics of International Cooperation in Education—(Same as 107.) Analysis of policies and practices in international cooperation, assistance, and exchange. Emphasis is on the role of international organizations (World Bank, UNESCO, OECD) and the politics of multilateral and bilateral assistance programs. (SSPEP/ICE, APA)

3-4 units, Spr (Mundy)

306C. Culture and Technology—(Same as Cultural and Social Anthropology 285.) Technologies and the ways of learning in specific cultural and social environments. Anthropological perspectives on the rise of information technologies and their relation to 20th-century systems of measurement, modes of thought, and forms of hegemony. Topics: accounting systems, metal, paper, plastic, and electronic currencies, writing systems and literacy, and computerized learning environments. (SSPEP/ICE)

4 units, Spr (McDermott)

306D. World, Societal, and Educational Change: Comparative Perspectives—(Same as Sociology 231.) Analysis of the relations between educational and societal developments from a comparative perspective. Readings on various theoretical perspectives and empirical studies on the structural and cultural sources of educational expansion and differentiation, and on the cultural and structural consequences of educational institutionalization. Research topics: education and nation-building; education, mobility, and equality; education, international organizations, and world culture. (SSPEP/ICE)

4-5 units, Aut (Ramirez)

308. The Analysis of Teaching—Teaching is often considered an art or craft rather than a science. Is this true? Do teachers function as performers? Videotapes of teachers in action serve as a resource for the analysis of teaching. Concepts and methods from the field of criticism provide tools to analyze teaching. Literature in criticism, aesthetics, and qualitative evaluation secures the conceptual tools for the analysis of teaching. (CTE)

4 units (Eisner) not given 2000-01

310. Problems in Sociology of Education—For doctoral and master's students. Meets with 210. Emphasis is on conceptualizing and analyzing applied sociological research in education. Short written assignments, individual feedback, and work with actual research data. (SSPEP)

4 units, Spr (McFarland)

311X. First-Year Doctoral Seminar: Introduction to Research—Introduction to the broad range of methods used in current educational research, focusing on the logical and epistemological, design, and ethical issues. (All Areas)

1-2 units, Aut (Phillips)

Spr (Phillips, Stipek)

312. Interaction Processes in Education—The educational applications of sociological/social psychological theory and research to interaction processes within schools and classrooms. Readings in foundational works by Mead, Schutz, Simmel, and more contemporary works in sociology and education, spanning a variety of empirical settings beyond classrooms, e.g., primate societies, children's games, and work settings. Topics: social processes of influence, role differentiation, identity formation, social mechanisms, and intra/inter-group dynamics of peer relations. Methods for observation and analysis. (SSPEP)

4 units, Aut (McFarland)

313X. Mathematics, Equity, and Situated Learning—The ways in which mathematics intersects with people's lives, the reasons why it is practiced only by the elite few and the potential of situated perspectives for the attainment of equitable practices. Drawing on theories of learning, curriculum, equity, and schooling, students research these and related issues.

3 units (Boaler) not given 2000-01

314. Workshop in Economics of Education—Research by students and faculty engaged in problems in the economics of education. Students must have advanced graduate training in economics theory and methodology and be engaged in research on the topic. (SSPEP)

1-2 units, Aut, Win, Spr (Carnoy)

315X. Vouchers and Choice in Education—The theory and empirical data on issues of educational choice and vouchers in the U.S., Europe, and other countries. Recommended: background in economics. (SSPEP)

3 units (Carnoy) not given 2000-01

316X. Network Methods for the Study of Formal and Informal Organizations—The educational applications of social network analysis. Introduction to social network theory, methods, and research applications in sociology. Network concepts of interactionist (e.g., balance, cohesion, centrality) and structuralist (e.g., structural equivalence, roles, duality) traditions are defined and applied to topics in small groups, social movements, organizations, communities, etc. Students apply these techniques to data on schools and classrooms (i.e., data provided by instructor). (SSPEP)

3 units, Win (McFarland)

321B. Analysis of Social Interaction—Practicum on discourse, interactional, and cultural analysis of videotaped data. Various levels of analysis of interactional data, and the basis on which analytic claims can be founded. The transcription of speech and movement in social interaction, and how to identify the patterns which participants use to display and interpret cultural meanings. The theoretical assumptions hidden in
transcription systems. Prerequisite: first- or second-year graduate student. (SSPEP/ICE)
4 units, Aut (McDermott)

322X. Discourse Analysis in Educational Research—Issues and strategies for studying oral and written discourse as a means for understanding classrooms, students, and teachers, and teaching and learning in the context of school. The forms and functions of oral and written language in the classroom, emphasizing teacher-student and peer interaction, and student-produced texts. Individual projects utilize discourse analytic techniques. Prerequisite: graduate status or consent of instructor. (SSPEP)
3 units (Ball) not given 2000-01

3 units, Aut (Kirst)

324X. Emerging Business Opportunities in Education and Training—(Same as Business 345G.) For students in the joint degree program with business and education, and others. A combination of changing market mechanisms and emerging technologies is fueling new opportunities for for-profit education and training organizations. The interaction of firms with the public sector presents special challenges for these organizations. The special roles of public administrators, educators, investors, and technology providers in defining opportunities, challenges, and constraints for education and training firms. Approaches to strategy formation, product development, and operations. Visiting managers and other experts. (SSPEP/APA)
2-4 units, Spr (Kirst)

327A, B, C. The Conduct of Qualitative Inquiry—Integrated, three quarters for doctoral students ready to engage in serious pursuit of research that anticipates, is a pilot study for, or in some significant way feeds into their dissertations. It is not necessary that students have written and received approval for their dissertation study. The experience mirrors most of what any research project entails, and is about the actual conduct of research. All students engage in common research processes from September to June including developing interview questions; interviewing; coding/analyzing, interpreting data; theorizing; and writing up results. Participant-observation as needed. Students should consider this a sequence, with the division into quarters as arbitrary. Preference to students who intend to enroll for all three quarters.
327A. 4 units, Aut (Peshkin)
327B. 4 units, Win (Peshkin)
327C. 4 units, Spr (Peshkin)

331A, B. Administration and Policy Analysis Research Seminar—Limited to first-year APA doctoral students. Introduces the rudiments of problem statements, conceptual frameworks, research design, and critical reviews of literature. (SSPEP/APA)
331A. 3 units, Win (Copland, Antonio)
331B. 3 units, Spr (Copland, Antonio)

333A. Advanced Seminar in Learning Design and Technology: Analyzing Functions and Needs in Learning Environments—Introduction to the theoretical approaches to learning used to analyze learning environments and develop goals for designing resources and activities to support more effective learning practices.
3 units, Sum (Greene)

333B. Advanced Seminar in Learning Design and Technology: Organizations—How organizational resources, structures, constraints, and possibilities are taken into account in research-based designs for learning in schools and workplaces. Presentations and discussions by researchers from the Institute for Research on Learning offer an overview of current research and development efforts for improving learning in schools and workplaces.
3 units, Win (Goldman)

333C. Advanced Seminar in Learning Design and Technology: Social and Ethical Issues—Readings/discussions, case studies, and internships on the ethical and social issues related to learning and technology. Prerequisite: enrollment in LDT, or consent of instructor.
3 units (Kamil) not given 2000-01

335X. Language Policy and Planning: National and International Perspectives—For graduate students and undergraduates, with consent of instructor. International study of the social, political, and educational tensions that shape language policy. Emphasis is on language education that affects immigrants, guest workers, and indigenous linguistic minority populations; policies that determine foreign language instruction, and U.S. language policies in a comparative approach. (SSPEP)
3 units, Spr (Valdés)

338A, B, C. Practicum in Counseling and Health Psychology—For Counseling Psychology majors only. Intensive supervised field experience in local schools or social agencies. (PSE)
338A. 1-6 units, Aut (LaFromboise, Krumbolz)
338B. 1-6 units, Win (LaFromboise, Krumbolz)
338C. 1-6 units, Spr (LaFromboise, Krumbolz)

340X. American Indian Mental Health and Education—Western medicine tends to define health by first defining sickness, disease, or pathology, and then defining health as the absence of these diseases. Native American cultures understood health to mean the balance or beauty of all things physical, spiritual, emotional, and social. Sickness was something out of balance, the absence of harmony. Representative topics in American Indian psychology and health acquaint students with issues that characterize the field, its methods, goals, and findings. Prerequisite: experience working with American Indian communities. (PSE)
3 units, Spr (LaFromboise)

341. Educational Applications of Sociolinguistics—For students interested in the broad applications of linguistic research in educational contexts. Formal integration of sociolinguistics and applied linguistic research is examined in relation to a range of international case studies among students and teachers in socially stratified speech communities worldwide. Theoretical concepts from linguistics are introduced as they relate to practical educational problems in socially stratified speech communities. Recommended: background in linguistic science for students who seek an introduction to applied linguistic research. (SSPEP)
3 units, Win (Baugh)

343X. Achievement Motivation in School-Aged Children—Surveys developments in the study of achievement motivation in children and adolescents over the past 50 years. The historical and theoretical approaches to understanding the quality, intensity, and direction of children’s achievement-related behavior. Clinical life-span theories, cognitive theories, and social-cognitive theories of achievement motivation. Differences among mechanistic, organismic, and developmental-contextual metamodels of motivation, qualitative vs. quantitative conceptualizations of “motivation,” and the differential emphasis placed upon organismic needs, cognition, volition, and emotion in theories concerned with understanding achievement behavior. (PSE)
3 units (Roeser) not given 2000-01

344X. Child Development and Schooling—School represents a major context of development during childhood in the U.S. How the practices and activities of schooling influence the social, emotional, and cognitive development of children. Meta-theoretical approaches (e.g., mechanistic, organismic, developmental contextualist metamodels) and methods of conducting research on schooling and development (experimental,
345X. Adolescent Development and Schooling—School represents a major context of development during adolescence in the U.S. How the context of school and its relationship to other major context developments (family, peer group, and neighborhood) influence the social, emotional, and cognitive development of secondary school-aged youths. Metatheoretical approaches (e.g., mechanistic, organicism, developmental contextualist metamodels) and methods of conducting research on schooling and development (laboratory, survey, ethnographic, intervention, etc.). Topics: school transitions during adolescence, the role of school functioning in broader patterns of competence or distress, and how the organization of academic tasks, classrooms, and school environments as a whole can influence different aspects of adolescent development. Focuses on the middle and high school years (see also 344X). (PSE)

3 units, Win (Roese)

347X. Economics of Higher Education—Key economic issues in American higher education in the contemporary period. Topics: the "worth" of college and graduate degrees and the utilization of highly educated graduates; faculty labor markets, careers, and workload; costs and pricing; discounting, merit aid and access to higher education; sponsored research, academic medical centers; and technology and productivity. Emphasis is on theoretical frameworks and policy matters, exploring the concept of higher education as a public good. Stratification by gender, race and social class.

4 units, Aut (Antonio)

350A. Psychological Studies in Education—Required of first-year doctoral students in Psychological Studies; others by consent of instructor. Introduction to the doctoral program in Psychological Studies in Education and to faculty and student research. (PSE)

1 unit, Aut (Barron, Padilla)

350B.C.D. Research Practicum in Psychological Studies in Education—Three-quarter sequence provides students in PSE an opportunity to engage in all facets of the research process. Individual projects in a group context provide extensive opportunities for training and feedback concerning specific projects and the general enterprise of psychological research in education. 350B and C are required of first-year students in PSE; 350D is required of second-year students in PSE. Others by consent of instructor. (PSE)

350B. 3 units, Win (Greeno, Krumboltz)
350C. 3 units, Spr (Rogosa, Roese)
350D. 1 unit, Aut, Win, Spr (Hakuta, Roese)

351. Design and Analysis of Longitudinal Research—The analysis of longitudinal data is central to empirical research on learning and development. Topics: growth models, measurement of change, repeated measures design, quasi-experiments, structural regression models, reciprocal effects, analysis of durations including survival analysis. See http://www.stanford.edu/class/ed351/. Prerequisite: statistical training at the level of 257. (PSE)

3 units (Rogosa) not given 2000-01

353A. Problems in Measurement: Item Response Theory—Survey of the alternative mathematical models used in test construction, analysis, and equating. Emphasis is on applications of item response theory (latent trait theory) to measurement problems, including estimation of item parameters and person abilities, test construction and scoring, tailored testing, mastery testing, and detection of item bias. Prerequisites: 252 and 257, or Psychology 248 and 252, or equivalent. (PSE)

3 units (Haertel) not given 2000-01

353C. Problems in Measurement: Generalizability Theory—Theory and application of generalizability theory to the analysis of educational achievement data, including performance assessments. Fundamental concepts, computer programs, and actual applications. (PSE)

3 units (Haertel) not given 2000-01

353D. Problems in Measurement: Standard Setting—Cut scores on achievement tests define categories like "pass" and "fail" or "advanced," "proficient," "basic," and "below basic." The measurement field is divided concerning the validity of some methods used for establishing such cut scores. The substantive and statistical issues in the theory and practice of standard setting: widely used methods, case studies, and critiques. Prerequisites: 160 or Statistics 160, or equivalent; 252 or equivalent.

3 units (Haertel) not given 2000-01

356X. Action Research in Education—Introduction to the theory and practice of action research. Basic concepts and methods. The historical and ideological influences on this form of inquiry by teachers. Participants analyze action research reports and engage in a small-scale action-research project. (CTE)

3 units (Atkin) not given 2000-01

361. The Economics of Gender in Education and Employment—Policy issues concerning higher education, employment, earnings, discrimination, occupational segregation, housework, childcare, affirmative action, comparable worth, and feminist economics. (SSPEP)

3 units (Strober) not given 2000-01

364X. Reading in a Second Language—Examination of the theories and research related to learning to read in a second language in child and adult learning contexts. The similarities and differences between first- and second-language theories and research on learning to read. Applications of research findings to pedagogy. (SSPEP)

3 units (Kamil) not given 2000-01
366X. Trends and Issues in Reading—Current trends and issues in literacy and literacy instruction, providing a framework for work in reading and literacy. Research, theory, and implications for practice in classroom organization, compensatory instruction, comprehension instruction, reading and writing assessment, second language reading, whole language emergent literacy, adult literacy, and technology. (SSPEP)
3 units, Win (Kamil)

367X. Reading Research Syntheses, Policy, and Practice—Examines the national syntheses of reading research beginning with "The Great Debate" (1967) and concluding with the National Reading Panel (2000). These reports are often the basis of recommendations for parents, administrators, and teachers, and have been the foundation of policy for curricular reform. Students engage in a critical examination of these reports, interpretations, and commentaries, comparing the conclusions and recommendations with those derived from the original research upon which they were based.
3 units (Kamil) not given 2000-01

372. Social Processes in Learning and Development—Doctoral seminar on how children's learning and development are influenced by social interactions with parents, peers, teachers, and the larger cultural context. Emphasis is on research that illuminates the social/cognitive processes thought to influence the development of individual thinking: observation and imitation of models, co-construction of meaning and achievement of intersubjectivity, providing and receiving explanations, and socio-cognitive conflict. How the larger social culture influences the behavior of individuals in interaction and how forms of school culture influence children's individual thinking and thinking in collaboration with others.
(PSE)
3 units, Win (Powell)

374A,B. Research Workshop: Commercialization of Knowledge—Research workshop on key factors that shape processes of transferring basic knowledge into commercial development. Topics: the sociology and economics of science, intellectual property and patenting issues, university-industry relations, cross-national differences in knowledge transfer and science/technology policy, and entrepreneurial activity in universities. Students are expected to either have or to develop research projects on these topics.
2-3 units, Aut, Win (Powell)

375A. Seminar on Organization Theory—(Same as Sociology 363A.) For doctoral-level students or equivalent, providing a thorough grounding in the social science literature on organizations. Readings are organized historically, and introduce the major theoretical traditions and debates in organization theory.
5 units, Aut (Powell)

375B. Seminar on Organizations: Theory and Application—(Same as Sociology 363B.) Continuation of Sociology 363A. The current research on organizational change, drawing on institutional, network, and evolutionary perspectives. Focus is on recent empirical studies that analyze organizational/institutional/political change.
5 units, Win (Powell)

376. Education and Theories of the State—Examines the relationship between political system structures and educational change by analyzing theories and interpretations of how political systems function, and the implications of these theories for understanding education. Classical and Marxist interpretations. (SSPEP/ICE)
5 units (Carnoy) not given 2000-01

377X. Comparing Institutional Forms—Public, Private, and Nonprofit—Assesses whether there is growing convergence across sectors. Focus is on education, health care, day care, the arts, social service, and research. (SSPEP)
4 units (Powell) not given 2000-01

378X. Topics in Organizational Adaptation—Research seminar focusing on theoretical ideas about decision making and learning in organizations. (SSPEP)
2-5 units (March) not given 2000-01

380. Supervised Internship
1-15 units, any quarter (Staff)

381. Multicultural Issues in Higher Education—Reviews the primary social, educational, and political issues that have surfaced in American higher education due to the rapid demographic changes occurring since the early 1980s. Research efforts and the policy debates include multicultural communities, the campus racial climate, and student development; affirmative action in college admissions; multiculturalism and the curriculum; and multiculturalism and scholarship.
4 units (Antonio) not given 2000-01

382X. Student Development and the Study of College Impact—Introduces the philosophies, theories, and methods that undergird the bulk of the research in higher education: how college affects students. Student development theories and models of college impact; issues surrounding data collection, national databases, and secondary data analysis.
4 units, Win (Antonio)

383X. Higher Education Research Practicum—Required of first-year doctoral students in higher education. Seminar. Students obtain familiarity with a range of research specializations in the study of higher education.
2 units (Antonio) not given 2000-01

384. Advanced Topics in Higher Education—Preference given to higher education graduate students. In-depth analysis of selected topics in the study of higher education. Topics vary each year among faculty: development, legal issues, curricular change, knowledge production, professional socialization, management of organizational decline, leadership and innovation, authority and power, diversity and equity, interactions with government and industry. Prerequisites: 346, consent of instructor. (SSPEP/APA)
4 units (Gumport) not given 2000-01

385. The American College Student: Implications for Research and Practice—Open to juniors and seniors with consent of instructor. The nature, culture, and development of the American college student. The American college student from a contemporary perspective, focusing on the question of: who goes to college, what kinds of experiences do students have in college, and how are students affected by their experiences in college?
4 units (White) not given 2000-01

386X. Leadership and Administration in Higher Education—For students who wish to gain a greater insight regarding the management of colleges and universities, and the issues faced by those who hold major leadership roles within these institutions. Definitions of leadership and leadership roles within colleges and universities. Leadership models and organizational concepts useful in understanding institutions of higher education through case study analysis of the problems and challenges facing today's higher education administrators.
4 units, Win (White)

387A,B,C. Workshop: Comparative Studies of Educational and Political Systems—(Same as Sociology 311A,B,C.) Analysis of quantitative and longitudinal data on national educational systems and political structures. Prerequisite: consent of instructor. (SSPEP/ICE)
387A. 2-5 units, Aut (Ramirez)
387B. 2-5 units, Win (Meyer)
387C. 2-5 units, Spr (Meyer)
388A,B. Bilingual Education—Research issues of policy and practice, particularly in the U.S., in programs for language minority students. Topics: the history of policy and legislation in bilingual education, theories of second language learning and first language maintenance, research on the effectiveness of bilingual education, and comparative experiences in other societal settings. (SSPEP, STEP)

388A.—Prepares STEP students for CLAD certification.
3.4 units, Spr (Hakuta)

388B.—For SSPEP students.
3 units, Win (Hakuta)

400X. Writing Seminar for Doctoral Students—For doctoral students to improve scholarly writing; an experience in the process of revision. Topics: the power of lead sentences, strong verbs, telling titles, organization, proper conclusions, and as needed, the quotidian matters of spelling, grammar, and hyphenation. Students submit a fully revised version of their paper as a final product.
2 units (Peshkin) not given 2000-01

401. Mini Courses in Methodology—For doctoral students. Particular issues during designated quarters. Enrollment limited. Prerequisite: consent of instructor.
1-2 units (Staff) not given 2000-01

405. Education and Political Change—Introductory analysis of the relations between education and social and political change from a comparative perspective. Topics: different theoretical approaches to the study of education and politics, questions of legitimacy in educational policy, international factors in educational development, the politics of educational planning and reform, processes and conditions of political learning, and the politics of curriculum and pedagogy. (SSPEP/ICE)
4-5 units (Mundy) not given 2000-01

408. Research Workshop in International and Comparative Education—Limited to advanced doctoral students in ICE and SSPEP. Research workshop for the review of key issues in the methodology and epistemology of social research in education, research proposals, and findings by students and faculty. Prerequisites: 306A,B,C,D or equivalents. (SSPEP/ICE)
2-5 units, Win (Carnoy)

410. Topics in Symbolic Systems in Education—For students in all areas. Topics in the interdisciplinary study of intelligence, information, meaning, and learning, emphasizing research relevant to educational practice. Research perspectives from anthropology, artificial intelligence, linguistics, philosophy, and psychology. (PSE)
1 unit, Aut, Win, Spr (Greeno)

412X. Setting Priorities, Standards and Policies in Education Research—Review of current research and classic papers on the psycholinguistics and sociolinguistics of bilingualism. (PSE)
3 units (Hakuta) not given 2000-01

416. Seminar on Aptitude—Limited to doctoral students in education and psychology. The study of individual differences in learning, cognitive, connotative, and affective processes related to education. The design and evaluation of instruction with respect to individual differences. Prerequisites: 255 or equivalent, and consent of instructor. (PSE)
3 units (Staff) not given 2000-01

418. Foundations of Field Research in Higher Education—For higher education/APA graduate students, and appropriate for doctoral students working on qualifying papers or dissertations. Advanced seminar examines the rationales for doing interpretive social science research in higher education settings. Students acquire methodological training in fieldwork through hands-on opportunities to collect, analyze, and critique case study data obtained from interviews, observation, and document analysis. Prerequisites: 346, consent of instructor. (SSPEP/APA)
3-5 units (Christopher) not given 2000-01

420A,B,C. Advanced Seminar in Philosophy of Education—Particular issues during designated quarters. Enrollment limited; sign up with instructor prior to beginning of quarter. (SSPEP)
420A. 3 units, Aut (Callan)
420B. 1-3 units (Phillips) not given 2000-01
420C. 1-3 units (Callan) not given 2000-01

422A,B,C. Practicum for School Principals—The major tasks and related activities of principals. Uses a training approach that is problem rather than discipline based and provides for a substantial degree of self-directed learning by students under the guidance of professors and practicing principals. (SSPEP/APA)
6 units, Sum (Copland)

423A. Introduction to Research Design: Educational Administration and Policy Analysis—Preference to APA doctoral students working on their sixth-quarter qualifying paper. Focus is on the key issues in conceptualizing and designing research in the social sciences. (SSPEP/ APA)
3-5 units, Win (Gumport, Smith)

425X. Advanced Seminar: Federal Educational Policy—Limited to doctoral students. Focus is on policy trends, dilemmas, and issues in Federal education policy over the past 40 years. Issues of federal purpose and role, centralization and decentralization, equality and quality, civil rights, evaluation and research, and the implementation of federal programs. Early childhood, K-12 and post-secondary education. Requires a significant and potentially publishable analysis of a federal policy or practice. (SSPEP/APA)
3 units, Win (Smith)

430A. Advanced Seminar in Childhood and Adolescent Development—Limited to advanced doctoral students in PSE and others with a strong background in developmental psychology, and offered in conjunction with the doctoral training seminar at the Center on Adolescence. In-depth readings/discussions about the developmental processes that account for adaptation (or non-adaptation) in interpersonal models of social and personality development. Selected research on topics that are drawing attention in the field at the present time. Emphasis is on contemporary frameworks for understanding social and personality development. Prerequisite: consent of instructor.
3 units, Aut (Damon)

431. Doctoral Seminar: Counseling and Health Psychology—Analysis of professional problems. May be repeated for credit. Prerequisites: doctoral candidates in counseling psychology, consent of instructor. (PSE)
1-3 units, Aut, Win, Spr (LaFromboise, Krumboltz)

435X. Research Seminar in Applied Linguistics—For graduate students in the schools of Education, and Humanities and Sciences, who are engaged in research pertaining to various applied linguistic topics in original research. Topics: language policies and planning, language and gender, writing and critical thinking, foreign language education, and social applications of linguistic science. (SSPEP)
1-4 units, Spr (Baugh)

444X. Research in Progress: Curriculum and Teacher Education— Required of first- and second-year doctoral students in CTE. Introduction to current research in the Curriculum and Teacher Education area. Weekly presentations of research planned, under way, or ready to be reported on some aspect of curriculum and teacher education by SUSE faculty, SUSE masters' or doctoral candidates, and faculty from else-
where in the University or Bay Area. Questions and discussion of conceptual and methodological issues. (CTE)

1 unit, Aut (Atkin)
Win (Peshkin)
Spr (Ball)

460. Advanced Seminar in Evaluation Design—Three quarters; for A.M. Policy Analysis and Evaluation students in the evaluation track. Discussion about evaluation issues, including the significance of multidisciplinary teamwork, design issues, negotiation, interpersonal skills, and ethics. (SSPEP/APA)

1 unit, Aut, Spr (Fetterman)

62. Doctoral Dissertation—For doctoral students only. (All Areas)

7-75 units, any quarter (Staff)

461X. Schooling and Mental Health Issues—Between 12-30% of all school-aged children experience moderate to severe emotional/behavioral difficulties. Many never receive services either within or outside of school to redress these difficulties, and untreated emotional/behavioral problems often undermine the affected children’s ability to learn, and their teachers’ ability to effectively teach. The theoretical/empirical, practical, and methodologic goals.

4 units (Roeser) not given 2000-01

466. Doctoral Seminar in Curriculum—Required of all doctoral students in CTE. The research and scholarship related to the CTE program at Stanford, acquainting students with the field, student research activities, and the kinds of problems they believe important in the field. All CTE faculty, other Stanford faculty, and outside speakers participate. Major problems in the field and the ways these are addressed by current investigators. (CTE)

2-4 units, Win (Atkin, Walker)

470. Practicum—For advanced graduate students. (All Areas)

1-15 units, any quarter (Staff)

470E. Practicum in Evaluation—Students participate in or conduct an evaluation. Topics of current interest in the area of educational evaluation. Prerequisite: student member of the Evaluation Consortium.

1-15 units, any quarter (Staff)

480. Directed Reading—For advanced graduate students. (All Areas)

1-15 units, any quarter (Staff)

490. Directed Research—For advanced graduate students. (All Areas)

1-15 units, any quarter (Staff)

493A. Seminar on Methodological Problems in Educational Research—Discussion of topics of current methodological interest. Practicum in consulting on actual projects being carried out by faculty and students.

1-3 units (Olkin) not given 2000-01

493B. Statistical Methods for Meta-Analysis—(Same as Health Research and Policy 206, Statistics 211.) Meta-analysis is a quantitative method for combining the results of independent studies, and enables researchers to synthesize the results of related studies so that the combined weight of evidence can be considered and applied. Examples from the medical, behavioral, and social sciences. Topics: literature search, publication and selection bias, statistical methods (contingency tables, cumulative methods, sensitivity analyses, non-parametric methods). Project. Prerequisite: basic sequence in statistics. (All Areas)

3 units, not given 2000-01
School of Engineering

Dean: James D. Plummer
Senior Associate Deans: John C. Bravman (Student Affairs), Anthony J. DiPaolo (SCPD), Anne R. Hannigan (Administration), Jeffrey R. Koseff (Faculty Affairs), Laura L. Breyfogle (External Relations)
Associate Dean: Noé P. Lozano (Diversity Programs)
Assistant Deans: Susan Clement (Graduate Student Affairs), Rene Cortinaz (Human Resources), Erica O’Neal (Diversity Programs)

Faculty Teaching General Engineering Courses

Associate Professors: Per K. Enge, David L. Freyberg, Kosuke Ishii, Bruce B. Lusignan, Mark G. Mungal, Stephen M. Rock
Assistant Professors: Christopher F. Edwards, Claire J. Tomlin
Professor (Research): Butrus T. Khuri-Yakub, Paul A. Durbin
Professors (Teaching): Gilbert M. Masters, Robert E. McGinn, Eric S. Roberts
Associate Professor (Teaching): Thomas H. Byers
Senior Lecturer: David Louge
Lecturers: Gerald Cain, Thomas Chou, Patrick Young, Julie Zelenski
Consulting Professors: Anoop Gupta, Richard Reis

The School of Engineering offers undergraduate programs leading to the degree of Bachelor of Science (B.S.), programs leading to both B.S. and Master of Science (M.S.) degrees, other programs leading to a B.S. with a Bachelor of Arts (A.B.) in a field of the humanities or social sciences, dual-degree programs with certain other colleges, and graduate curricula leading to the degrees of M.S., Engineer, and Ph.D.

The school has eight academic departments: Aeronautics and Astronautics, Chemical Engineering, Civil and Environmental Engineering, Computer Science, Electrical Engineering, Management Science and Engineering, Material Science and Engineering, and Mechanical Engineering. These departments and one interdisciplinary program, Scientific Computing and Computational Mathematics, are responsible for graduate curricula, research activities, and the departmental components of the undergraduate curricula. In research, where faculty interest and competence embraces both engineering and the supporting sciences, there are numerous programs within the school as well as several interschool activities, including the Alliance for Innovative Manufacturing at Stanford, Center for Integrated Systems, Center for Materials Research, Center on Polymer Interfaces and Macromolecular Assemblies, Center for Space Science and Astrophysics, Joint Institute for Aeronautics, Microwave Laboratory, the NIH Biotechnology Graduate Training Grant in Chemical Engineering, a program in Product Design, and the Radio Astronomy Institute. Petroleum Engineering is offered through the School of Earth Sciences.

Instruction in engineering is offered primarily during the Autumn, Winter, and Spring quarters of the regular academic year. During the Summer Quarter, a small number of undergraduate and graduate courses are offered.

UNDERGRADUATE PROGRAMS

The principal goals of the undergraduate engineering curriculum are to provide opportunities for intellectual growth in the context of an engineering discipline, for the attainment of professional competence, and for the development of a sense of the social context of technology. The curriculum is sufficiently flexible that a number of decisions on individual courses are left to the student and the adviser. For a student with well-defined educational goals, there is often a great deal of latitude.

In addition to the special requirements for engineering majors described below, all undergraduate engineering students are subject to the University general education, writing, and foreign language requirements outlined in the first pages of this bulletin. Depending on the program chosen, students have the equivalent of from one to three quarters of free electives to bring the total number of units to 180.

The School of Engineering's Handbook for Undergraduate Engineering Programs is available online at http://ugsb.stanford.edu and provides detailed descriptions of all undergraduate programs in the school, as well as additional information about extracurricular programs and services. A hard copy version is also available from the Office of Student Affairs in Terman Engineering Center, room 201. Because it is published in the summer, and updates are made to the website on a continuing basis, the handbook reflects the most up-to-date information for the academic year and is the definitive reference for all undergraduate engineering programs.

Accreditation—The Accreditation Board for Engineering and Technology (ABET) accredits college engineering programs nationwide using criteria and standards developed and accepted by U.S. engineering communities. At Stanford, the following undergraduate programs are accredited: Chemical Engineering, Civil Engineering, Electrical Engineering, Industrial Engineering, and Mechanical Engineering. In ABET-accredited programs, students must meet specific requirements for engineering science, engineering design, mathematics, and science coursework. Students are urged to consult the School of Engineering Undergraduate Handbook and their adviser.

Accreditation is important in many areas of the engineering profession; students wishing more information about accreditation should consult their department office or the office of the Senior Associate Dean for Student Affairs in Terman 201.

Policy on Satisfactory/No Credit Grading and Minimum Grade Point Average—All courses taken to satisfy major requirements (including the requirements for mathematics, science, engineering fundamentals, Technology in Society, and engineering depth) for all engineering students (including both department and School of Engineering majors) must be taken for a letter grade if the instructor offers that option. For departmental majors, the minimum GPA (grade point average) for all courses taken in fulfillment of the Engineering Fundamentals requirement and the Engineering Depth requirement is 2.0. For School of Engineering majors, the minimum GPA on all engineering courses taken in fulfillment of the major requirements is 2.0.

ADMISSION

Students admitted to the University may declare a major in the School of Engineering if they elect to do so; no additional courses or examinations are required for admission to the school.

RECOMMENDED PREPARATION

FRESHMEN

Students who plan to enter Stanford as freshmen and intend to major in engineering should take the highest level of mathematics offered in high school. (See the "Mathematics" section of this bulletin for information on advanced placement in mathematics.) High school courses in physics and chemistry are strongly recommended, but not required. Additional elective course work in the humanities and social sciences is also recommended.

TRANSFER STUDENTS

Students who do the early part of their college work elsewhere and then transfer to Stanford to complete their engineering programs should follow an engineering or pre-engineering program at the first school, selecting insofar as possible courses applicable to the requirements of the School of Engineering, that is, courses comparable to those described below under "Undergraduate Programs." In addition, students should work toward completing the equivalent of Stanford's foreign language requirement and as many of the University's General Education Requirements (GERs) as possible before transferring. Some transfer students may require more than four years (in total) to obtain the B.S. degree. However, Stanford affords great flexibility in planning and scheduling individual programs which makes it possible for transfer students, who have wide
variations in preparation, to plan full programs for each quarter and to progress toward graduation without undue delay.

Transfer credit is given for courses taken elsewhere whenever the courses are equivalent or substantially similar to Stanford courses in scope and rigor. The policy of the School of Engineering is to study each transfer student’s preparation and make a reasonable evaluation of the courses taken prior to transfer. Inquiries may be addressed to the Senior Associate Dean for Student Affairs and the Assistant Director for Undergraduate Studies in the School of Engineering at Stanford. For more information, please see the transfer credit section of the School of Engineering Undergraduate Handbook website at http://ughb.stanford.edu.

DEGREE PROGRAM OPTIONS

3/2 DEGREE PROGRAMS

The 3/2 engineering program at Stanford is a special opportunity that allows a student to complete three years at a liberal arts college followed by two years at Stanford. After completing the five-year program, the student is awarded two degrees, a B.S. in Engineering from Stanford and an A.B. from the liberal arts college.

Candidates for this special dual-degree program are considered as regular transfer applicants and are expected to meet the same admissions standards as all other transfer candidates. This distinguishes the Stanford 3/2 program from those of most other institutions that “guarantee” admission to students who meet certain grade and course requirements and are recommended by the 3/2 coordinator of the liberal arts college.

All 3/2 transfer applicants are required to submit the transfer application forms, a final secondary school transcript, official transcripts from each college attended, and the official results of either the College Board Scholastic Aptitude Test (SAT) or the American College Test (ACT). All materials must be submitted by the regular transfer deadline.

In addition to the above mentioned documents, dual-degree candidates are required to have a letter of recommendation sent from the liberal arts college 3/2 program coordinator. Also required is a letter from the appropriate academic dean indicating the intention of the liberal arts college to award the A.B. degree, not the B.S. degree, upon completion of the required number of course credits. Applications are only accepted from students attending a liberal arts college that does not offer a degree program in engineering.

BACHELOR OF ARTS AND SCIENCE (B.A.S.)

This degree is available to students who complete both the requirements for a B.S. degree in engineering and the requirements for a major or program ordinarily leading to the A.B. degree. For more information, see the “Graduate Degrees” section of this bulletin.

DUAL AND COTERMINAL DEGREE PROGRAMS

A Stanford undergraduate may work simultaneously toward two bachelor’s degrees or toward a bachelor’s and a master’s degree, that is, A.B. and M.S., A.B. and A.M., B.S. and M.S., or B.S. and A.M. The degrees may be granted simultaneously or at the conclusion of different quarters. Usually five years are needed for a combined program.

Dual A.B. and B.S. Degree Program—To qualify for both degrees, a student must (1) complete the stated University and department requirements for each degree, (2) complete 15 full-time quarters, or three full-time quarters after completing 180 units, and (3) complete a total of 225 units (180 units for the first bachelor’s degree plus 45 units for the second bachelor’s degree).

Coterminal Bachelor’s and Master’s Degree Program—A Stanford undergraduate may be admitted to graduate study for the purpose of working simultaneously toward a bachelor’s degree and a master’s degree. To qualify for both degrees, a student must (1) complete three full-time quarters (or the equivalent) after completing 180 units, (2) complete, in addition to the 180 units required for the bachelor’s degree, the number of units required by the graduate department for the master’s degree (not fewer than the University minimum of 36 units), (3) complete the requirements for the bachelor’s degree (department, school, and University) and apply for the degree at the appropriate time at the Office of the Registrar, and (4) complete the department and University requirements for the master’s degree and apply for the degree at Degree Progress in the Registrar’s Office.

Admission to the coterminal program requires admission to graduate status by the pertinent department. Admission criteria vary from department to department.

Procedure for Applying for Admission to Coterminal Degree Programs—A Stanford undergraduate may apply (using the University coterminal application form) for admission to the coterminal bachelor’s and master’s degree program after the beginning of the eighth quarter of undergraduate work and no later than the end of the 11th quarter of undergraduate work, and at least four quarters in advance of the anticipated date of conferment of the master’s degree. Students seeking a graduate degree in engineering must apply to the pertinent department.

BACHELOR OF SCIENCE

Departments within the School of Engineering offer programs leading to the B.S. degree in the following fields: Chemical Engineering, Civil Engineering, Computer Science, Electrical Engineering, Environmental Engineering, Industrial Engineering, Materials Science and Engineering, and Mechanical Engineering. The School of Engineering itself offers interdisciplinary programs leading to the B.S. degree in Engineering with specializations in Aeronautics and Astronautics, Computer Systems Engineering, and Product Design. In addition, students may elect an Individually Designed Major leading to the B.S. in Engineering.

Petroleum Engineering—Petroleum Engineering is offered by the School of Earth Sciences. Consult the “Petroleum Engineering” section of this bulletin for requirements.

School of Engineering majors who anticipate summer jobs or career positions associated with the oil industry may wish to consider enrolling in Engineering 120, Fundamentals of Petroleum Engineering.

Programs in Manufacturing—Programs in manufacturing are available at the undergraduate, M.S., and Ph.D. levels. The undergraduate programs of the departments of Civil and Environmental Engineering, Management Science and Engineering, and Mechanical Engineering provide general preparation for any student interested in manufacturing. More specific interests can be accommodated through Individually Designed Majors (IDMs).

SCHOOL OF ENGINEERING MAJORS

The School of Engineering offers the degree of Bachelor of Science in Engineering. School of Engineering programs must be approved by the Undergraduate Council of the school. There are two types of programs: majors that have been proposed by cognizant faculty groups and have been approved by the council, and Individually Designed Majors. At present, there are three preapproved majors: Aeronautics and Astronautics, Computer Systems Engineering, and Product Design. Total units required for these majors must be at least 90 and not more than 107. These majors are not accredited by ABET.

AERONAUTICS AND ASTRONAUTICS (AA)

Mathematics: (21 units)
- Math. 35 or 130, or Mech. Engr. 100. Differential Equations 3-5
- Math electives (See Basic Requirement 1)

Science: (18 units)
- Physics 41. Mechanics 3
- Physics 43 or 23. Electricity 3
- One further physics course 3
- Science electives (see Basic Requirement 2) 9

Engineering Fundamentals: (five courses)
- Engr. 30. Engineering Thermodynamics 3
- Engr. 70A. or 70X. Programming 5
- Engr. 15. Dynamics 3
- Two Fundamental courses (See Basic Requirement 3)

Technology in Society: (3-5 units)
- One course (See Basic Requirement 4)

Engineering Depth: (39 units)
- AA 100. Introduction to Aeronautics and Astronautics 3
- AA 190. Directed Research in Aeronautics and Astronautics 3
- Civ. & Envr. Engr. 180A. Introduction to Structural Analysis or Mech. Engr. 111. Stress, Strain, and Strength 3

97
Engr. 104. Dynamic Behavior  
or Mech. Engr. 161. Dynamic Systems  
or Phys. 110. Intermediate Mechanics  
Mech. Engr. 33. Introduction to Fluids Engineering  
Mech. Engr. 131A. Heat Transfer  
Mech. Engr. 131B. Fluid Mechanics  
Depth Area I*  
Depth Area II*  
Engineering Electives†  
Total .................................. 100-106  
* Two of the following areas:  
Fluids (AA 200A, 210A, 214A, 280 or 283; Mech. Engr. 131C)  
Structures (AA 240A, 240B, 256)  
Dynamics and Controls (AA 271A, Engr. 105, 205)  
Systems Design (AA 241A, 241B, 236A, 236B)  
† Electives are to be approved by the adviser, and might be from the Depth area lists, or courses such as AA 201A, 210B, 252; Engr. 206, 209A, 209B; or other upper-division engineering courses.

COMPUTER SYSTEMS ENGINEERING (CSE)  
Mathematics: (23 units)  
Math. 41, 42, 51. Calculus  
Math. 52 or 53. Multivariable Math  
Math. 103 or 113. Linear Algebra*  
Science: (13 units)  
Phys. 41. Mechanics  
Phys. 43. Electricity  
Phys. 45. Magnetism  
Phys. 47. Light and Heat  
Engineering Fundamentals: (10 units)  
Engr. 40. Electronics  
Engr. 70X. Programming Methodology and Abstractions  
or Comp. Sci. 106A and B  
Technology in Society: (3-5 units)  
one course (See Basic Requirement 4)  
Writing in the Major (one course)  
Comp. Sci. 191W, 194, and 201 fulfill this requirement  
Depth: (53 units)  
Comp. Sci. 103A. Discrete Mathematics for CS  
Comp. Sci. 103B. Discrete Structures  
Comp. Sci. 107. Programming Paradigms  
Comp. Sci. 108. Object-Oriented Systems Design  
Comp. Sci. 140. Operating Systems  
or Comp. Sci. 143. Compilers  
Elect. Engr. 101. Circuits  
Elect. Engr. 111, 112. Electronics  
Elect. Engr. 121. Digital Design Laboratory  
Elect. Engr. 182. Computer Organization  
Elect. Engr. 183. Advanced Logic Laboratory  
Elect. Engr. 271. Introduction to VLSI Systems  
Electives*  
Senior Project (Comp. Sci. 191, 191W, or 194) **  
Total .................................. 102-104  
* Completion of Math. 52 and 53 will satisfy the Math. 103/113 requirement.  
† The list of approved electives is reviewed annually by the CS Undergraduate Program Committee. The current list consists of CS 110, 121 or 221, 137, 140, 143, 145, 147, 148 or 248, 154, 157, 161, 205, 206, 222, 223A, 223B, 224A, 224M, 225A, 225B, 226, 227, 228, 229 240, 242, 243, 244A, 245, 247A, 247B, 249, 255, 256, 257, 258, 261, 270A, 270B, 271, 272, 274; Elect. Engr. 212, 216, 247, 264, 272, 278, 282  
** Independent study projects (Comp. Sci. 191, or 191W) require faculty sponsorship and must be approved in advance by the adviser, faculty sponsor, and the CSE program adviser (E. Roberts). A signed approval form, along with a brief description of the proposed project, should be filed at least two quarters before graduation. Further details can be found in the Handbook for Undergraduate Engineering Programs at http://ughb.stanford.edu.

PRODUCT DESIGN  
Mathematics: 20 units minimum  
Recommended: one course in Statistics  
Science: 17 units minimum  
Recommended: one year of Physics  
Psy. 1. Introduction to Psychology (required)  
Psy. 161. Cultural Psychology (required)  
Mathematics and Science: minimum combined total of 45 units  
Engineering Fundamentals: 18 units minimum  
Engr. 40, 70 required, plus remainder of course work from  
Engr. 10, 15, 20, 25, 30, 50, 60; Manage. Sci. & Engr. 100, 133  
Technology in Society:  
Mech. Engr. 120. History of Philosophy of Design (required)  
Engineering Depth: 45 units  
Art & Art Hist. 60. Basic Design  
Art & Art Hist. 160. Intermediate Design  
Art & Art Hist. 161 or 70 (recommended)  
Art Studio courses (two)  
Engr. 102M  
Mech. Engr. 103. Manufacturing and Design  
Mech. Engr. 103D. Engineering Drawing  
Mech. Engr. 111. Stress, Strain, and Strength  
Mech. Engr. 112. Mechanical Systems  
Mech. Engr. 115. Human Values in Design  
Mech. Engr. 110A. Design Sketching  
or 116D. Advanced Design Sketching  
Mech. Engr. 116A. Advanced Product Design  
Mech. Engr. 116B. Advanced Product Design  
Mech. Engr. 116C. Advanced Product Design†  
Total maximum units .................................. 107  
* One quarter abroad may substitute for this course.  
† Combined Product Design/Mech. Engr. students.

INDIVIDUALLY DESIGNED MAJORS (IDMs)  
IDMs are intended for undergraduates interested in pursuing engineering programs that, by virtue of their focus and intellectual content, cannot be accommodated by existing departmental majors or the preapproved School of Engineering majors. IDM curricula are designed by students with the assistance of two faculty advisers of their choice and are submitted to the Undergraduate Council’s Subcommittee on Individually Designed Majors. The degree conferred is “Bachelor of Science in Engineering: (approved title).”

Students must submit written proposals to the IDM Subcommittee detailing their course of study. Programs must meet the following requirements: mathematics (21 units minimum, see Basic Requirement 1 below), science (17 units minimum, see Basic Requirement 2 below), Technology in Society (one approved course, see Basic Requirement 4 below), engineering (40 units minimum), and sufficient relevant additional coursework to bring the total number of units to at least 90 and at most 107. (Students may take additional courses pertinent to their IDM major, but the IDM proposal itself may not exceed 107 units.) The student’s curriculum must include at least three “Engineering Fundamentals” courses (Engineering 10, 14, 15, 20, 25, 30, 40, 50, 60, 70A, and 70X). Students are responsible for completing the prerequisites for all courses included in their majors.

Each proposal should begin with a statement describing the proposed major. In the statement, the student should make clear the motivation for and goal of the major, and indicate how it relates to her or his projected career plans. The statement should also specify how the various courses to be taken relate to and move the student toward realizing the major’s goal. A proposed title for the major should be included. The title approved by the IDM Subcommittee will be listed on the student’s official University transcript.

The proposal statement should be followed by a completed Program Sheet listing all the courses comprising the student’s IDM curriculum, organized by the five categories printed on the sheet (mathematics, science, Technology in Society, additional courses, and engineering depth). Normally, the courses selected should comprise a well-coordinated sequence or sequences that provide mastery of important principles and techniques in a well-defined field. In some circumstances, especially if the proposal indicates that the goal of the major is to prepare the student for graduate work outside of engineering, a more general engineering program may be appropriate. A four-year study plan, showing which courses will be taken each quarter should also be included in the student’s IDM proposal.

The proposal must be signed by two faculty members whose signatures certify that they endorse the major as described in the proposal and that they agree to serve as the student’s permanent advisers. One of the faculty members, who must be from the School of Engineering, acts as the student’s primary adviser. The proposal must be accompanied by a statement from that person giving her or his appraisal of the academic value and viability of the proposed major.

Students proposing IDMs must have at least four quarters of undergraduate work remaining at Stanford after the quarter in which their proposals are first submitted. Any changes in a previously approved major must be endorsed by the advisers and reapproved by the IDM subcommittee. A request by a student to make changes in her or his approved curriculum must be made sufficiently far in advance so that, should the
request be denied, adequate time remains to complete the original, approved curriculum. Proposals are reviewed and acted upon once a quarter. Forms may be obtained from, and completed proposals should be submitted to, the Office of the Senior Associate Dean for Student Affairs, Terman 201.

DEPARTMENT MAJORS

Curricula for majors offered by the departments of Chemical Engineering, Civil Engineering, Electrical Engineering, Management Science and Engineering, Materials Science and Engineering, and Mechanical Engineering have the following components: 40-47 units of mathematics and science (see Basic Requirements 1 and 2 at the end of this section); engineering fundamentals (three course minimum, at least one of which must be unspecified by the department, see Basic Requirement 3); Technology in Society (TIS) (one course minimum, see Basic Requirement 4); engineering depth (courses such that the total of units for Engineering Fundamentals and Engineering Depth is between 60 and 75). Included within the courses taken to fulfill the preceding curriculum components is a requirement for a minimum of 8 units of experimentation (see below). Curricular requirements for departmental majors were being revised at the time of publication. Please consult the 2000-01 Handbook for Undergraduate Engineering Programs online at http://ughb.stanford.edu for the most up-to-date listing of curricular requirements.

The curriculum for the major offered by the Department of Computer Science has separate requirements as described below.

**Experimentation**—Departmental major programs other than Computer Science must include 8 units of experimentation. Lab courses taken in the sciences, as well as experimental work taken in courses within the School of Engineering, can be used in fulfillment of this requirement. By careful planning, the experimentation requirement should not necessitate additional course work beyond that required to meet the other components of an engineering major. A list of courses and their experimentation content (in units) can be found online at http://ughb.stanford.edu in the 2000-01 Handbook for Undergraduate Engineering Programs.

---

* Math. 19, 20, and 21 may be taken instead of Math. 41 and 42 as long as at least 25 math units are taken. 
† The science elective may be any course of 3 or more units from the School of Engineering lists plus Psych 30 or 40, AP Biology or Chemistry also meets this requirement. Either of the Physics sequences 61/63 or 21/23 may be substituted for 41/43/45 as long as at least 12 science units are taken. 
** The two systems courses must be chosen from the following set: CS 140, 143, 242, and 244A. The systems electives must include a course with a large software project, currently satisfied by either CS 140 or 143. 
†† The applications elective must be chosen from the following set: CS 145, 147, 148, 223A, 223B, 224A, 224B, 224C. 
*** Independent study projects (CS 191 or 191W) require faculty sponsorship and must be approved by the advisor, faculty sponsor, and the CS program advisor (E. Roberts).
ENGINEERING DEPTH:

Engineering Fundamentals:

Technology in Society: one course

Mathematics:

- Statistics: EE 177 or EE 178

- Math or Science Electives: 3-4

Total Math and Science Units: 45

Math: 41, 42, 51, 52, 53

Science:

- Physics: (41, 43, 45, 47) or (61, 63, 65)

Statistics: EE 177 or EE 178

- Math or Science Electives: 3-4

Total for Engineering Fundamentals plus Depth: 45

Electrical Engineering electives: 9-14

Total Engineering depth required: 58

- These requirements are subject to change. The final requirements are published along with example programs in the School of Engineering Undergraduate Handbook during the summer.

- The Statistics course can count either as a Math and Science elective or as an Electrical Engineering elective, but not both.

- Three courses from one of the specialty areas shown below (consultation with an advisor in the selection of these courses is especially important).

- Computer Hardware: EE 144 (Comp. Sci. 107), 182 (183 or 281), 271 or 275

- Computer Software: EE 184 (Comp. Sci. 107), 189A (Comp. Sci. 108), 189B (Comp. Sci. 194), 284 or Comp. Sci. 244A

- Controls: Engr. 105, EE 205 (Engr. 205), EE 206 (Engr. 206), EE 209 (Engr. 209)

- Electronics: EE 133, 212, 214, 216

- Fields and Waves: EE 141

- Signal Processing and Communication: EE 104, 133, 144, 183, 281; Engr. 206.

- Additional course not in EE or Comp. Sci. 3-5

- Engineering Depth:

- Circuits and Systems: EE 101, 102, 103

- Laboratory: EE 121, 122

- Technical Writing: Engr. 102E

- One course in Design†

- Total for Engineering Electives: 9-14

- Total for Engineering Fundamentals plus Depth: 68

† The design course may be, but need not be, part of the specialty sequence. The following courses satisfy this requirement: EE 189B (Comp. Sci. 194), 133, 144, 183, 281; Engr. 206.

ENVIRONMENTAL ENGINEERING (in CEE)

Mathematics and Science:

- 45 unit minimum* (See Basic Requirement 1 and 2)

- Technology in Society† (one course): (See Basic Requirement 4)

Engineering Fundamentals:

- Three courses** (See Basic Requirement 3) 9-11

Engineering Depth:

- CEE 64. Air Pollution: From Urban Smog to Global Change

- CEE 70. Environmental Science and Technology

- CEE 100. Managing Civil Engineering Projects

- CEE 101B. Mechanics of Fluids

- CEE 101E. Analytical and Numerical Methods for the Environment

- CEE 160. Fluid Mechanics Laboratory

- CEE 161. Open Channel and Pipe Flows

- CEE 162. Hydrology and Water Resources

- CEE 171. Environmental Planning Methods

- CEE 172. Air Quality Management

- CEE 177. Aquatic Chemistry and Biology

- Capstone design experience (either CEE 169, or CEE 179A & B)

- CEE Breadth Electives†† 8

- Other School of Engineering Electives 6-8

- Total for Engineering Fundamentals plus Depth: 68

* Mathematics must include CEE 101D, Engr. 155A, and Stat. 190. Science must include Physics 41; Chem. 31, 33; and Geol. & Envir. Sci. 1.

† Must choose a class that specifically includes an ethics component, such as STS 101, 110, 115, 170 or 215.

** Fundamentals must include Engr. 30 and 60.

MANAGEMENT SCIENCE AND ENGINEERING (MS&E)

Mathematics: 28 units minimum* (See Basic Requirement 1)

- Math. 41

- Math. 42

- Math. 51 or Math. 43

- Stat. 110 (Stat. 110 is recommended) 4-3

- MS&E 120

- MS&E 121

Science: 14 units minimum* (See Basic Requirement 2)

- Engineering Fundamentals: five courses (See Basic Requirement 3)

- Comp. Sci. 106A

- Engr. 40.

- Engr. 60.

- Two other engineering fundamentals from School of Engineering approved list

- Technology in Society: one course† (See Basic Requirement 4)

- Engineering Depth:

- Comp. Sci. 106B or 106X. Programming Abstractions

- Engr. 62. Introduction to Optimization

- MS&E 180. Organizations: Theory and Management

- MS&E 108 or 131. Senior Project or Information Science

- MS&E 242 or 245E or 245G. Investment Science/Finance

- Concentration Depth (choose one of the following five

- Concentrations):

- Industrial Engineering/Operations Management Concentration**: 27-29

- MS&E 130. Information Systems

- MS&E 160. Industrial Accounting

- MS&E 161. Analysis of Production and Operating Systems

- MS&E 164. Manufacturing Systems Design

- MS&E 169. Quality Assurance and Control

- Two electives from MS&E approved list††† 23-30

- Operations Research Concentration: 26-29

- Math. 52. Ordinary Differential Equations with Linear Algebra

- Four of the following nine courses:

- MS&E 107. Interactive Management Science

- MS&E 152. Introduction to Decision Analysis

- MS&E 201. Dynamic Systems

- MS&E 211. Linear and Nonlinear Optimization

- MS&E 212. Network Integer Programming

- MS&E 222. Probabilistic Analysis II

- MS&E 223. Simulation

- MS&E 224. Stochastic Models in Operations Research

- MS&E 251. Stochastic Decision Models

- One of the following three courses:

- Comp. Sci. 109. Introduction to Computer Science

- Comp. Sci. 137. Introduction to Scientific Computing

- Econ. 50. Economic Analysis

- MS&E 130. Information Systems

- Technology and Policy Concentration: 24-30

- Econ. 50. Economic Analysis I

- Econ. 51. Economic Analysis II

- Econ. 150/Pol. 104. Economics and Public Policy

- One of the following three courses:

- MS&E 197. Ethics and Public Policy

- MS&E 267. Legal Strategy and Analysis

- Pol. Sci. 182F. Introduction to American Law

- One of the following two courses:

- MS&E 193. Role of Technology in National Security

- One of the following four courses:

- MS&E 194. The Role of Analysis in Environmental Policy Decisions

- MS&E 196. Transportation Systems and Urban Development

- MS&E 297. Progress in Worldwide Telecommunications

- MS&E 298. Technology Policy and Management in Newly Developed Countries

- Financial and Decision Engineering Concentration: 27-29

- MS&E 140. Industrial Accounting

- MS&E 152. Introduction to Decision Analysis

- MS&E 242. Investment Science

- One of the following three courses:

- Econ. 50. Economic Analysis I

- Econ. 51. Economic Analysis II

- Econ. 150/Pol. 104. Economics and Public Policy

- One of the following three courses:

- MS&E 197. Ethics and Public Policy

- MS&E 267. Legal Strategy and Analysis

- Pol. Sci. 182F. Introduction to American Law
Six of the following ten courses (including at least four of
Engr. 131, 145; MS&E 130, 164, 181, 182, 284):
Engr. 131. Ethical Issues in Engineering
Engr. 145. Introduction to High Technology
Engr. 161. Introduction to Mechatronics
Psych. 70. Introduction to Social Psychology
MS&E 130. Information Systems
MS&E 164. Manufacturing Systems Design
MS&E 181. Issues in Technology and Work in Post-Industrial Economics
MS&E 182. Work, Technology, and Society
MS&E 284. Technology and Work
Soc. 128. Groups, Teams, and Organizations
Soc. 160. Formal Organizations

*B Math and science must total 45 units. Electives must come from Self approved list.
** Technology in Society courses must be one of the following MS&E approved courses:
STS 101/Engr. 130, STS 110/MS&E 197, STS 115/Engr. 131, STS 135/MS&E 181, STS 162, STS 170/MS&E 182, STS 171/MS&E 193, STS 215, STS 279/MS&E 298.
** Students choosing the Industrial Engineering/Operations Management Concentration who meet the ABET requirement by taking or placing out of one year of Physics or Chemistry and other 18 quarters in the other discipline, will receive the Industrial Engineering Concentration. Students who do not meet the ABET requirements will receive the Operations Management Concentration.

MATERIALS SCIENCE AND ENGINEERING (MSE)
Mathematics: 21 units minimum
Science: 20 units minimum
Engineering Fundamentals (five courses): (See Basic Requirement 1)
Technology in Society (one course): (See Basic Requirement 4)

Engineering Depth:
MSE 151. Structural Materials Engineering 3
MSE 152. Electronic Materials Engineering 3
MSE 161. Materials Science Lab I 4
MSE 162. Materials Science Lab II 4
MSE 163. Materials Science Lab III 3
Materials Science Fundamentals* 24
Science and Engineering Options† 9
Total: 49

*MSE Fundamentals: 24 units from MSE 191, 192, 193, 194, 195, 196, 197, 198, 199
† MSE Fundamentals from one of the following six areas:
Chemistry (Chem. 151, 153, 171, 173, 175)
Chemical Engineering (Chem. Engr. 110, 120A, 120B, 160, 170)
Electrical Engineering (Elect. Engr. 101, 102, 111, 112, 113, 141, 142, Engr. 40)
Mechanical Engineering (Engr. 14, 15, Mech. Engr. 103, 111, 131A, 131B, 161)
Physics (Phys. 110, 111, 120, 121, 122, 130, 131, 132, 170, 171, 172)
Self-Defined Option (petition for a self-defined cohesive program, minimum of 9 units)

MECHANICAL ENGINEERING (ME)
Mathematics: 24 units minimum* (See Basic Requirement 1)
Science: 18 units minimum* (See Basic Requirement 2)
Engineering Fundamentals (five courses):† (See Basic Requirement 3)
Technology in Society (one course): (See Basic Requirement 4)

Engineering Depth:
ME 33. Introductory Fluids Engineering 1
ME 101. Visual Thinking 3
ME 103. Manufacturing Technology 4
ME 111. Stress, Strain, and Strength 3
ME 112. Mechanical Systems Design 4
ME 113. Engineering Design 3
ME 131A. Heat Transfer 4
ME 131B. Fluid Mechanics 3
ME 140. Integrated Thermal Systems or Engr. 104. Dynamic Behavior 3
ME 161. Mechanical Vibrations 4
Total: 42

Options to complete the ME Depth sequence (pick two items below):
Engr. 105A. Control Systems 3
ME 106. Vehicle Dynamics and Control 3
ME 117. Introduction to Sensors 3
ME 118. Introduction to Mechatronics 4
ME 130. Internal Combustion Engines 4
ME 134. Modern Experimentation 3
ME 131C. Thermodynamics 3
ME 180. Skeletal Development and Evolution 3
ME 181. Biomechanics of Movement 3

*B Math and science must total 45 units. Math: 24 units required and must include a course in differential equations (e.g., ME 100). Science: 18 units minimum and must include chemistry and physics, with at least one year’s study in one of them. Engr. 15, 30, 40, 70 are required.

BASIC REQUIREMENTS

Basic Requirement 1 (Mathematics)—Engineering students need a solid foundation in the calculus of continuous functions including differential equations, an introduction to discrete mathematics, and an understanding of statistics and probability theory. The minimum preparation should normally include calculus to the level of Mathematics 43. Knowledge of ordinary differential equations and matrices is important in many areas of engineering, and students are encouraged to select additional courses in these topics. To meet ABET accreditation criteria, a student’s program must include the study of differential equations.

Courses that satisfy the mathematics requirement are listed online at http://ugb斯坦福工程学院的Handbook for Undergraduate Engineering Programs.

Basic Requirement 2 (Science)—A strong background in the basic concepts and principles of natural science in such fields as biology, chemistry, geology, and physics is essential for engineering. Most students include the study of physics and chemistry in their programs. To meet ABET accreditation criteria, a student’s program must include study of both chemistry and physics, with at least one year’s study in one of them.

Courses that satisfy the science requirement are listed online at http://ugb斯坦福工程学院的Handbook for Undergraduate Engineering Programs.

Basic Requirement 3 (Engineering Fundamentals)—The Engineering Fundamentals requirement is satisfied by a nucleus of technically rigorous introductory courses chosen from the various engineering disciplines. It is intended to serve several purposes. First, it provides students with a breadth of knowledge concerning the major fields of endeavor within engineering. Second, it allows the incoming engineering student an opportunity to explore a number of courses before embarking on a specific academic major. Third, the individual classes each offer a reasonably deep insight into a contemporary technological subject for the interested non-engineer.

The requirement is met by taking five courses from the following list:
Engr. 10. Introduction to Engineering Analysis
Engr. 14. Applied Mechanics: Statics and Deformables or Engr. 15. Dynamics
Engr. 20. Introduction to Chemical Engineering
Engr. 25. Biotechnology
Engr. 30. Engineering Thermodynamics
Engr. 70A or 70X. Introduction to Software Engineering

Basic Requirement 4 (Technology in Society)—It is important for the student to obtain a broad understanding of engineering as a social activity. To foster this aspect of intellectual and professional development, all engineering majors must take one course devoted to exploring issues arising from the interplay of engineering, technology, and society. Courses that fulfill this requirement are listed online at http://ugb斯坦福工程学院的Handbook for Undergraduate Engineering Programs.

MINORS

An undergraduate minor in Engineering may be pursued by interested students in many of the School's departments; consult with a department's undergraduate program representative, or the Office of Student Affairs, Terman Engineering Center, room 201. General requirements and policies for a minor in the School of Engineering are: (1) a set of courses totaling not less than 18 and not more than 36 units, with a minimum of six courses of at least 3 units each; (2) the set of courses should be sufficiently coherent as to present a body of knowledge within a discipline or subdiscipline; (3) prerequisite mathematics, statistics, or science courses, such as those normally used to satisfy the School’s requirements for a department major, may not be used to satisfy the requirements
of the minor; conversely, engineering courses that serve as prerequisites for subsequent courses must be included in the unit total of the minor program; (4) departmentally based minor programs are structured at the discretion of the sponsoring department, subject only to requirements 1, 2, and 3 above. Interdisciplinary minor programs may be submitted to the Undergraduate Council for approval and sponsorship. A “General Engineering” minor is not offered.

AERONAUTICS AND ASTRONAUTICS (AA)

The Aero/Astro minor introduces undergraduates to the key elements of modern aerospace systems and their many spinoff technologies. Within the minor, students may focus on aircraft, spacecraft, or disciplines relevant to both. The course requirements for the minor are described in detail below. Courses cannot be double-counted within a major and a minor, or within multiple minors; if necessary, the Aero/Astro advisor can select substitute courses to fulfill the AA minor core.

The following core courses fulfill the minor requirements:

<table>
<thead>
<tr>
<th>Course No. and Subject</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engr.30. Thermodynamics*</td>
<td>3</td>
</tr>
<tr>
<td>Mech. Engr.33. Introductory Fluids</td>
<td>4</td>
</tr>
<tr>
<td>Mech. Engr.131A. Heat Transfer</td>
<td>5</td>
</tr>
<tr>
<td>Core Total</td>
<td>12-25</td>
</tr>
</tbody>
</table>

* Engr. 14, 15, or 30 are waived as minor requirements if already taken as part of the major.

The following courses are upper-division electives.

| Two courses from one of the elective areas below | 6 |
| Two course from a second area | |
| Program Total | 21-34 |

Fluids:

- AA 200A. Applied Aerodynamics
- AA 210A. Fund of Compressible Flow
- AA 214A. Numerical Methods in Fluid Mechanics
- AA 280. Rocket Propulsion
- or AA 283. Aircraft Propulsion

Structures:

- AA 240A. Analysis of Structures
- AA 240B. Analysis of Structure - II
- AA 256. Mechanics of Composites

Dynamics and Controls:

- AA 271. Dynamics and Control of Spacecraft/Aircraft
- AA 279. Space Mechanics
- Engr. 105. Feedback Control Design
- Engr. 205. Introduction to Control Design Techniques

Aerospace Systems Synthesis/Design:

- AA 236A.B. Aircraft Propulsion
- AA 236A.B. Aircraft Design
- AA 241A.B. Aircraft Design

CHEMICAL ENGINEERING

The following courses fulfill the minor requirements:

- Chem. Engr. 100. Chemical Process Modeling, Dynamics, and Control
- Chem. Engr. 110. Equilibrium Thermodynamics
- Chem. Engr. 120A. Fluid Mechanics
- Chem. Engr. 120B. Energy and Mass Transport
- Chem. Engr. 140. Microelectronics Processing Technology
- or Chem. Engr. 150. Biochemical Engineering
- or Chem. Engr. 160. Polymer Science and Engineering
- Chem. Engr. 185A. Chemical Engineering Lab
- Chem. Engr. 185B. Chemical Engineering Lab
- Chem. 171. Physical Chemistry
- Engr. 20. Introduction to Chemical Engineering

Total | 35

CIVIL ENGINEERING (CEE)

The Civil Engineering minor is intended to give students an in-depth introduction to one or more areas of civil engineering. Departmental expertise and undergraduate course offerings are available in the areas of Construction Engineering and Management and Structural Engineering. The necessary prerequisites for a civil engineering minor are Physics 41 and Mathematics 41, 42, and 51. Students should recognize that a minor in Civil Engineering is not an ABET-accredited degree program.

Since civil engineering is a very broad field and undergraduates having widely varying backgrounds may be interested in obtaining a civil engineering minor, no single set of course requirements is appropriate for all students. Instead, interested students are encouraged to propose their own set of courses within the guidelines listed below; this list must be officially approved by the CEE undergraduate minor advisor. Additional information on preparing a minor program, including “example” programs focusing on each of the areas of expertise listed above is available in the CEE office (Terman M-42). While each example program focuses on a different area of expertise within the department, other combinations of courses are also possible.

General guidelines are:

1. A Civil Engineering minor must contain at least 24 units of course work not taken for the major, and must consist of at least six classes.
2. The list of courses must represent a coherent body of knowledge in a focused area, and should include classes that build upon one another.
3. Professor Street (Terman M-17; phone, 3-4969; e-mail street@ee) is the CEE undergraduate minor advisor, and provides guidance and advice. Students must consult with Professor Street in developing their minor program, and obtain approval of the finalized study list from him.

COMPUTER SCIENCE (CS)

The following courses fulfill the minor requirements. Prerequisites include the standard mathematics sequence through Mathematics 51.

Introductory Programming:

- CS 106A-B. Programming Method/Abstractions 10
- or CS 106X. Programming Method/Abstractions (Accelerated) 5

(4) Credit may be used to fulfill this requirement)

Core:

- CS 103A. Discrete Mathematics for CS
- CS 103B. Discrete Structures
- CS 107. Programming Paradigms
- CS 108. Object-Oriented Systems Design

Electives:

- Select two courses from different areas.

Systems:

- CS 140. Operating Systems
- CS 143. Compilers
- CS 145. Databases
- CS 148. Graphics

Theory:

- CS 154. Automata and Complexity Theory
- CS 157. Logic and Automated Reasoning
- CS 161. Design and Analysis of Algorithms

Artificial Intelligence:

- CS 121. Introduction to Artificial Intelligence
- CS 221. AI: Principles and Techniques

Numerical Computing:

- CS 137. Introduction to Scientific Computing

Human-Computer Interaction:

- CS 147. Introduction to Human-Computer Interaction Design

Note: for students with no programming background and who begin with CS 106A, the minor consists of eight courses.

ELECTRICAL ENGINEERING (EE)

Courses fulfilling the minor are from any of the following three tracks.

Option I:

- Engr. 40. Introductory Electronics
- EE 101. Circuits and Systems I
- EE 102. Circuits and Systems II
- EE 103. Introduction to Signal Processing

Four graded EE courses of level 100 or higher

Option II:

- Engr. 40. Introductory Electronics
- EE 101. Circuits and Systems I
- EE 111. Electronics I
- EE 112. Electronics II

Four graded EE courses of level 100 or higher

Option III:

- Engr. 40. Introductory Electronics
- EE 121. Digital Design Laboratory
- EE 181. Introduction to Computer Systems and Assembly Language Programming (enroll in CS 110)
- EE 182. Computer Organization and Design

Four graded EE courses of level 100 or higher
ENVIRONMENT ENGINEERING

The Environment Engineering minor is intended to give students a broad introduction to one or more areas of Environmental Engineering and Science, Environmental Fluid Mechanics and Hydrology, and Energy Engineering. Departmental expertise and undergraduate course offerings are available in the areas of Environmental Engineering. The necessary prerequisites for an engineering minor are Physics 41 and Mathematics 41, 42, and 51. Students should recognize that a minor in Environmental Engineering is not an ABET-accredited degree program. Since undergraduates having widely varying backgrounds may be interested in obtaining an environmental engineering minor, no single set of course requirements is appropriate for all students. Instead, interested students are encouraged to propose their own set of courses within the guidelines listed below; this list must be officially approved by the Civil and Environmental Engineering (CEE) undergraduate minor advisor. Additional information on preparing a minor program, including “example” programs focusing on each of the areas of expertise listed above, is available in the CEE office (Terman M-42). While each example program focuses on a different area of expertise within the department, other combinations of courses are also possible.

General guidelines are:
1. An Environmental Engineering minor must contain at least 24 units of course work not taken for the major, and must consist of at least six classes.
2. The list of courses must represent a coherent body of knowledge in a focused area, and should include classes that build upon one another.
3. Professor Street (Terman M-17; phone, 3-4969; e-mail street@ce) is the CEE undergraduate minor advisor, and provides guidance and advice. Students must consult with Professor Street in developing their minor program, and obtain approval of the finalized study list from him.

MANAGEMENT SCIENCE AND ENGINEERING (MS&E)

The following courses fulfill the minor requirements.

**Background requirements:**
- MS&E 120 or Stat. 116 (recommended)
- Math. 43 or Econ. 180
- Stat. 110 or 190

**Minor requirements:**
- Engr. 62. Introduction to Optimization
- Engr. 60. Engineering Economy (prerequisite: Math. 41)
- MS&E 121. Introduction to Stochastic Processes and Models (prerequisite: MS&E 120 or Stat. 116)
- MS&E 180. Organizational Behavior
- MS&E 169. Quality Assurance and Control (prerequisites: probability and statistical methods)
- MS&E 164. Manufacturing System Design (prerequisites: MS&E 169, 180)
- MS&E 140. Industrial Accounting (or Econ. 90 and 91)
- MS&E 160. Analysis of Production and Operational Systems (prerequisites: probability and Engr. 62)

**Materials Science and Engineering (MSE)**

A minor in Materials Science and Engineering allows interested students to explore the role of materials in modern technology and to gain an understanding of the fundamental processes that govern materials behavior.

The following courses fulfill the minor requirements.

**Fundamentals:**
- Engr. 50. Introductory Science of Materials
- MSE 151. Microstructure and Mechanical Properties
- MSE 152. Electronic Materials Engineering

**Electives (four courses from the MSE Core, 16 units):**
- MSE 191. Mathematical and Computational Methods in Materials Science
- MSE 192. Solid State Thermodynamics
- MSE 193. Atomic Arrangements in Solids
- MSE 194. Phase Equilibria
- MSE 195. Waves and Diffraction in Solids
- MSE 196. Imperfections in Crystalline Solids
- MSE 197. Rate Processes in Materials
- MSE 198. Mechanical Properties of Materials
- MSE 199. Electrical and Magnetic Properties of Solids

**Mechanical Engineering (ME)**

The following courses fulfill the minor requirements.

**General Minor**—This minor aims to expose students to the breadth of ME in terms of topics and of analytic and design activities. The minor consists of seven courses totaling 26 to 28 units. Prerequisites are Mathematics 41, 42; Physics 41.

- Engr. 15. Dynamics
- Engr. 30. Engineering Thermodynamics
- ME 33. Introductory Fluids Engineering
- ME 101. Visual Thinking
- Plus two of the following:
  - ME 103. Manufacturing and Design
  - ME 111. Stress, Strain, and Strength
  - ME 131A. Heat Transfer
  - ME 161. Dynamic Systems

**Thermosciences**—This minor consists of seven courses totaling 26 units. Prerequisites are Mathematics 41, 42, 43; Physics 41.

- Engr. 15. Dynamics
- ME 111. Stress, Strain, Strength
- ME 112. Mechanical Systems
- Plus two of the following:
  - ME 99. Mechanical Dissection
  - ME 101. Visual Thinking
  - ME 103. Manufacturing and Design
  - ME 113. Engineering Design
  - ME 117. Introduction to Sensors
  - ME 118. Introduction to Mechatronics

**Graduate Programs**

**Admission**

Application for admission with graduate standing in the school should be made to the department’s graduate admissions committee. While most graduate students have undergraduate preparation in an engineering curriculum, it is feasible to enter from other programs, including chemistry, geology, mathematics, or physics.

**Fellowships and Assistantships**—Departments and divisions of the School of Engineering award graduate fellowships, research assistantships, and teaching assistantships each year. Information and application forms may be obtained from the chair of the appropriate department or division.

**Registration**—New graduate students should follow procedures for registration as listed in the University’s quarterly Time Schedule. Adviser assignments can be obtained from department offices.

**The Honors Cooperative Program**

A number of industrial firms, government laboratories, and other organizations participate in the Honors Cooperative Program (HCP), a program that permits qualified professional employees of member companies to register for Stanford courses and obtain a graduate degree on a part-time basis.

The courses are offered by the School of Engineering on campus or through the Stanford Instructional Television Network (SITN). SITN broadcasts approximately 200 courses a year over a five-channel system to 250 corporate sites in the San Francisco and Silicon Valley area. This program enables students to receive live courses and interact by means
of a telephone talkback system from their corporate location. Students outside the local broadcast range may pursue their graduate degree by participating in SITN’s TUTored Videotape Instruction (TVI) Program. SITN offers additional programs to member companies such as Non-Credit Option (NCO), Audit Option, several certificate programs, short courses, and course licensing. For a full description of educational services provided by SITN, telephone (650) 725-3000; fax (650) 725-2868; write 401 Durand Bldg., Stanford, CA 94305-4036; or send electronic mail to na.tvt@for sythe.stanford.edu.

ENGINEERING BIOLOGY AND MEDICINE

Stanford does not have a formal department of bioengineering; however, there are several faculty in the School of Engineering whose primary research activities are in this general area. There are many opportunities in the medical and biological sciences for collaboration. Individually designed B.S. majors in bioengineering can be arranged. The faculty working in bioengineering are in various departments of the School of Engineering; a list of their names, together with a summary of their research interests, is available from the committee chair.

Students interested in pursuing graduate study in bioengineering apply for admission and financial aid to the appropriate department on the grounds of their previous training and future interests. Their applications are judged on substantially the same ground as other applicants to the department.

In addition to the standard engineering department degrees, the degree of MSE: Biomechanical Engineering is offered. Details on this program and subsequent Ph.D. studies can be obtained from the Biomechanical Engineering Division, Department of Mechanical Engineering.

The research being conducted in the field of bioengineering within the various departments reflects the technological emphasis of those departments. For instance, research on factors that influence growth and product formation in genetically engineered mammalian cells, immobilized microbial cell function and physiology in compact bioreactors, protein absorption from sheared suspensions onto polymer films, and protein conformation at fluid/polymer interfaces is pursued in the Department of Chemical Engineering. Faculty in Mechanical Engineering are doing research on aids for the disabled, bone mechanics, the mechanics of hearing, neuromuscular dynamics, orthopedic biomechanics, and rehabilitation engineering. Cardiovascular dynamics and hemodynamics are being studied in Computer Science. In Electrical Engineering, advanced analysis techniques are applied to signal processing EKG, EEG, and x-ray image. Many research projects are carried out in collaboration with faculty of the Medical School or members of the local medical community.

Both the master’s and the Ph.D. degrees are ordinarily awarded by a particular department, and the candidate must meet the degree requirements of that department. The student’s adviser assists in constructing a program of study incorporating appropriate courses in biology and medicine that also satisfy the degree requirements of the department in which the student is registered.

A student wishing to earn the M.S. in Engineering while pursuing the M.D. degree must apply separately for admission to the M.D. program and an engineering department. If the student is admitted to both, each school will encourage his or her pursuit of the other degree.

In addition to the financial support available through the departments in the form of fellowships, research assistantships, and teaching assistantships, there are externally administered fellowship programs for the support of graduate study in health-related fields. In particular, both the National Institutes of Health and the National Science Foundation offer such fellowships based on national competition.

MANUFACTURING

Programs in manufacturing are available at the undergraduate, master’s, and Ph.D. level. Master’s programs are offered by the departments of Civil and Environmental Engineering, Management Science and Engineering (MS&E), and Mechanical Engineering. The Manufacturing Systems Engineering program is jointly offered by MS&E and Mechanical Engineering. The M.B.A./Manufacturing Systems Engineering Dual Degree program is offered by the School of Engineering and Graduate School of Business in partnership. The Construction Engineering and Management program, offered by the Department of Civil and Environmental Engineering, is also a “manufacturing” program for students interested in facility and public works manufacturing. All of these programs take advantage of modern computer technology.

Doctrinal programs related to manufacturing are available in a number of departments and involve research projects ranging from machine tool design to the integration of databases into production software.

The Future Professors of Manufacturing (FPM) program prepares graduates for university faculty careers with an emphasis on manufacturing. Candidates are first admitted to a Ph.D. program in a department of the School of Engineering or the Graduate School of Business, and then interested students may be nominated for the FPM program by the department.

For detailed information about the master’s and Ph.D. programs, see the sections of this bulletin pertaining to industrial, mechanical, and civil and environmental engineering. For more information on the Manufacturing Systems Engineering program, contact the Design Division of Mechanical Engineering. For information on the M.B.A./Manufacturing Systems Engineering Dual Degree program and the FPM Ph.D. program, contact the Alliance for Innovative Manufacturing at Stanford (AIM). Inquiries by email may be addressed to sima-info@simas.stanford.edu. For more information on manufacturing research and education in Engineering, browse the AIM Web pages at http://www-sima.stanford.edu/ and the Web pages for departments.

CURRICULA

For further details about the following programs, see the department sections in this bulletin.

Related aspects of particular areas of graduate study are commonly covered in the offerings of several departments and divisions. Graduate students are encouraged, with the approval of their department advisers, to select courses in departments other than their own to achieve a broader appreciation of their field of study. For example, most departments in the school offer courses concerned with properties of materials, and a student interested in an aspect of materials engineering can often gain appreciable benefit from the related courses given by departments other than her or his own.

Departments and divisions of the school offer graduate curricula as follows.

AERONAUTICS AND ASTRONAUTICS

The current research and teaching activities cover a number of advanced fields, with special emphasis on:
- Active Noise Control
- Aerodynamic Noise
- Aeronautics
- Aircraft Design, Performance, and Control
- Applied Aerodynamics
- Biomedical Mechanics
- Computational Aero-Acoustics
- Computational Fluid Dynamics
- Control of Robots, including Space and Deep-Underwater Robots
- Conventional and Composite Structures/Materials
- Direct and Large Eddy Simulation of Turbulence
- High-Lift Aerodynamics
- Hypersonic and Supersonic Flow
- Inertial Instruments
- Multidisciplinary Design Optimization
- Navigation Systems (especially GPS)
- Optimal Control, Estimation, System Identification
- Physical Gas Dynamics
- Robust Control of Flexible Spacecraft
- Spacecraft Design and Satellite Engineering
- Shock Tube Studies of Vortex Interactions
- Turbulent Flow and Combustion
CHEMICAL ENGINEERING
Applied Statistical Mechanics
Biocatalysis
Biochemical Engineering and Biophysics
Computational Materials Science
Colloid Science
Dynamics of Complex Fluids
Hydrodynamic Stability
Kinetics and Catalysis
Newtonian and Non-Newtonian Fluid Mechanics
Polymer Physics
Protein Biotechnology
Semiconductor Processing
Surface and Interface Science

CIVIL AND ENVIRONMENTAL ENGINEERING
Construction Engineering and Management
Design/Construction Integration
Environmental and Water Studies
  Environmental Engineering and Science
  Environmental Fluid Mechanics and Hydrology
Structural Engineering and Geomechanics
  Geomechanics
  Structural Engineering

COMPUTER SCIENCE
Analysis of Algorithms
Artificial Intelligence
Automated Deduction
Autonomous Agents
Compilers
Complexity Theory
Computational Geometry
Computer Architecture
Computer Graphics
Computer Security
Computer Vision
Database Systems
Design Automation
Digital Libraries
Distributed and Parallel Computation
Formal Verification
Haptic Display of Virtual Environments
Human-Computer Interaction
Image Processing
Knowledge-Based and Expert Systems
Knowledge Representation and Logic
Mathematical Theory of Computation
Multi-Agent Systems
Networks, Internet Infrastructure, and Distributed Systems
Operating Systems
Programming Systems/Languages
Reasoning under Uncertainty
Robotics
Scientific Computing and Numerical Analysis
Software Engineering

ELECTRICAL ENGINEERING
Computer Hardware
Computer Software Systems
Control and Systems Engineering
Communication Systems
Electronic Circuits
Electronic Devices, Sensors, and Technology
Fields, Waves, and Radioscience
Lasers, Optoelectronics, and Quantum Electronics
Network Systems
Image Systems
Signal Processing
Solid State Materials and Devices
VLSI Design

ENGINEERING
Interdepartmental Programs
Interdisciplinary Programs

ENGINEERING IN BIOLOGY AND MEDICINE
Biostatistics
Design for Medical Applications
Information Processing in and for Biomedical Systems
Mechanics of Hearing
Medical Imaging
Neuromuscular Biomechanics
Orthopedic Biomechanics
Rehabilitation Engineering
Transport Phenomena in Biological Systems

MANAGEMENT SCIENCE AND ENGINEERING
Decision and Risk Analysis
Dynamic Systems
Economics
Entrepreneurship
Finance
Information
Marketing
Optimization
Organization Behavior
Organizational Science
Policy
Production
Stochastic Systems
Strategy

MATERIALS SCIENCE AND ENGINEERING
Biomaterials
Ceramics and Composites
Computational Materials Science
Design/Manufacturing
Electrical and Optical Behavior of Solids
Electron Microscopy
Fracture and Fatigue
Imperfections in Crystals
Kinetics
Magnetic Behavior of Solids
Magnetic Storage Materials
Phase Transformations
Physical Metallurgy
Solid State Chemistry
Structural Analysis
Thermodynamics
Thin Films
X-Ray Diffraction

MECHANICAL ENGINEERING
Biomechanics
Combustion Science
Computational Mechanics
Controls
Design of Mechanical Systems
Dynamics
Environmental Science
Experimental Stress and Analysis
Fatigue and Fracture Mechanics
Finite Element Analysis
Fluid Mechanics
Heat Transfer
The program of study must satisfy the student's department and usually receives letter grades, (3) the program must include a total of at least 45 units. Each student's program is administered by the particular department. (1) the student's program must be a coherent one with a well-defined objective and must be approved by a department within the school, (2) the student's program must be a coherent one with a well-defined objective and must be approved by a department within the school, (3) the program must include a total of at least 45 units. Each student's program is administered by the particular department in which it is lodged and must meet the standard of quality of that department.

Applications for admission should indicate the department in the school in which the student expects to take most of her or his courses. Transfer into this program is also possible from any program within the school by application to the appropriate department.

The degree of Engineer is awarded at the completion of a comprehensive two-year program of graduate study. It is intended for students who desire more graduate training than can be obtained in an M.S. program. The program of study must satisfy the student’s department and usually includes 90 units beyond the B.S. degree, of which at least 60 must be devoted to advanced or graduate study in the major subject or closely related subjects. The presentation of a thesis is required. The University regulations for the Engineer degree are stated in the “Graduate Degrees” section of this bulletin, and further information is found in the individual departmental sections of this bulletin.

Programs leading to the Ph.D. degree are offered in each of the departments of the school. Special Ph.D. programs, which may be interdepartmental in nature (for example, Bioengineering), can be arranged. University regulations for the Ph.D. are given in the “Graduate Degrees” section of this bulletin. Further information is found in departmental listings.

(WIM) indicates that the course meets the Writing in the Major requirements.
15. Dynamics—Application of Newton’s Laws to solve static and dynamic problems, particle and rigid body dynamics, freebody diagrams, writing equations of motion. 2-D and 3-D cases including gyroscopes, spacecraft, rotating machinery. Solution of equations of motion and dynamic response of simple mechanical systems. Problem sessions. Prerequisites: Mathematics 23 or 43, Physics 41. GER:2b (DR:6)
   5 units, Aut (Rock)
20. Introduction to Chemical Engineering—Overview of chemical engineering through discussion and engineering analysis of physical and chemical processes. Topics: overall staged separations, material and energy balances, concepts of rate processes, energy and mass transport, and kinetics of chemical reactions. Applications of these concepts to areas of current technological importance: biotechnology, production of chemicals, materials processing, and purification. Prerequisite: Chemistry 31. GER:2b (DR:6)
   3 units, Spr (Robertson)
25. Biotechnology—The interplay between applied recombinant DNA technologies and engineering principles in designing, developing, manufacturing, and formulating novel drugs for therapeutic purposes. Emphasis is on understanding the role of engineering in modern biotechnology. Case study perspective. A drug is identified and tracked from the initial phases of drug discovery, to sequencing, cloning, scale-up in cell culture, purification and separation, and formulation. Regulatory issues in manufacturing and in clinical trials. Project-oriented. Recommended: some prior exposure to chemistry and biology. GER:2b (DR:6)
   3 units, Aut (Robertson)
30. Engineering Thermodynamics—Introduction to the concepts of energy and entropy from elementary considerations of the microscopic nature of matter. Use of basic thermodynamic concepts in the solution of engineering problems. Methods and problems in the socially responsible economic generation and utilization of energy in central power stations, solar systems, gas turbine engines, refrigeration devices, automobile engines, etc. Prerequisites: Mathematics 19, 20, 21 or 41, 42, and Physics 41 or equivalent. GER:2b (DR:6)
   3 units, Aut (Mungal)
   Win (Edwards)
40. Introductory Electronics—Overview of electronic engineering. Electrical quantities, and their measurement, including the operation of the oscilloscope. The basic fuction of electronic components including ideal diodes and transistors. Digital logic circuits and their functions including the elementary microprocessor. Analog circuits including the operational amplifier and tuned circuits. Lab assignments complement lecture. Enrollment limited to 200. Lab. May be taken on video at some of Stanford’s Overseas Centers; see “Overseas Studies.” Corequisite: Physics 45. GER:2b (DR:6)
   5 units, Aut (Khuri-Yakub)
   Spr (Staff)
   4 units, Win (Bravman)
   Spr (Sinclair)
60. Engineering Economy—May be taken by freshmen, but recommended for second year or higher students Economic analysis for choice among alternatives. Use of compound interest calculations. Selection of appropriate minimum attractive rates of return. Effects of depreciation, sources of funds, and income tax. Analysis of decisions under uncertain-
   ty. Prerequisite: Mathematics 41 or equivalent. Recommended: previous knowledge of elementary probability.
   3 units, Aut (Jucker)
   Win, Sum (Staff)
62. Introduction to Optimization—Theory and computation of optimal selection of decisions under certainty. Linear programming, network optimization models, dynamic programming, non-linear programming, integer programming. Applications from a variety of areas, emphasizing high-level problems frequently faced by industrial engineers and management scientists. Prerequisite: Mathematics 43 or consent of instructor. GER:2b (DR:6)
   4 units, Aut (Staff)
   Spr (Zelenski)
63Q. Stanford Introductory Seminar: Engineering Applications in Medicine—Preference to sophomores. Introduction to the application of engineering to problems in medicine and health care. Topics: applications of engineering mathematics, systems analysis, and decision analysis to health policy problems; assessment of medical technologies; risk analysis and public policy; computer science applications in medicine; computer science applications in pharmacology; computer science applications in clinical trials. Project-oriented. Recommended: some prior exposure to engineering and medicine. GER:2b (DR:6)
   3 units (Brandeau, Owens)
70A. Programming Methodology—(Enroll in Computer Science 106A.)
   5 units, Aut (Plummer)
   Win (Staff)
   Spr (Roberts)
70X. Programming Methodology and Abstractions (Accelerated)—
   (Enroll in Computer Science 106X.)
   5 units, Aut (Staff)
   Win (Plummer)
   Spr (Zelenski)
100. Teaching Public Speaking—The theory and practice of teaching public speaking and presentation development. Lectures/discussions on developing an instructional plan, using audiovisual equipment for instruction, devising tutoring techniques, and teaching delivery, organization, audience analysis, visual aids, and unique speaking situations. Weekly practice speaking. Students serve as apprentice speech tutors. Those completing course may become paid speech instructors in the Technical Communications Program. Prerequisite: consent of instructor ...
   5 units, Aut, Win, Spr (Lougee, Staff)
102E. Technical/Professional Writing for Electrical Engineers—
   Required of Electrical Engineering majors. The process of writing technical/professional documents. Lecture, writing assignments, individual conferences. Prerequisite: Freshman English. Corequisite: Electrical Engineering 121. (WIM)
   1 unit, Aut, Spr (Lougee)
102M. Technical/Professional Writing for Mechanical Engineers—
   Required of Mechanical Engineering majors. The process of writing technical/professional documents. Lecture, writing assignments, individual conferences. Pre- or corequisite: Mechanical Engineering 103, or consent of instructor. (WIM)
   1 unit, Aut, Win (Lougee)
102S. Writing: Special Projects—Structured writing instruction for students working on non-course related materials (theses, dissertations, journal articles). Weekly individual conferences.
   1-5 units, Aut, Win, Spr (Staff)
102W. Technical and Professional Writing—Explores, systematically, the process of writing technical and professional documents. Lectures/discussions on analyzing audiences; defining purpose; generating and selecting appropriate report materials; structuring and designing clear and convincing reports; drafting effective reports; and editing reports that are clear, concise, emphatic, and mechanically and grammatically “clean.” Weekly writing assignments and individual conferences. Enrollment limited.
3 units, Aut, Win, Spr (Loungee)

103. Public Speaking/Presentation Development—Priority given to Engineering students. Introduction to the full range of speaking activities, from impromptu talks to carefully rehearsed formal professional presentations. How to organize and write speeches for a variety of occasions, analyze audiences, create-and use appropriate visual aids, combat nervousness, and deliver informative and persuasive speeches effectively. Students become confident speakers through weekly practice in class, rehearsals in one-on-one tutorials, and videotaped feedback.
3 units, Aut, Win, Spr (Staff)

3-4 units (Staff) not given 2000-01

3 units, Aut (Enge)
Win (Franklin)

3 units, Aut (Horne)

130. Science, Technology, and Contemporary Society—(Same as Science, Technology, and Society 101.) Analysis of the interplay of science, technology, and society in the contemporary U.S. Topics: the key social, cultural, and values issues raised by contemporary scientific and technological developments; distinctive features of science and engineering as socio-technical activities; major influences of scientific and technological developments on 20th-century society, including transformations and problems of work, leisure, human values, the fine arts, and international relations; ethical conflicts in scientific and engineering practice; and the social shaping and management of contemporary science and technology. Optional section for extra unit. GER:3b (DR:9)
4-5 units, Aut (McGinn)

131. Ethical Issues in Engineering—(Same as Science, Technology, and Society 115.) Ethical issues in contemporary engineering practice. Topics: the moral rights and responsibilities of engineers in relation to society, employers, colleagues, and clients; cost-benefit-risk analysis, safety, and informed consent; the ethics of whistle blowing; ethical conflicts of engineers as expert witnesses, consultants, and managers; ethical issues in engineering design, manufacturing, and operations; ethical issues arising from engineering work in foreign countries; and ethical implications of the social and environmental contexts of contemporary engineering. Use of real-life case studies, guest practitioners, and field research. Limited enrollment. GER:3a (DR:8)
4 units, Spr (McGinn)

140A. Management of Technology Ventures—First of three-credit only for students selected to the Mayfield Fellows Program. Functional management and leadership within high technology startups, focusing on entrepreneurial skills related to product and market strategy, venture financing and cash flow management, team recruiting and building strategies, and the challenges of managing growth and handling adversity in emerging ventures. Other engineering faculty, start-up founders, and venture capitalists participate as appropriate. No auditors. Recommended: accounting or finance course (Management Science and Engineering 133, Economics 90, or Engineering 60).
4 units, Spr (Byers)

140B. Management of Technology Ventures—Open to Mayfield Fellows only; taken during the summer work tour at a technology startup. Students meet to exchange experiences and continue the formal learning process, and keep a journal of activities. Credit given following quarter. No auditors.
1 unit, Aut (Byers)

140C. Management of Technology Ventures—Open to Mayfield Fellows only. Allows students, faculty, employers, and venture capitalists to share and compare recent co-op experiences and analytical frameworks. Students develop “living” case studies and integrative project reports. No auditors.
3 units, Aut (Sutton)

145. Introduction to High Technology Entrepreneurship—Primarily for undergraduates in engineering; preference to seniors. High-level overview of the entrepreneurial process, enterprise, and individual. For those who would like to form or grow a technology company, and those with a general interest in the field. Weekly assignments, case studies, lectures, and projects. No auditors.
3 units, Win (Byers)

4 units, Aut (Squires)
Spr (Feziger)

4 units, Win (Moin)

159Q. Stanford Introductory Seminar: Research in Japanese Companies—Preference to sophomores. The home-campus equivalent of the Kyoto course. Knowledge from this research, and company visits, is
evaluated in a seminar/discussion setting. Lecture/discussion on the structure of a Japanese company from the point-of-view of Japanese society. Visiting researchers from Japanese companies, with brief presentations and extensive question and answer periods, explore the Japanese research ethic.

3 units, Spr (Sinclair)

199. Special Studies in Engineering—Special studies, lab work, or reading under the direction of a faculty member. Often research opportunities exist in ongoing research projects. Students make arrangements with individual faculty and enroll in the section number corresponding to the particular faculty member. Prerequisite: consent of instructor.

1 or more units, any quarter (Staff)

PRIMARILY FOR GRADUATE STUDENTS

205. Introduction to Control Design Techniques—Review of root-locus and frequency response techniques for control system and analysis, and synthesis. Introduction to: digital control design and the z-transform; state-space techniques modeling, full-state feedback regulator design, pole placement, and observer design. Combined observer and regulator design. Lab experiments on computers connected to mechanical systems. Prerequisites: 105; Mathematics 103, 113. Recommended: knowledge of Matlab.

3 units, Aut (Tomlin)

206. Control System Design and Simulation—Sequel to 105. Analog op-amp circuits are used for simulation and control law implementation. Design of differential actuators and sensors. Model construction techniques. Teams design, build, and test a miniature control system. Emphasis is on qualitative aspects of synthesis, generation of candidate design, and engineering tradeoffs in system selection. Lab. Prerequisite: 105.

4 units, Win (Rock)

207A. Modern Control Design I—Design and analysis of digital controllers using classical and state space techniques. Discretization of continuous systems, z-transforms, and direct digital design. Pole placement and optimal quadratic regulators for single-input/single-output and multiple-input/multiple-output discrete systems. Discrete observers and optimal estimators. Simple lab experiments on mechanical systems. Prerequisites: 205; Mathematics 103 or Mechanical Engineering 200A.

3 units, Win (Lall)

207B. Modern Control Design II—Design of optimal controllers and estimators for systems with stochastic disturbances. Basic probability theory, identification techniques, recursive filtering, duality, and properties of optimal regulators. Sensitivity, robustness, and design trade-offs. Extensions to other cost functions. Lab experiments on computers connected to mechanical systems. Prerequisite: 207A. Recommended: Electrical Engineering 278 or Statistics 116.

3 units, Spr (Tomlin)

3 units, Tomlin

209B. Advanced Nonlinear Control—Second of series in nonlinear systems. Introduction to differential geometry. Input/output analysis and stability: small gain theorems, passivity theorems, Lure problem. Popov and circle criteria. Geometric nonlinear control. MIMO feedback linearization; backstepping. Design examples from a variety of areas. Prerequisite: 209A.

3 units, Spr (Tomlin)

3 units (Staff) not given 2000-01

3 units (Staff) not given 2000-01

220A. 3 units, Aut (J. Levandosky)
220B. 3 units, Win (J. Levandosky)
220C. 3 units, Spr (Mattingly)

235A,B. Space Systems Engineering—40-50 students, mostly from engineering and science, but also from business and political science, form a team to prepare a preliminary design study of a space system. Recently, international engineers have joined the team to define an initiative to put humans on Mars by 2010. Continued studies with Japan, Russia, and Europe define space vehicles for the missions. About 20 invited speakers from government and industry give the necessary background information. At the end of the second quarter, the class gives a verbal briefing to government and industry representatives and publishes a final report on the system. Prerequisite: senior or graduate standing in Engineering or Physics, or consent of instructor.

235A, 3 units, Win (Lusignan)
235B. 3 units, Spr (Lusignan)

251. Research Writing and Review—Seminar. Students participate in the Creating Research Examples Across the Teaching Enterprise (CREATE) writing program. The goal is to have students produce, through a peer reviewed process, 1,000 word statements describing their research in ways that are understandable and compelling to undergraduates and other novices in the field. Unit credit when the final approved statements appear on the CREATE web site.

1 unit, Win, Spr (Reis)

290. Graduate Environment of Support: Tutorial and Learning Strategies—Discussion by guest faculty, advanced graduate students, specialists from industry and government, and the dean’s office. Topics and information are related to adapting graduate study to the environment in terms of psychosocial, financial, and career issues. How these relate to diversity, affirmative action and minority services, resources, policies, and procedures. Readings and observation participation sessions. (AU)

1 unit, Aut, Win, Spr (Reis)

297A,B,C. Ethics of Development in a Global Environment (EDGE)—(Same as Cultural and Social Anthropology 133A,B,C.) Wednesday evening seminars on world affairs mostly on issues affecting poor nations. Autumn Quarter treats war and peace: the background of current wars and peace negotiations, the UN peacekeeping efforts, war and religion, arms trade. Winter Quarter treats international resources and commerce: the debt crisis, environmental protection, resource depletion, Japan in the world economy, aid and monetary institutions. Spring Quarter treats “poverty and prejudice”: development models, comparative national health, AIDS, control of wealth, India-China-Africa-S. America today. Speakers from Stanford and other institutions are experts
298. Seminar in Fluid Mechanics—Interdepartmental seminar on problems in all branches of fluid mechanics, with talks by visitors, faculty, and students. Graduate students may register for 1 unit, without letter grade; a letter grade is given for talks. (AU)

1 unit, Aut (Shaafeh)
Win (Moin)
Spr (Durbin)

299. Special Studies in Engineering—Special studies, lab work, or reading under the direction of a faculty member. Students enroll in the section number corresponding to the particular faculty member. Prerequisite: consent of the instructor.

1 or more units, any quarter (Staff)

310A. Tools for Team-Based Design—(Same as Mechanical Engineering 310A.) For graduate students; open to limited SITN/global enrollment. Project-based, exposing students to the tools and methodologies useful for forming and managing an effective engineering design team in a business environment, including product development teams that may be spread around the world. Topics: personality profiles for creating teams with balanced diversity; computational tools for project coordination and management; real time electronic documentation as a critical design process variable; and methods for refining project requirements to ensure that the team addresses the right problem with the right solution. Computer-aided tools are employed for supporting geographically distributed teams. The final project analyzes a set of industry-sponsored design projects for consideration in 310B,C. The investigation includes benchmarking and meetings with industrial clients. The deliverable is a detailed document with specifications for the project and the optimal design team that should work on the project in subsequent quarters. Limited enrollment, consent of instructor for off-campus (global) registrants.

4 units, Aut (Cutkosky)

310B,C. Design Project Experience with Corporate Partners—(Same as Mechanical Engineering 310B,C.) Two-quarter project for graduate students who already have some design experience and want in-depth involvement in an entrepreneurial design team with real world industrial partners. The products developed are part of the student’s portfolio. For some projects, 217 and 218 may be prerequisites or co-requisites (see http://me310.stanford.edu for admission guidelines). Each team functions like a small start-up company, working closely with a technical advisory board, consisting of the instructional staff and a coach. Teams use computer-aided tools for project management, communication, and documentation, and are provided a budget for direct expenses including hiring technical assistants and conducting tests. Teams interact with corporate liaisons weekly via site visits, video conferencing, email, fax, and phone. Hardware demonstrations, peer reviews, scheduled documentation releases, and an intense team environment provide the mechanisms and culture for design information sharing. Enrollment by consent of instructor and depends on the results of a pre-enrollment survey in December and the recommendations made by project definition teams in 310A.

4-5 units Win, Spr (Cutkosky)

610. Manufacturing Systems Analysis—(Same as Business T610.) Causal models of material flow in manufacturing systems. Topics: capacity and capacity utilization; functions of inventory; the manufacturing enterprise as a linear economic system; product structure and requirements planning; models of manufacturing response time; product portfolios and manufacturing flexibility. Emphasis is on descriptive modeling.

4 units (Harrison)

611. Understanding Manufacturing Processes—(Same as Business T611.) Provides a framework for understanding the technology of modern manufacturing processes, focusing on the key factors in developing an understanding of any manufacturing process. Topics include underlying microscopic physical and analytical theories; steps that control the performance, quality, and cost of the product; the history of the process; and the potential for improvement through research. Examples of fabrication processes (e.g., semiconductor devices, precision machining).

4 units (Cutkosky, Wood)

612. Manufacturing Organization—(Same as Business T612.) Overview of organization theory, research, and research methods relevant to the study of manufacturing systems. Conceptual domains include selection, socialization, promotion systems, reward systems, job design, creativity, innovation, social networks, group problem-solving, and the relationship between technology and social structure. Research focuses on papers that used organizational theory and methods to understand behavior of, and in, manufacturing settings.

4 units (Staff) given 2001-02

613. Design for Manufacturability—(Same as Business T613.) Structured methodologies of the DFM process, emphasizing the pivotal role of design in manufacturing effectiveness. Topics: the initial stages of the concurrent engineering process including functional analysis, benchmarking, quality function deployment, value analysis, cost drivers, design for assembly and serviceability, design for process, and advanced research issues on these topics. Projects involve independent study of the design and manufacture of a product currently in production leading to a new product definition offering improved competitive advantage.

4 units (Ishii)

614. Manufacturing Performance Measurement—(Same as Business T614.) Managerial accounting as a discipline is devoted to modeling manufacturing processes and representing physical events in economic terms: fundamental issues in measurement theory, cost-volume-profit analysis, activity-based costing, variance analysis, and the costs and benefits of flexibility. Finance functions: capital investment in technology, interactions with the financial markets, capital structure, and taxation. Quality, where modeling of economic effects is a relatively recent phenomenon: statistical process control, cost of quality measures, ISO 9000, the Baldrige Award process, and environmental protection.

4 units (Patelli)

615. Manufacturing Information and Coordination—(Same as Business T615.) Systems for sharing information, coordinating activities, and aligning different objectives in a manufacturing organization. Cross-functional coordination, goal conflicts among agents, design of incentives, resource allocation. The information systems that support coordination activities through a value delivery chain (systems for order entry, master scheduling, requirements planning, product scheduling, and material flow control).

4 units (Whang)

616. Proseminar in Manufacturing Education—(Same as Business T616.) Primarily for the Future Professors of Manufacturing, but open to others with consent of the instructor. Students are exposed to manufacturing topics not covered in traditional courses and which are needed to help them prepare for academic careers in manufacturing. Topics are chosen by the students, who develop many of the presentations and lead many of the discussions. Guest speakers from government, industry, and academia.

1 unit, Aut, Win, Spr (Reis)

OVERSEAS STUDIES

These courses are approved for the School of Engineering and taught overseas at the campus indicated. Students should discuss with their major department adviser which courses would best meet individual needs. Descriptions are in the “Overseas Studies” section of this bulletin or at
the Overseas Studies office, 126 Sweet Hall. Students overseas are also encouraged to participate in an internship as part of their international experience.

BERLIN

40B. Introductory Electronics
5 units, Aut, Win, Spr (Masters)

50B. Introductory Science of Materials
4 units, Aut, Win, Spr (Bravman)

FLORENCE

50F. Introductory Science of Materials
4 units, Aut, Win (Bravman)

KYOTO

AERONAUTICS AND ASTRONAUTICS

Chair: George S. Springer
Associate Chair: Brian J. Cantwell
Professors: Brian J. Cantwell, Fu-Kuo Chang, Antony Jameson, Ilan Kroo, Robert W. MacCormack, Bradford W. Parkinson, George S. Springer, Charles R. Steele
Associate Professors: Per Enge, Sanjiva Lele, Stephen Rock
Assistant Professors: Juan Alonso, Sanjay Lall, Claire Tomlin
Professors (Research): Richard Christensen, Stephen W. Tsai
Lecturer: Thomas H. Pulliam
Consulting Professors: Ronald K. Hanson, Lambertus Hesselink
Consulting Professors: David Altman, Cynthia H. Null, Bernard Ross, Robert Twigg
Consulting Associate Professor: Jonathan How

The current research and teaching activities cover a number of advanced fields, with special emphasis on:
Active Noise Control
Aerodynamic Noise
Aeroelasticity
Aircraft Design, Performance, and Control
Applied Aerodynamics
Biomedical Mechanics
Computational Aero-Acoustics
Computational Fluid Dynamics
Control of Robots, including Space and Deep-Underwater Robots
Conventional and Composite Materials and Structures
Direct and Large-Eddy Simulation of Turbulence
High-Lift Aerodynamics
Hypersonic and Supersonic Flow
Inertial Instruments
Multidisciplinary Design Optimization
Navigation Systems (especially GPS)
Optical Diagnostics in Fluid Dynamics
Optimal Control, Estimation, System Identification
Physical Gas Dynamics
Robust Control of Flexible Spacecraft
Shock Tube Studies of Vortex Interactions
Spacecraft Design and Satellite Engineering
Turbulent Flow and Combustion

INSTRUCTION AND RESEARCH FACILITIES

The work of the department is centered in the William F. Durand Building for Space Engineering and Science. This 120,000 square foot building houses advanced research and teaching facilities and concentrates in one complex the Department of Aeronautics and Astronautics as well as the activities of other engineering organizations allied in space exploration and aerospace technology.

The Global Positioning System (GPS) Laboratory is engaged in research on precise aircraft, spacecraft, and ground vehicle navigation. The laboratory has extensive equipment including approximately 30 carrier phase receivers and has built approximately 20 pseudolites for centimeter level positioning research both inside and outside buildings. A nationwide network of reference stations has been installed for evaluation of the Wide Area Differential GPS concept. The laboratory has performed extensive flight testing in a twin engine aircraft at local airports.

The Aerospace Robotics Laboratory (ARL) is developing advanced robot systems and control techniques applicable to industrial automation and space and underwater robotics. Experimental research facilities include very-flexible-beam manipulators, SCARA-configured manipulators with flexible drive trains, quick mini-manipulators, and pairs of cooperating manipulators. A collection of model free-flying space robots that experience the dynamics of space through the use of air-cushion support systems makes possible leading-edge research in space-manipulator system dynamics. Object-based control puts the human operator at the task command level. ARL works closely with the Computer Science Robotics Laboratory on task-planning/task-execution systems and with the GPS Laboratory on the navigation and control of autonomous systems.

The ARL computing facilities include a dozen Sun workstations for control system design, analysis, and simulation; for real-time software development; for mechanical and electrical CAD; and for documentation. The workstations are complemented by a collection of real-time control computers networked by the labwide LAN. These microprocessor-based, single-board computers are used in multiprocessor configurations for implementing and testing control algorithms on experimental hardware.

The Guidance and Control Laboratories include a wide spectrum of specialized facilities for making and testing novel instruments of extremely high precision. In addition, students work in laboratories associated with interdepartmental science experiments such as Gravity Probe-B (a gyro test of general relativity), a Space Test of the Equivalence Princi-
ple, and an advanced Laser Interferometer Gravity-wave Observatory. Clean facilities, ultra-precision machining, and advanced electronics design and fabrication support the guidance, control, and instrumentation experiments and research in precision machining; for example, quiet hydraulics for actuation and metrology on machines expected to operate with 30 nm precision. Cryogenic gyro test facilities are available in the nearby Varian Physics Building, and Electrical Engineering’s Integrated Circuit Fabrication Facility is adjacent.

The spacecraft design program is a total life-cycle space mission program. The Satellite Systems Development Laboratory (SSDL) provides the opportunity for building, testing, and operating low earth-orbiting microsatellites. Students at the master’s degree level participate in mission planning, project management, spacecraft design, fabrication, testing, launch integration, and mission operations. Students in the engineer and doctoral programs are involved with multiyear satellite programs for more complex missions. These programs involve direct interaction with payload customers and industry in both design and operations.

The Aircraft Aerodynamics and Design Group is involved with research in applied aerodynamics and aircraft design. Their work ranges from the development of computational and experimental methods for aerodynamic analysis to studies of unconventional aircraft concepts and new architectures for multidisciplinary design optimization.

The Flow Physics and Computation Division (FFC) is a joint laboratory between the departments of Aeronautics and Astronautics, and Mechanical Engineering. The FFC offers courses in aerodynamics, applied mathematics, compressible flow, computational fluid mechanics, numerical analysis, and propulsion.

The goal of the FFC is to carry out basic research leading to the development of improved computational tools and physical models for accurate engineering design, analysis, and control of complex flows. Problems of interest include aerodynamics, electronic cooling, material processing, planetary entry, power systems, propulsion, and semiconductor manufacturing. Research is conducted in a variety of disciplines including acoustics, chemical reactions, combustion, data display, environmental fluid mechanics, flow control, flow interactions with electromagnetic waves, numerical analysis, plasmas and processing, and scientific computing.

The computational facilities of the FFC include powerful workstations, color displays and reproduction facilities, and direct access to the major national computing facilities of the nearby NASA-Ames Research Center which includes CRAY-C90s and massively parallel supercomputers. The Center for Turbulence Research (CTR), a research consortium between Stanford and NASA, is affiliated with this group. The intellectual atmosphere of the Flow Physics and Computation Division is greatly enhanced from interactions with CTR’s large staff of postdoctoral researchers and distinguished visiting scientists.

Experimental fluid mechanics research is carried out using the facilities of the Aero-Fluid Mechanics Laboratories (AFML). Facilities include several laser sources and flow measuring systems; a high pressure shock tube; a flow visualization water channel; and a temperature stabilized subsonic wind tunnel equipped with a unique free-to-roll, free-to-yaw high angle-of-attack model support system. Collaborative projects with NASA-Ames provide Stanford faculty and graduate students access to a variety of large-scale experimental flow facilities. Research is directed at using experimentation to enhance a basic understanding of fluid flow phenomena with application to aeronautical systems including the aerodynamics of high lift systems, new propulsion concepts, and advanced aerodynamic measurement techniques.

The Structures and Composites Laboratories include facilities for studying and testing the behavior of small-scale structures of metal and fiber reinforced composites. Equipment is also available to fabricate structural elements made of composite material using an autoclave, resin transfer molding, and hot press.

The department has over 100 computers in the Durand Building for use in the academic and research programs. Two clusters of Macintoshes and PCs are available for student use, and each research group is equipped with advanced workstations, Macintoshes, and/or PCs. In addition, computer clusters throughout the campus provide access to electronic mail, the WorldWide Web, and time-shared computation via the campus academic computer network. They are available to all students at no cost for their course work or unsponsored research.

The Durand Building also houses faculty and staff offices and several conference rooms. Attached to the building is a modern classroom building equipped for televising lectures; it contains a lecture auditorium.

The Center for Turbulence Research (CTR) is a research consortium for fundamental study of turbulent flows, jointly operated by Stanford and NASA-Ames Research Center. Its principal objective is to stimulate significant advances in the physical understanding of turbulence, leading to improved capabilities for control of turbulence and turbulence modeling for engineering analysis. Emphasis is placed on probing turbulent flow fields, developed by direct numerical simulations and/or laboratory experiments using new diagnostic techniques and mathematical methods, and on concepts for turbulence control and modeling. Although the role of the CTR is to advance the understanding of turbulent flows for aerospace applications, it is an interdisciplinary program; researchers with interest in turbulence are sought from aeronautics, mathematics, meteorology, oceanography, physics, and other areas.

GENERAL INFORMATION

Further information about the facilities and programs of the Department of Aeronautics and Astronautics is available on the World Wide Web (at http://aa.stanford.edu/) or by request from the department’s Student Services office.

The department has a very active student branch of the American Institute of Aeronautics and Astronautics, which sponsors films covering aerospace topics and monthly socials. It also conducts visits to nearby research, government, and industrial facilities, and sponsors a Young Astronauts Program in the local schools.

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

Although primarily a graduate-level department, Aeronautics and Astronautics offers an interdisciplinary program in Aeronautics and Astronautics (AA) leading to the B.S. degree in Engineering. For further information, see the “School of Engineering” section of this bulletin and the Undergraduate Handbook, available from the Office of the Dean of Engineering.

Undergraduates interested in aerospace may also elect a minor in Aeronautics and Astronautics. For information about an AA undergraduate minor, see the “School of Engineering” section of this bulletin.

COTERMINAL PROGRAM

This special program allows Stanford undergraduates an opportunity to work simultaneously toward a B.S. in another field and an M.S. in Aeronautics and Astronautics. General requirements for this program and admissions procedures are described in the “School of Engineering” section of this bulletin. Admission is granted or denied through the departmental faculty Admissions and Awards Committee. A coterminal
student must meet the course and scholarship requirements detailed for the M.S. below.

GRADUATE PROGRAMS

Admission—To be eligible to apply for admission to the department, a student must have a bachelor’s degree in engineering, physical science, mathematics, or an acceptable equivalent. Students who have not yet received a master’s degree in a closely allied discipline will be admitted to the master’s program; eligibility for the Ph.D. program is considered after the master’s year (see “Doctor of Philosophy” below). Applications for all degree programs are accepted throughout the year, although applications for fellowship aid must be received and completed by January 15 for the next Autumn Quarter.

Information about admission to the Honors Cooperative Program is included in the “School of Engineering” section of this bulletin.

Further information and application forms may be obtained from Graduate Admissions, the Registrar’s Office (http://www.stanford.edu/ dept/registrar/admissions/).

Waivers and Transfer Credits—Students may receive departmental waivers of required courses for the M.S. degree in Aeronautics and Astronautics by virtue of substantially equivalent and satisfactorily performed course work at other institutions. A waiver petition (signed by the course instructor and adviser) should be submitted to the Student Services office indicating (1) the Stanford University course number and title, and (2) the institution, number(s), and title(s) of the course(s) wherein substantially equivalent material was treated. If a waiver is granted, the student may take an additional technical elective in place of the required course. The total 45-unit requirement for the master’s degree is not reduced by course waivers.

A similar procedure should be followed for transfer credits. However, transfer credit is allowed only for courses taken as a graduate student, after receiving a bachelor’s degree, in which equivalence to Stanford courses is established and for which a grade of ‘B’ or better has been awarded. Transfer credits, if approved, will reduce the total number of Stanford units required for a degree. The number of transfer credits accepted for each degree (M.S., Engineer, and Ph.D.) is delineated in the “Graduate Degrees” section of this bulletin.

Fellowships and Assistantships—Fellowships and course or research assistantships are available to qualified graduate students. Fellowships sponsored by Gift Funds, Stanford University, and Industrial Affiliates of Stanford University in Aeronautics and Astronautics provide grants to several first-year students for the nine-month academic year to cover tuition and living expenses. Stanford Graduate Fellowships, sponsored by the University, provide grants for three full years of study and research; each year, the department is invited to nominate several outstanding doctoral or predoctoral students for these prestigious awards. Students who have excelled in their master’s-level course work are eligible for course assistantships in the department; those who have demonstrated research capability are eligible for research assistantships from individual faculty members. A half-time course or research assistantship provides a semi-monthly salary and a 9-unit tuition grant per quarter. Research assistants may be given the opportunity of full-time summer employment at twice the half-time rate. They may use their work as the basis for a dissertation or Engineer’s thesis.

MASTER OF SCIENCE

The University’s basic requirements for the master’s degree are outlined in the “Graduate Degrees” section of this bulletin. Students with an aeronautical engineering background should be able to qualify for the master’s degree in three quarters of work at Stanford. Students with a bachelor’s degree in physical science, mathematics, or other areas of engineering may find it necessary to take certain prerequisite courses, which would lengthen the time required to obtain the master’s degree. The following are departmental requirements.

SCHOLARSHIP REQUIREMENTS

A minimum grade point average (GPA) of 2.75 is required to fulfill the department’s M.S. degree requirements and a 3.0 is the minimum required for eligibility to attempt the Ph.D. qualifying examination. It is incumbent upon both M.S. and potential Ph.D. candidates to request letter grades in all courses except those that do not offer a letter grade option and those that fall into the categories of colloquia and seminars (for example, AA 293, 297, and 298). Insufficient grade points on which to base the GPA may delay expected degree conferral or result in refusal of permission to take the qualifying examinations. Candidates with GPAs of 3.0 through 3.2 must request the permission of the Candidacy Committee to attempt the qualifying examinations.

AERONAUTICS AND ASTRONAUTICS

The master’s program in Aeronautics and Astronautics (AA) is designed to provide a solid grounding in the basic disciplines and a foundation for systems engineering. All candidates for this degree are expected to meet the basic course requirements in experimentation in aeronautics and astronautics, fluid mechanics, guidance and control, propulsion, and structural mechanics (Category A below), in addition to work in applied mathematics (Category B) and technical electives (Category C).

A. Basic Courses—Candidates select eight courses as follows:

1. Five courses in the basic areas of Aeronautics and Astronautics (one each):
   a) Experimentation: 236A or 290; or Engr. 205, 206, or 207A
   b) Fluids: one of 200A, 200B, 210A
   c) Guidance and Control: Engr. 279
   d) Propulsion: 280 or 283
   e) Structures: 240A

2. Three courses, one each from the areas below:
   a) Fluids: 200A or 200B (if 210A was taken or waived in item 1);
     or 210A (if 200A or 200B was taken or waived in item 1)
   b) Structures: 240B or 256
   c) Guidance and Control: 271A or 279
   d) Aero Astro elective: AA course numbered 200 and above, excluding seminars and independent research.

Candidates who believe they have satisfied a Basic Courses requirement in previous study may request a waiver of one or more courses (see “Waivers and Transfer Credits” above). If a requirement in fluids, guidance and control, or structures in item 1 is waived, it is expected that a course in the same category from item 2 will be substituted.

B. Mathematics Courses—During graduate study, each candidate is expected to develop a competence in the applied mathematics pertinent to his or her major field. This requirement can be met by matriculating in a minimum of 6 units in either (1) applied mathematics (for example, complex variables, linear algebra, partial differential equations, probability), or (2) technical electives that strongly emphasize applied mathematics. A list of courses approved for the mathematics requirement is available in the departmental Student Services office. (Calculus, ordinary differential equations, and vector analysis are fundamental mathematics prerequisites, and will not satisfy the master’s mathematics requirement.) Students planning to continue to the Ph.D. should note that 25 percent of the major-field Ph.D. qualifying examination is devoted to pertinent mathematics.

C. Technical Electives—Candidates, in consultation with their advisors, select at least four courses in their major field from among the graduate-level courses offered by the departments of the School of Engineering and related science departments. This requirement increases by one course, taken in either the major or peripheral fields, for each basic course that is waived. Normally, one course (3 units) in this category may be directed research. Courses taken in satisfaction of the other master’s requirements (categories A, B, and D) may not also be counted as technical electives.

D. Other Electives—It is recommended that all candidates enroll in at least one humanities or social science course. Language classes qual-
ify in this category, but practicing courses in, for example, art, music, and physical education do not qualify.

When planning their programs, candidates should check course descriptions carefully to ensure that all prerequisites have been satisfied. A course that is taken to satisfy a prerequisite for courses in Category A (Basic Courses) or B (Mathematics) cannot be counted as a technical elective, but can count toward the M.S. degree in Category D (Other Electives).

ENGINEERING

Students whose career objectives require a more interdepartmental or narrowly focused program than is possible in the M.S. program in Aeronautics and Astronautics (AA) may pursue a program for an M.S. degree in Engineering (45 quarter units). This program is described in the School of Engineering "Graduate Programs of Study" section of this bulletin.

Sponsorship by the Department of Aeronautics and Astronautics in this more general program requires that the student file a proposal before completing 18 units of the proposed graduate program. The proposal must be accompanied by a statement explaining the objectives of the program and how the program is coherent, contains depth, and fulfills a well-defined career objective. The proposed program must include at least 12 units of graduate-level work in the department and meet rigorous standards of technical breadth and depth comparable to the regular AA Master of Science program. The grade and unit requirements are the same as for the M.S. degree in Aeronautics and Astronautics.

ENGINEER

The degree of Engineer represents an additional year (or more) of study beyond the M.S. degree and includes a research thesis. The program is designed for students who wish to do professional engineering work upon graduation and who want to engage in more specialized study than is afforded by the master's degree alone. It is expected that fulltime students will be able to complete the degree within two years of study after the master's degree.

The University’s basic requirements for the degree of Engineer are outlined in the “Graduate Degrees” section of this bulletin. The following are department requirements. The candidate’s prior study program should have fulfilled the department’s requirements for the master’s degree or a substantial equivalent. Beyond the master’s degree, a total of 45 units of work is required, including a thesis and a minimum of 30 units of courses chosen as follows:

1. Twenty-four units of approved electives, of which 9 shall be in mathematics or applied mathematics. The remaining 15 units shall be chosen in consultation with the adviser, and represent a coherent field of study related to the thesis topic. Suggested fields include: (a) acoustics, (b) aerospace structures, (c) aerospace systems synthesis and design, (d) analytical and experimental methods in solid and fluid mechanics, (e) computational fluid dynamics, and (f) guidance and control.

2. Six units of free electives.

3. The remaining 15 units may be thesis, research, technical courses, or free electives.

Candidates for the degree of Engineer are expected to have a minimum grade point average (GPA) of 3.0 for work in courses beyond those required for the master’s degree. All courses except seminars and directed research should be taken for a grade.

DOCTOR OF PHILOSOPHY

The University’s basic requirements for the Ph.D. degree are outlined in the “Graduate Degrees” section of this bulletin. Department requirements are stated below.

Qualifications for candidacy for the doctoral degree are contingent on:

1. Fulfilling department requirements for the master’s degree or its substantial equivalent.

2. Maintaining a high scholastic record for graduate course work at Stanford.

3. Completing 3 units of a directed research problem (AA 290 or an approved alternative).

4. In the first year of doctoral study, passing an oral Ph.D. qualifying examination given by the department during Autumn and Spring quarters.

Detailed information about the nature and scope of the Ph.D. qualifying examination can be obtained from the department. Research on the doctoral dissertation may not be formally started before passing this examination.

Beyond the master’s degree, a total of 90 additional units of work is required, including a minimum of 36 units of approved formal course work (excluding research, directed study, and seminars). The courses should consist primarily of graduate courses in engineering and related sciences, and should form a strong and coherent doctoral program. At least 12 units must be from graduate-level courses in mathematics or applied mathematics (a list of approved courses is available from the department Student Services office). University requirements for continuous registration do apply to doctoral students for the duration of the degree, including registration for each quarter in which the student requires department consultation to complete dissertation work.

University Oral and Dissertation—The Ph.D. candidate is required to take the University oral examination after the dissertation is substantially completed (with the dissertation draft in writing), but before final approval. The examination consists of a public presentation of dissertation research, followed by substantive private questioning on the dissertation and related fields by the University oral committee (four selected faculty members, plus a chair from another department). The University oral normally occurs toward the end of the fourth doctoral year. Once the oral has been passed, the student finalizes the dissertation for reading committee review and final approval. The dissertation reading committee is selected, in consultation with the adviser and subject to the approval of the department chair, during the second year of doctoral study. Forms for the University oral scheduling and a one-page dissertation abstract should be submitted to the department Student Services office at least three weeks prior to the date of the oral for departmental review and approval.

Ph.D. Minor

A student who wishes to obtain a Ph.D. minor in Aeronautics and Astronautics should consult the department office for designation of a minor adviser. A minor in Aeronautics and Astronautics may be obtained by completing 20 units of graduate-level courses in the Department of Aeronautics and Astronautics, following a program (and performance) approved by the department’s candidacy chair.

The student’s Ph.D. reading committee and University oral committee must each include at least one faculty member from Aeronautics and Astronautics.

COURSES

(WIM) indicates that the course meets the undergraduate Writing in the Major requirements.

(AU) indicates that the course is subject to the University Activity Unit limitations for undergraduates (8 units maximum).

100. Introduction to Aeronautics and Astronautics—The principles of fluid flow, flight, and propulsion; the creation of lift and drag, aerodynamic performance including take-off, climb, range, and landing performance, structural concepts, propulsion systems, trajectories, and orbits. Remarks on the history of aeronautics and astronautics. Prerequisites: Mathematics 41, 42; elementary physics.

3 units, Aut (Alonso)

104. Dynamic Behavior—(Enroll in Engineering 104.)

105. Feedback Control Design—(Enroll in Engineering 105.)
190. Directed Research and Writing in Aeronautics and Astronautics—Experimental or theoretical work for undergraduate students, under faculty direction, and emphasizing development of research and communication skills. Written report(s) and letter grade required; if this is not appropriate, enroll in 199. Consult faculty in area of interest for appropriate topics, including one of the graduate research groups or other special projects. Prerequisite: consent of Student Services Manager and instructor. (WIM)

3-5 units, any quarter (Staff)

199. Independent Study in Aeronautics and Astronautics—Directed reading, lab, or theoretical work for undergraduate students. Consult faculty in area of interest for appropriate topics involving one of the graduate research groups or other special projects. Prerequisite: consent of instructor.

1-5 units, any quarter (Staff)

200A. Applied Aerodynamics—Review of the fundamental equations of fluid dynamics and the physical assumptions on which they are based; overview of appropriate methods for solving these equations including nonlinear CFD, conformal mapping, linear panel and vortex methods; estimation of pressure distributions and resultant airloads on 2-D airfoils, finite wings, slender bodies, and lifting systems; compressibility effects; boundary layer analysis and prediction of drag, separation, and displacement effects. Application to airfoil and wing design. Prerequisite: undergraduate aeronautics course. Recommended: 210A.

3 units, Win (MacCormack)

200B. Applied Aerodynamics II—Analytical and numerical techniques for the aerodynamic analysis of aircraft, focusing on finite wing theory, far-field and Trefftz-plane analysis, two-dimensional laminar and turbulent boundary layers in airfoil analysis, similarity rules, aerodynamic stability derivatives. Bi-weekly assignments require MATLAB or a suitable programming language. Prerequisite: 200A or equivalent. Recommended: 210A.

3 units, Spr (Alonso)

201A. Fundamentals of Acoustics—Acoustic equations for a stationary homogeneous fluid; wave equation; plane, spherical, and cylindrical waves; harmonic (monochromatic) waves; simple sound radiators; reflection and transmission of sound at interfaces between different media; multipole analysis of sound radiation; Kirchhoff integral representation; scattering and diffraction of sound; propagation through ducts (dispersion, attenuation, group velocity); sound in enclosed regions (reverberation, absorption, and dispersion); radiation from moving sources; propagation in the atmosphere and underwater. Prerequisite: first-year graduate standing in engineering, mathematics, sciences, or consent of instructor.

3 units, Spr (Lele) alternate years, not given 2001-02

201B. Topics in Aeroacoustics—Acoustic equations for moving medium, simple sources, Kirchhoff formula, and multipole representation; radiation from moving sources; acoustic analogy approach to sound generation in compact flows; theories of Lighthill, Powell, and Mohring; acoustic radiation from moving surfaces; theories of Curi, FowcsWilliams, and Hawking; application of acoustic theories to the noise from propulsive jets, airframe noise and rotor noise; computational methods for acoustics. Prerequisite: 201A or consent of instructor.

3 units (Lele) not given 2000-01

3 units (Kroo) not given 2001-02

210A. Fundamentals of Compressible Flow—Introduction to compressible flow. Topics: development of the three-dimensional, nonsteady, field equations for describing the motion of a viscous, compressible fluid; differential and integral forms of the equations; constitutive equations for a compressible fluid; the entropy equation; compressible boundary layers; area-averaged equations for one-dimensional steady flow; shock waves; channel flow with heat addition and friction; flow in nozzles and inlets; oblique shock waves; Prandtl-Meyer expansion; unsteady one-dimensional flow; the shock tube; small disturbance theory; acoustics in one-dimension; steady flow in two-dimensions; potential flow; linearized potential flow; lift and drag of thin airfoils. Prerequisites: undergraduate background in fluid mechanics and thermodynamics.

3 units, Aut (Cantwell)

210B. Fundamentals of Compressible Flow—Continuation of 210A with emphasis on more general flow geometry. Use of exact solutions to explore the hypersonic limit. Identification of similarity parameters. Solution methods for the linearized potential equation with applications to wings and bodies in steady flow; their relation to physical acoustics and wave motion in nonsteady flow. Nonlinear solutions for nonsteady constant area flow and introduction to Riemann invariants. Elements of the theory of characteristics; nozzle design; extension to nonisentropic flow. Real gas effects in compressible flow. Flows in various gas dynamic testing facilities. Prerequisite: 210A.

3 units (Alonso) alternate years, given 2001-02

211A. Physical Gas Dynamics—(Enroll in Mechanical Engineering 262A.)

214A. Numerical Methods in Fluid Mechanics—The basic principles underlying the Navier-Stokes equations. Relations between time-accurate and relaxation methods. Implicit and explicit methods combined with flux splitting and space factorization. Considerations of accuracy, stability of numerical methods, and programming complexity. Prerequisites: knowledge of linear algebra and Mechanical Engineering 200A, 200B, or equivalent approved by instructor.

3 units, Aut (Pulliam)

3 units, Win (MacCormack)

3 units, Spr (MacCormack)

215A,B. Advanced Computational Fluid Dynamics—High resolution schemes for capturing shock waves and contact discontinuities; upwinding and artificial diffusion; LED and TVD concepts; alternative flow splittings; numerical shock structure. Discretization of Euler and Navier Stokes equations on unstructured meshes; the relationship between finite volume and finite element methods. Time discretization; explicit and implicit schemes; acceleration of steady state calculations;
residual averaging; math grid preconditioning. Automatic design; inverse problems and aerodynamic shape optimization via adjoint methods. Pre- or corequisite: 214B or equivalent.

3 units each, Win, Spr (Jameson)

217A,B,C. Mathematical and Computational Methods in Engineering—(Enroll in Mechanical Engineering 200A,B,C.)

218. Introduction to Symmetry Analysis—Introduction to the methods of symmetry analysis and their use in the reduction and simplification of physical problems. Topics: dimensional analysis, phase-space analysis of autonomous systems of ordinary differential equations, use of Lie groups to reduce the order of nonlinear ODEs and to generate integrating factors, use of Lie groups to reduce the dimension of partial differential equations and to generate similarity variables, exact solutions of nonlinear PDEs generated from groups. Symmetries and conservation laws, application to Hamiltonian systems, generalized symmetries, recursion operators, Backlund transformations, use of non-local groups to generate soliton solutions of nonlinear wave equations, symmetries derived from a potential equation. Invariant groups of the classical equations of mathematical physics. The two-body problem in classical mechanics, problems in nonlinear heat conduction, nonlinear waves, compressible flow, boundary layers, viscous jets and vortex rings, similarity rules for turbulent shear flows. Mathematica-based software developed by the instructor for finding invariant groups of ODEs and PDEs. Prerequisite: Mechanical Engineering 200A or equivalent.

3 units, Spr (Cantwell)

220. Parallel Methods in Numerical Analysis—(Enroll in Computer Science 238.)

225. Stochastic Processes in Aeronautics—Applications of probability theory to problems in aeronautics, emphasizing random behavior in fluid, thermodynamic, chemical, structural, and control systems of aerospace interest. The random-walk model introduces basic concepts and connects the topics. Time evolution of probability distributions, linking problems in chemical kinetics, rarefied gas flows, thermodynamic nonequilibrium, and finite difference methods in fluid mechanics. Statistical variables: power spectra, correlation functions, transform techniques, the response of a linear system to a random forcing function, and the statistical theory of turbulence. Stochastic models on microcomputers.

3 units (Staff) not given 2000-01

230. Rotorcraft Aerodynamics—The fundamental aerodynamics of rotocraft, including general momentum theory, blade-element theory, and physical concepts of blade motions in hover and forward flight. Topics: dynamics stall, blade-vortex interactions, and active blade controls. Prerequisite: undergraduate aerodynamics.

3 units (Yu) alternate years, given 2001-02

235A,B. Space Systems Engineering—(Enroll in Engineering 235A,B.)

236A. Spacecraft Design—The design of unmanned spacecraft and spacecraft subsystems concentrating on identification of design drivers and current design methods. Topics: spacecraft configuration design, mechanical design, structure and thermal subsystem design, attitude control, electric power, command and telemetry, and design integration and operations.

3 units, Win (Twiggs)

236B,C,D. Spacecraft Design—Continuation of 236A.

236B. 3 units, Spr (Twiggs)

236C. 3 units, Sum (Twiggs)

236D. 3 units, Aut (Twiggs)

238. Human-Centered Design for Aerospace Engineers—The what, when, who, and how of human-centered design. Is it art? or magic? Is it science? or engineering? How to integrate human-centered processes into engineering design processes. Analysis of several recent human-centered aeronautical and space systems to evaluate their successes and limitations.

3 units, Aut (Null)

240A. Analysis of Structures—Elements of two-dimensional elasticity theory. Boundary value problems; energy methods; analyses of solid and thin walled section beams, trusses, frames, rings, monocoque and semi-monocoque structures. Prerequisite: Engineering 14 or equivalent.

3 units, Aut (F. Chang)

3 units, Win (F. Chang)

241A,B. Introduction to Aircraft Design, Synthesis, and Analysis—The total development of new aircraft systems, emphasizing commercial aircraft: the underlying economic and technological factors that create markets for new aircraft from rational and historical viewpoints; determining market demands and system mission performance requirements; optimizing configurations to comply with requirements, emphasizing the interaction of various disciplines (aerodynamics, structures, propulsion, guidance, payload, and ground support; parametric studies); applied aerodynamic and design concepts for use in configuration analysis (airplane layout, wing design, high lift systems, drag, stability and control requirements, and tail sizing). Application to an individually chosen aeronautical system; applied structural fundamentals emphasizing fatigue and fail-safe considerations; design load determination; weight estimation; propulsion system performance and installation; engine types; environmental problems (noise and smoke); performance estimation (takeoff, climb, cruise, and landing). Direct/indirect operating costs prediction and interpretation. Aircraft functional systems (hydraulic, electrical, environmental control); avionics; importance and achievement of aircraft reliability and maintainability. Prerequisite: 100 or equivalent.

241A. 3 units, Win (Alonso)

241B. 3 units, Spr (Kroo)

242A. Continuum Mechanics: An Introduction—(Enroll in Mechanical Engineering 238A.)

242B. Continuum Mechanics: Applications—(Enroll in Mechanical Engineering 238B.)

243A,B. Dynamics—(Enroll in Mechanical Engineering 231A,B.)

244A. Free and Forced Motion of Structures—Vibrations and forced response of linear systems with a finite number of degrees of freedom. Vibrations and forced response of continuous structures, developed in a framework of analytical dynamics; rods, beams, membranes, and other elastic systems. Approximate methods for analyzing nonuniform and built-up structures. Finite-element methods in a dynamic context. Introduction to random responses and to nonlinear systems, as time permits. Prerequisites: 240A, Engineering 15 or equivalent.

3 units, Win (Ashley)

245. Structural Dynamics and Aeroelasticity—Finite-element methods and vibration of continuous, two-dimensional structures. Introduction to aeroelasticity from a unified viewpoint applicable to flight vehicles, rotating machinery, and other elastic systems. Aeroelastic operators and unsteady aerodynamics in two dimensions. Forced response, static and dynamic eigenvalues of a simplified system. Aeroelastic analysis of representative one- and two-dimensional systems. Com-
putational problems covering aerelastic analysis of simple systems. Prerequisite: familiarity with MATLAB or a programming language.

3 units (Alonso) alternate years, given 2001-02

246A. Theory of Plates—(Enroll in Mechanical Engineering 241A.)

246B. Theory of Shells—(Enroll in Mechanical Engineering 241B.)

246D. Vibration and Stability of Plates and Shells: Biomechanical Applications—(Enroll in Mechanical Engineering 241D.)

3 units, not given 2000-01

252. Techniques of Failure Analysis—Introduction to the field of failure analysis, including fire and explosion analysis, large scale catastrophe projects, traffic accident reconstruction, aircraft accident investigation, human factors, biomechanics and accidents, design defect cases, materials failures and metallurgical procedures, and structural failures. Product liability, failure modes and effects analysis, failure prevention, engineering ethics, and the engineer as expert witness. Prerequisite: Engineering 14 or equivalent.

2 units, Spr (Ross)

3 units, Win (Springer)

3 units, Spr (F. Chang)

261A. Statistical Theory and Modeling for Turbulent Flow—(Enroll in Mechanical Engineering 261A.)

268. Digital Image Processing—(Enroll in Electrical Engineering 368A.)

269. Optical Methods in Engineering Science—(Enroll in Electrical Engineering 347.)

270. Introduction to Modern Optics—(Enroll in Electrical Engineering 268.)

271A. Dynamics and Control of Aircraft and Spacecraft—The dynamic behavior of aircraft and spacecraft, and the design of automatic control systems for them. For aircraft: non-linear and linearized longitudinal and lateral dynamics; linearized aerodynamics; natural modes of motion; autopilot design to enhance stability, control the flight path, and perform automatic landings. GPS based navigation and attitude determination. For spacecraft in orbit: natural longitudinal and lateral dynamic behavior and the design of attitude control systems. Prerequisites: 200A or 208; Engineering 15 or equivalent, Engineering 105, and experience with Matlab.

3 units, Spr (Staff)

272C. Global Positioning System—The principles of satellite navigation using GPS. Positioning techniques using code tracking, single and dual frequency, carrier aiding, and use of differential GPS for improved accuracy and integrity. Use of differential carrier techniques for attitude determination and precision position determination. Prerequisite: familiarity with matrix algebra.

3 units, Win (Eng)
SCHOOL OF ENGINEERING

GRADUATE PROGRAMS

UNDERGRADUATE PROGRAM

BACHELOR OF SCIENCE

The Chemical Engineering depth sequence required for the B.S. degree (see the “School of Engineering” section of this bulletin) provides training in applied chemical kinetics, biochemical engineering, electronic materials, engineering thermodynamics, plant design, polymers, process analysis and control, separation processes, and transport phenomena. The B.S. program in Chemical Engineering additionally requires basic courses in biology, chemistry, engineering, mathematics, and physics.

There is no set B.S. program for Chemical Engineering students to follow. A sample program is available from the department’s advisers, the Dean’s Office in the School of Engineering, and at the Handbook for Undergraduate Engineering Programs, http://ughb.stanford.edu/index.js.html. It is recommended that the student discuss the prospective program with his or her adviser, especially if transferring from biology, chemistry, physics, or another field in engineering. With some advanced planning, the student can usually arrange to attend one of the overseas campuses.

For information about a Chemical Engineering minor, see the “School of Engineering” section of this bulletin.

GRADUATE PROGRAMS

The University’s requirements for the M.S., Engineer, and Ph.D. degrees are outlined in the “Graduate Degrees” section of this bulletin.

MASTER OF SCIENCE

An M.S. program comprising an academic year of appropriate course work is available to accommodate students wishing to pursue a professional chemical engineering career after receiving the B.S. degree. The M.S. degree is awarded, without requiring a formal thesis, after a minimum of three quarters of broad study, subject to the specifications stated below.

Unit and Course Requirements—For students terminating their graduate work with the M.S. degree in Chemical Engineering, a program consisting of 42 units of academic work is required, including at least four lecture courses selected from the Chemical Engineering 200 to 400 lecture series. The remaining courses comprise all science or engineering graduate courses, and by petition to the Chair of the Department of Chemical Engineering, upper-division undergraduate courses in science and engineering. Credit toward the M.S. degree is not given for Chemical Engineering Special Topics courses numbered 500 to 512, or for the colloquium, 699. However, students must register for 699 and attend the colloquia.

Students wishing to obtain research experience should choose a research adviser and enroll in Chemical Engineering 600; up to 6 units may count toward the 42-unit requirement. Chemical Engineering 600, however, may not be substituted for any of the required four lecture courses in the Chemical Engineering 200 to 400 lecture series. A written report describing the results of this research must be submitted to and approved by the research adviser.

To ensure that an appropriately balanced program is taken by all M.S. candidates, the student’s program must be approved by the graduate adviser, and a program proposal for the M.S. degree should be developed by the student and adviser at their first meeting of the academic year.

Residency Requirement—See General Requirements in the “Graduate Degrees” section of this bulletin.

Minimum Grade Requirement—All courses intended to satisfy the 42-unit M.S. degree requirement must be taken for letter grades, if offered, and an overall grade point average (GPA) of 3.0 must be maintained.
ENGINEER

The degree of Engineer is awarded after completion of six quarters of study beyond the B.S. degree, plus the requirements listed below. This degree is not required to enter the Ph.D. program.

Unit and Course Requirements—A minimum of 72 total units (including research) and 42 units of course work is required for the Engineer degree, including the following Chemical Engineering courses: 300, 310A, 310B, 340, 345, 350, 355, and one quarter of 370. The remaining courses, to total 42 units, may be chosen from the basic sciences and engineering according to the guidelines given in the Master of Science section above and with the consent of the graduate adviser. Students seeking the Engineer degree may apply for the M.S. degree once the requirements for that degree have been fulfilled (see above Master of Science section).

Residency Requirement—See General Requirements in the "Graduate Degrees" section of this bulletin.

Minimum Grade Requirement—All courses intended to satisfy the degree requirements must be taken for letter grades, if offered, and an overall grade point average (GPA) of 3.0 must be maintained.

Thesis Requirement—The thesis must represent a substantial piece of research equivalent to nine months of full-time effort and must be approved by a reading committee consisting of two members of the Chemical Engineering faculty.

Qualification for the Ph.D. Program by Students Receiving the Degree of Engineer—After completing all the requirements for the Engineer degree, a student may request to be examined on the Engineer research work for the purpose of qualifying for the Ph.D. If the request is granted, the student’s thesis must be available in its final form for inspection by the faculty and must have been approved by the reading committee at least two weeks prior to the scheduled date of the examination.

DOCTOR OF PHILOSOPHY

The Ph.D. degree is awarded after completion of a minimum of nine quarters of study plus the requirements listed below.

Unit and Course Requirements—A minimum of 72 total units (including research) and 42 units of course work is required for the Ph.D. degree, including the following Chemical Engineering courses: 300, 310A, 310B, 340, 345, 350, 355, and one quarter of 370. In addition, two courses must be taken from one of the areas of concentration in the 440, 450, or 460 series. The remaining courses, to total 42 units, may be chosen from the basic sciences and engineering according to the guidelines given in the above Master of Science section and consent of the graduate adviser. Students seeking the Ph.D. degree may apply for the M.S. degree once the requirements for that degree have been fulfilled (see above Master of Science section).

Residency Requirement—See General Requirements in the Graduate Degrees section of this bulletin.

Minimum Grade Requirement—All courses intended to satisfy the degree requirements must be taken for letter grades, if offered, and an overall grade point average (GPA) of 3.0 must be maintained.

Teaching Requirement—All Ph.D. candidates, regardless of the source of their financial support, are required to gain teaching experience as an integral part of graduate training in the Department of Chemical Engineering.

Qualifying Examination—To be advanced to candidacy for the Ph.D. degree, the student must pass a preliminary qualifying examination. First-year students are asked to present orally and defend a critical review of a published paper before the faculty at the beginning of their first Spring Quarter. This examination is used to decide whether or not these students will be allowed to choose research advisers and begin thesis research in the Spring Quarter of their first year. Failing this examination leads to termination of the student’s study towards the Ph.D. degree. It also precludes financial aid beyond that already promised. Under these circumstances, the student may apply for the M.S. degree once the requirements for that degree have been fulfilled (see above Master of Science section). Students passing this preliminary examination take a qualifying examination consisting of an oral defense of their research work before the faculty early in the Autumn Quarter of their second year.

Dissertation Requirement—A dissertation based on a successful investigation of a fundamental problem in chemical engineering is required; the student enrolls in Chemical Engineering 600 during the course of this research. In four to five calendar years after enrolling in the department, the student is expected to have fulfilled all the requirements for the Ph.D., including submission of a completed dissertation that has already been approved by his or her research adviser to the reading committee. No sooner than four weeks after this date, the student’s University oral examination is scheduled. This exam, based on the candidate’s dissertation research, is in the form of a public seminar followed by private questioning by an examining faculty committee. After satisfactory performance in the examination and submission of the dissertation to the Degree Progress, Office of the Registrar, the Ph.D. degree is awarded.

RESEARCH ACTIVITIES

Research investigations are currently being carried out in the following fields: applied statistical mechanics, bio catalysis, bioengineering, colloid science, computational materials science, electronic materials, hydrodynamic stability, kinetics and catalysis, Newtonian and non-Newtonian fluid mechanics, polymer science, rheo-optics of polymeric systems, and surface and interface science. Additional information may be found at the Department of Chemical Engineering website http://chemeng.stanford.edu.

FELLOWSHIPS AND ASSISTANTSHIPS

A number of fellowships and assistantships are awarded each year to incoming students. Application forms may be obtained from the department. The completed application must be received no later than January 15 preceding the start of the academic year for which the award is to be made.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

(AU) indicates that the course is subject to the University Activity Unit limitations (8 units maximum).

PRIMARILY FOR UNDERGRADUATES

20. Introduction to Chemical Engineering—(Enroll in Engineering 20.)
3 units, Aut (Robertson)

50Q. Stanford Introductory Seminar: Drug Delivery in the 21st Century—In the near future, medication will be delivered with highly engineered, controlled delivery systems. Such systems, currently available for motion sickness, heart pain, and high blood pressure, are developed by joining chemistry, biology, medicine, materials science, and engineering to design novel drug delivery devices. Students visit local companies where such devices are made. Guest scientists and engineers describe products on the market and in the pipeline. One sophisticated drug delivery system, the cigarette, is studied, learning about a technology that has created more harm than good; however, what we learn from it someday might form the basis for a therapeutic delivery system. Recommended: prior exposure to chemistry, physics, biology, mathematics, physiology.
3 units, Aut (Robertson, Rosen)

25. Biotechnology—(Enroll in Engineering 25.)
3 units, Aut (Robertson)

100. Chemical Process Modeling, Dynamics, and Control—Mathematical methods are applied to engineering problems, using chemical engineering examples. The development of mathematical models to describe chemical process dynamic behavior. Analytical and computer simulation techniques for the solution of ordinary differential equations. Dynamic behavior of linear first- and second-order systems. Introduc-
tion to process control. Dynamics and stability of controlled systems. Prerequisites: Mathematics 53 or 130, or Engineering 155A, or equivalent; Engineering 20.
3 units, Aut (Staff)

110. Equilibrium Thermodynamics—Thermodynamic properties, equations of state, properties of non-ideal systems including mixtures, and phase and chemical equilibria. Prerequisite: Chemistry 171.
3 units, Win (Madix)

120A. Fluid Mechanics—The flow of isothermal fluids from a momentum transport viewpoint. Continuum hypothesis, scalar fields, fluid statics, deformation of continuous media, non-Newtonian fluids, the equations of motion, creeping and potential flow, boundary layer theory, turbulence, free-surface phenomena, theory of stability. Prerequisites: junior standing in chemical engineering or consent of instructor; 100, and Mathematics 53 or Mathematics 130 or Engineering 155A, or equivalent.
4 units, Win (Shaqfeh)

120B. Energy and Mass Transport—The transport of energy and mass in solid and fluid continua. Fourier's law, heat transfer in solids, laminar flow, forced and free convection, boundary-layer heat transfer, natural convection with application to geophysical flows, energy transport by radiation, Fick's law, mass transfer with chemical reaction, transport in turbulent flows, heat and mass transfer analogies. Prerequisite: 120A or equivalent.
4 units, Spr (Fuller)

130. Separation Processes—Analysis and design of equilibrium and non-equilibrium separation processes. Possible examples: distillation, liquid-liquid extraction, electrophoresis, centrifugation, chromatography, and reaction-assisted separation processes.
3 units, Spr (Musgrave)

140. Microelectronics Processing Technology—The chemistry and transport of microelectronics device fabrication. Introduction to solid state materials and electronic devices. Chemical processes including crystal growth, chemical vapor deposition, etching, oxidation, doping, diffusion, metallization, and plasma processing with emphasis on chemical, kinetic and transport considerations.
3 units, Spr (Bent)

150. Biochemical Engineering—The general principles used in the biological production of fine biochemicals, with an emphasis on biopharmaceuticals. Basic and applied principles in: enzyme kinetics, microbial physiology, recombinant DNA technology, metabolic engineering, fermentation media design, fermentor design, aseptic processing, fermentation process control and scale-up, product isolation, protein purification, protein folding, regulatory issues, and biochemical process cost modeling.
3 units, Aut (Swartz)

160. Polymer Science and Engineering—Introduction to polymer science, including free-radical and condensation polymerization, morphology of amorphous and semicrystalline polymers, linear viscoelasticity and rheology. Selected applications of polymers in information technology.
3 units, Win (Frank)

3 units, Aut (Gast)

180. Chemical Engineering Plant Design—Open to seniors in chemical engineering or by consent of instructor. Application of chemical engineering principles to the design of practical plants for the manufacture of chemicals and related materials. Topics: flow-sheet development from a design concept, equipment design for distillation, chemical reactors, heat transfer, pumping, and compression; estimation of capital expenditures and production costs; plant construction.
3 units, Spr (Pavone)

185A.B. Chemical Engineering Laboratory—Investigation of the experimental aspects of chemical engineering science, emphasizing development of communications skills. Experiments illustrating lecture subjects are conducted by groups of students. Lab. (WIM)
185A. 3 units, Aut (Frank)
185B. 3 units, Win (Klug)

190. Undergraduate Research in Chemical Engineering—Lab or theoretical work for undergraduate students under the direct supervision of a faculty member. Research in one of the graduate research groups or other special projects in the undergraduate chemical engineering lab. Students should consult advisers for information on available projects.
(Staff)

PRIMARILY FOR GRADUATE STUDENTS

240. Microelectronic Processing Technology—See 140.
3 units, Spr (Bent)

250. Biochemical Engineering—See 150.
3 units, Aut (Swartz)

3 units, Win (Frank)

300. Applied Mathematics in Chemical Engineering—Mathematical problems in transport phenomena, fluid mechanics, reactor design, quantum chemistry, and polymer science. Applications of tensor calculus, ordinary differential equations, linear eigenvalue problems, perturbation theory (regular and singular), topics in partial differential equations, Fourier transforms. Prerequisites: Mathematics 53, 113, 130; or Engineering 155A, Mathematics 131 or Engineering 155B, or equivalent.
3 units, Aut (Klug)

310A. Microscale Transport—Introduction to transport on small scales where macroscopic or bulk convective processes are unimportant. The basic equations of mass, momentum, and energy are derived for incompressible fluids. Local analysis based on the flow kinematics. Simplifications of these equations in the Stokes or creeping flow regime; solution techniques for these reduced sets of equations. Topics: Green's function or boundary integral solution methods, point particle solutions, rigid or semi-rigid particulate motion in suspension, drop and bubble flows including thermocapillary motion, lubrication theory and the effective properties of composite media and suspensions; and time permitting, slender body theory and Brownian motion. Prerequisites: 120A, 120B, 300, or equivalents.
3 units, Win (Fuller)

310B. Connective Transport and Reaction Engineering—Continuation of 310A. Macroscale or convective transport of mass, momentum, and energy including chemical reaction from a fundamental perspective. Topics: inviscid flow theory and its coupling to mass, momentum, and energy boundary layers including free jets and wakes; boundary layers adjoining regions of constant circulation (e.g., drop flows) including Prandtl-Batchelor layers; convective mass transport with and without reaction, including Taylor-dispersion and generalized Graftel problems; the fundamentals for mass, momentum, and energy transport correlations. The concepts are applied to basic reaction engineering. Prerequisite: 310A or consent of the instructor.
3 units, Spr (Homsey)

3 units (Staff)

345. Spectroscopy and Applications of Quantum Mechanics—Development of theoretical approaches to spectroscopy, including spectroscopic transitions, transition probabilities, and selection rules. Photon and electron spectroscopies of the gas and solid phase. Topics: infrared, electron energy loss and Raman vibrational spectroscopies; Auger, x-ray and ultraviolet photoelectron spectroscopies; synchrotron-based spectroscopies including near edge x-ray absorption fine structure; basic nuclear magnetic resonance. Possible topics: solid state and computational methods. Prerequisite: Chemistry 271 or quantum mechanics.

3 units, Win (Bent)

350. Principles of Cellular Systems—Introduction to biological systems for engineering students. Emphasis is on viewing the cell as an integrated network of processes. Topics: what is the genome and how is it interpreted, how are cells organized spatially and energetically, protein catalysis, regulation of protein expression and other cellular processes, and new techniques in functional genomics. Biological Sciences 52 may be substituted.

3 units, Aut (Kao)

355. Advanced Biochemical Engineering—The technological tools for exploiting the power offered by modern biology. How a cell interacts with and influences its environment, how a production organism is optimized, what technology is used for large scale production, how products are isolated and purified, how proteins can be made without living cells, how a biopharmaceutical is formulated and delivered, and what the regulatory requirements are for drug approval and sale. Prerequisite: 350 or Biological Sciences 52, or equivalent.

3 units, Win (Swartz)

370A,B,C,D. Introduction to Chemical Engineering Research—One-quarter research projects (laboratory, library, or theoretical research) under the guidance of a faculty member. Findings are reported in a poster session for the entire department at the end of the quarter, with a written report to adviser.

3 units, Aut, Win, Spr, Sum (Staff)

3 units, Spr (Gast)

422. Structure and Reactivity of Solid Surfaces—The structure of solid surfaces, including a description of experimental methods for determining the structures of single crystal surfaces. The adsorption of molecules on these surfaces, e.g., the thermodynamics of adsorption processes, surface diffusion, and the molecular structure of the adsorbates. Surface mediated reactions, i.e., heterogeneous catalysis, including descriptions of catalytic mechanisms and surface kinetics.

3 units, Win (Madix)

444A. Quantum Simulations of Molecules and Materials—Molecules and surfaces: quantum atomistic simulations of molecules and surfaces to predict atomic structure, properties, reaction mechanisms, and kinetics. Review of quantum mechanics. Electronic structure calculations: Hartree Fock, configuration interaction, many body perturbation theory, and density functional theory. Property calculations: energy, forces, structure, and electronic and vibrational spectra. Applications to semiconductor processing, surface science, biochemistry, catalysis, polymers, environmental chemistry, and combustion. Prerequisite: undergraduate level quantum mechanics.

3 units, Win (Musgrave)

450. Introduction to Biotechnology—(Same as Biochemistry 237, Civil and Environmental Engineering 237, Developmental Biology 237, Structural Biology 450.) Faculty from the departments of Biochemistry, Biological Sciences, Chemical Engineering, Civil and Environmental Engineering, Developmental Biology, Structural Biology, and invited industrial speakers review the interrelated elements of modern biotechnology. Topics: protein structure and dynamics, protein engineering, biocatalysis, gene expression, cellular metabolism and metabolic engineering, fermentation technology, and purification of biomolecules. Prerequisite: graduate student or upper-division undergraduate in the sciences or engineering.

3 units, Spr (Robertson, Swartz)

452. Protein Science and Engineering—(Same as Chemistry 232.) The physio-chemical interactions that govern the structure and function of proteins. Topics: protein function and structure, techniques for probing protein structure and function, mechanisms of protein function, design of proteins with novel properties. Examples from the literature on enzymes. Recommended: background in physical and organic chemistry.

3 units, Win (Khosla)

454. Metabolic Engineering Methods and Applications—The optimization of industrial organisms for maximal benefit. In the context of actual applications, metabolic pathways and how they are regulated, metabolic flux analysis, and traditional and rDNA methods for genetic engineering. Examples in the areas of: metabolite production, DNA protein production by bacteria and mammalian cells, petroleum desulfurization, bioremediation, and cell-free protein synthesis. Prerequisites: 250, 355 or equivalent.

3 units, Spr (Swartz) alternate years, not given 2001-02

459. Frontiers in Interdisciplinary Biosciences—(Cross-listed in multiple departments in the schools of Humanities and Sciences, Engineering, and Medicine; students should enroll directly through their affiliated department, if at all possible.) Introduction to cutting-edge research involving interdisciplinary approaches to bioscience and biotechnology; for specialists and non-specialists. Associated with Stanford’s Clark Center for Interdisciplinary Bioscience, and held in conjunction with a seminar series meeting twice monthly during 2000-01. Leading investigators from Stanford and throughout the world speak on their research; students also meet separately to present and discuss the ever-changing subject matter, related literature, and future directions. Prerequisite: keen interest in all of science, with particular interest in life itself. Recommended: basic knowledge of biology, chemistry, and physics.

2 units, Aut, Win, Spr (S. Block)

460. Polymer Physics—The application of statistical thermodynamics to elucidate structural properties of high molecular weight polymers. The conformation of single polymer chains in solution and the bulk with the analysis based on rotational isomeric state theory and the experimental verification coming from scattering measurements. Statistical thermodynamic analyses for the study of phase behavior in polymer solutions, blends blocks copolymers, and liquid crystals. Non-equilibrium features of glassy polymers, including theories of the glass transition and physical aging. The theories used to treat the kinetics of polymer crystallization, including the Avrami and Lauritzen-Hoffman approaches.

3 units, Spr (Frank) alternate years, not given 2001-02

462. Dynamics of Complex Liquids—Flow and orientation phenomena of polymeric and colloidal liquids; fundamental concepts of rheology; diffusion processes in complex liquids; molecular models of dilute and concentrated polymer solutions and melts (flexible and rigid systems);
reptation and scaling theories of polymer liquids; introduction to liquid crystals, surfactant liquids, and suspensions. Prerequisites: 300, 310A. 3 units, Spr (Shaqfeh)

500-512. Special Topics in Chemical Engineering—Discussion of recent developments and current research in specialized fields. Units by arrangement. Prerequisite: consent of instructor. 
Aut, Win, Spr

500A,B,C. Protein Biotechnology
(Swartz)

501A,B,C. Semiconductor Processing
(Benti)

502A,B,C. Computational Materials Science
(Musgrave)

503A,B,C. Biocatalysis
(Khosla)

504A,B,C. Bioengineering
(Robertson)

505A,B,C. Microrheology
(Fuller)

506A,B,C. Surface and Interface Science
(Madix)

507A,B,C. Polymer Physics and Molecular Assemblies
(Frank)

508A,B,C. Stability of Fluid Motions
(Homsy)

509A,B,C. Statistical Mechanics of Dispersed Systems
(Gast)

510A,B,C. Transport Mechanics
(Shaqfeh)

511A,B,C. NMR of Solids
(Klug)

512A,B,C. Functional Genomics
(Kao)

600. Graduate Research in Chemical Engineering—Lab and theoretical work for graduate students on chemical engineering problems leading to partial fulfillment of requirements for an advanced degree. Credit is given after the student has satisfied the specific report or dissertation requirement. 
(Staff)

699. Colloquium—Students attend the colloquia of the Department of Chemical Engineering. Must be taken every quarter by candidates for advanced degrees in Chemical Engineering. (AU) I unit, Aut, Win, Spr (Staff)

CIVIL AND ENVIRONMENTAL ENGINEERING

Chair: Clyde B. Tatum
Associate Chair: Lynn M. Hildemann

Associate Professors: Ronald L. Borja, Craig S. Criddle, Gregory G. Deierlein, Martin Fischer, David L. Freyberg, Lynn M. Hildemann

Assistant Professors: Mark Z. Jacobson, Laura N. Lowes, Charles A. Menun, Eduardo Miranda, Alfred M. Spormann

Professors (Research): Hans C. Bjornsson, C. Allin Cornell, Martin Reinhard

Professor (Teaching): Gilbert M. Masters

Courtey Professors: Joel H. Fenziger, Thomas J. Hughes, Robert McGinn, Peter M. Pinsky, David Pollard, George S. Springer

Consulting Associate Professors: Steve Armfield, Mark N. Goltz, Michael E. London, Melody Spradling, Jane Woodward, Yan Zang

Consulting Assistant Professors: Ronald J. Calhoun, Olaf Cirpka, George Redden

Lecturers: Derek Fong, Renate Fruchter, Mark Kroll

Visiting Professor: Katsuhiro Ishida

Visiting Associate Professors: Amatzia Genin, Jerome F. Hajjar

The undergraduate Civil Engineering major provides a pre-professional program balancing the fundamentals common to many special fields of civil engineering with specialization in Environmental and Water Studies or Structures and Construction. The undergraduate Environmental Engineering major offers a more focused program in Environmental Engineering Science. Laboratory facilities are available to students in building energy, construction, environmental engineering science, experimental stress analysis, fluid mechanics, and structural and earthquake engineering.

At least one year of graduate study is strongly recommended for professional practice. Students who contemplate advanced study at Stanford should discuss their plans with their advisers in the junior year. The co-terminal B.S.-M.S. program should be considered by students who want an integrated five-year program. Potential coterminal students in Environmental Engineering Science should be aware that applications are considered once a year, near the beginning of Winter Quarter.

The Department of Civil and Environmental Engineering (CEE), in collaboration with other departments of the University, offers graduate degree programs in:

Construction Engineering and Management

Environmental and Water Studies

Environmental Engineering and Science

Environmental Fluid Mechanics and Hydrology

Structural Engineering and Geomechanics

Geomechanics

Structural Engineering

Research work and instruction under these programs are carried out in the following facilities: Building Energy Laboratory, Environmental Fluid Mechanics Laboratory (EFML), Geotechnical Engineering Laboratory, Structural Engineering Laboratory, and water quality control research and teaching laboratories. Research in earthquake engineering is conducted in the John A. Blume Earthquake Engineering Center. Research on control of hazardous substances is coordinated within the Western Region Hazardous Substance Research Center.

In collaboration with the Department of Computer Science, the Center for Integrated Facility Engineering (CIFE) employs advanced CAD, artificial intelligence, communications concepts, and information management to integrate the presently fragmented participants in the facility development process and to support design and construction automation. CIFE is stimulating significant new research and educational activities in the two departments.

PROGRAMS OF STUDY

The Construction Engineering and Management program prepares technically qualified students for responsible management roles in all
phases of the development of major constructed facilities. It emphasizes management techniques useful in planning, coordinating, and controlling the activities of diverse specialists (designers, contractors, subcontractors, and client representatives) within the unique project environment of the construction industry. In addition, the program offers subjects that focus on the engineering aspects of heavy, industrial, residential, and building construction. By appropriate choice of elective subjects, students wishing to work for a contractor, construction management consultant, design firm, or the facilities department of an owner’s organization can design a program for their needs.

The construction curriculum includes core courses, construction engineering electives, and construction management electives. Subjects offered include building systems, construction administration, construction finance and accounting, design and construction of housing, real estate development, equipment and methods, estimating, international construction, labor relations, managing human resources, planning and control techniques, productivity improvement, and project and company organizations. Additional related course work is available from other programs within the department, from other engineering departments, and from other schools in the University such as Earth Sciences and the Graduate School of Business.

The program leads to the degrees of Master of Science (M.S.), Engineer, and Ph.D. Students with undergraduate degrees in chemical, electrical, mechanical, mining, and petroleum engineering, or in architecture who do not wish to satisfy the undergraduate prerequisite courses for the M.S. in Civil and Environmental Engineering—Construction Engineering and Management have the option of meeting the same graduate course requirements as the above and obtaining the M.S. in Engineering—Construction Engineering and Management. A limited number of M.S.-level graduate students and most Ph.D. candidates are supported each year through the sponsored research and teaching activities and through industry-sponsored fellowships.

The Construction Program faculty and students are active participants in the Center for Integrated Facility Engineering (CIFE). CIFE conducts research on the automation, integration, and management of technology.

The program maintains close ties with the construction industry through the Stanford Construction Institute. Students participate in weekly discussions with visiting lecturers from all sectors of the U.S. construction industry.

DESIGN/CONSTRUCTION INTEGRATION

To better prepare graduates for successful careers as design and construction professionals making major contributions to integrated projects, the Department of Civil and Environmental Engineering offers a Master of Science degree field in Design/Construction Integration.

The purpose of the new degree field is to educate professionals who have a strong design or construction background, understand the goals and concerns of the many other project stakeholders, and are prepared for multidisciplinary collaborative teamwork in an integrated design and construction process.

The field of Design/Construction Integration is open to applicants with backgrounds in engineering and science. Applicants should also have a background in the planning, design, or construction of facilities by virtue of previous work experience and/or their undergraduate education. Knowledge in basic subjects from the traditional areas of civil engineering is necessary for students to receive the degree and to satisfy prerequisite requirements for some of the required graduate courses.

The field in Design/Construction Integration requires 45 quarter units, which are normally completed in one academic year. This includes core courses in design/construction integration, structural and geotechnical engineering, and construction engineering and management, along with approved electives.

The department offers three programs related to the design and construction of facilities: Structural Engineering and Geomechanics (S/G), Construction Engineering and Management (CEM), and Design/Construction Integration (DCI).

The S/G program prepares students to launch careers as designers, engineering analysts, engineering risk managers, specialty consultants, or tool developers. It encompasses structural analysis and design, dynamics, earthquake engineering, risk and reliability analysis, modern computational methods, and geomechanics.

The CEM program prepares technically qualified students for responsible management roles in all phases of the development of major constructed facilities. It emphasizes management techniques useful in organizing, planning, and controlling the activities of diverse specialists working within the unique project environment of the construction industry. The program also includes the engineering aspects of heavy, industrial, and building construction.

The DCI program prepares students for multidisciplinary collaborative teamwork in an integrated design and construction process. The program extends a student’s design or construction background with core courses in each of these areas and develops the background needed to understand the concerns and expertise of the many project stakeholders. It includes a comprehensive project-based learning experience.

Prospective students should use their intended career path as the primary criterion in selecting between these three programs. S/G best fits students planning to focus on designing facilities; CEM is for students planning to emphasize building facilities or managing teams and operations. Both of these degree options provide background for many different types of careers in design and construction, with some emphasis on preparation for working on projects using the traditional form of contracting and organization that characterizes public works. Students planning careers in design or construction firms that emphasize design-build, EPC, or turnkey projects should consider DCI. All three of these degree options include substantial flexibility for students to tailor their program of study to career interests.

ENVIRONMENTAL AND WATER STUDIES

This program covers a broad spectrum of specialties, including environmental engineering and science, environmental fluid mechanics, environmental planning, and hydrology. Course offerings are scheduled to permit either intensive study in a single area or interrelated study between areas. Seminars provide a broad coverage of environmental problems. The programs are kept flexible to foster interaction among students and to encourage the development of individual programs suitable for a broad range of engineering and science backgrounds and career goals. The Stanford laboratories for water quality control and environmental fluid mechanics are well equipped and instrumented for advanced research and instruction.

Students with backgrounds in all areas of engineering and science who are interested in applying their specialized abilities to solving environmental and water problems are welcome. Comprehensive introductory courses in each major area of study are given to provide common understanding among those with dissimilar backgrounds. Courses from many other programs and departments both complement and supplement these course offerings. Some examples include Computer Science (numerical methods), Geologic and Environmental Sciences (geostatistics, hydrogeology), Mechanical Engineering (applied math, experimental methods, fluid mechanics, heat transfer), Petroleum Engineering (reservoir engineering, well-test analysis), and Statistics (probability and statistics).

The major areas of specialization in the two programs, environmental engineering and science, and environmental fluid mechanics and hydrology, are described below. Admissions to these two programs are handled separately; prospective students should clearly indicate their preference on their application by specifying one or the other area of specialization.

The Environmental Engineering and Science Program emphasizes the chemical and biological processes involved in pollution treatment, remediation, and control issues. Course offerings include the biological, chemical, and engineering aspects of water supply; the movement and fate of pollutants in surface and groundwater, soils, and the atmosphere; hazardous substance control; molecular environmental biotechnology; and water and air pollution. Companion courses in the Environmental Fluid Mechanics and Hydrology Program include environmental planning and impact assessment, as well as environmental fluid mechanics, hydrology, and transport modeling. Research on hazardous substances is coordinated through the Western Region Hazardous Substance Re-
The objective of this center, sponsored by the U.S. Environmental Protection Agency, is to promote through fundamental and applied research the development of alternative and advanced physical, chemical, and biological processes for the treatment of hazardous substances in the environment, with emphasis on groundwater contamination.

The Environmental Fluid Mechanics and Hydrology Program focuses on developing an understanding of the physical processes controlling the movement of mass, energy, and momentum in the water environment and the atmosphere. The program also considers environmental and institutional issues involved in planning water resources development projects. Environmental fluid mechanics courses address experimental methods; fluid transport and mixing processes; the fluid mechanics of stratified flows; natural flows in coastal waters, estuaries, lakes, and open channels; and turbulence and its modeling. Hydrology courses consider flow and transport in porous media, stochastic methods in both surface and subsurface hydrology, and watershed hydrology and modeling. Atmosphere-related courses deal with climate, weather, storms and air pollution and their modeling. Planning courses emphasize environmental policy implementation and sustainable water resources development. The research of this group is focused primarily in the Environmental Fluid Mechanics Laboratory, which includes the P. A. McCuen Environmental Supercomputer Center.

STRUCTURAL ENGINEERING AND GEOMECHANICS

Structural engineering at Stanford encompasses computational mechanics, computer-aided engineering, risk and reliability analysis, structural analysis and design, and teaching and research programs in earthquake engineering and structural dynamics. The programs are designed to provide a broad knowledge in these fields and to prepare students for industrial or academic careers. Academic programs can be designed to meet the needs of students wishing to launch careers as consultants on large and small projects, designers, and engineering analysts. Students have the opportunity to balance strong engineering fundamentals with modern computational methods.

Course work in earthquake engineering and structural dynamics provides an understanding of the earthquake phenomenon, the resulting ground shaking, and in-depth knowledge on the behavior, analysis, and design of various types of structures under seismic or other dynamic forces. Automated structural monitoring devices and control systems, and the utilization of advanced materials for civil infrastructures and seismic retrofits, are part of the ongoing research activities. Advanced analytical and experimental research in earthquake engineering is conducted at the John A. Blume Earthquake Engineering Center, which houses static and dynamic testing equipment including two shaking tables.

Reliability and risk analysis focuses on instruction and research in advanced methods for structural safety evaluation and design, including methods for loss estimation from damage and failures of structures and lifeline systems. Course work combines a strong background in structural analysis and design with probability theory and statistics. Research in this area deals with regional loss and damage evaluation, reliability of marine systems, seismic risk and reliability of large structural systems, and wind hazards.

Courses and research in structural analysis and design focus on the conceptual and detailed design of structural systems and on computational methods for predicting the static and dynamic, linear and non-linear response of structures. Included are courses that emphasize earthquake resistant design and computer-based design concepts. Related course work is available from other departments such as computer science, materials science and engineering, and mechanical engineering. In collaboration with CIFE, issues involving design for constructibility, engineering information management and collaborative engineering are addressed as an integral part of the research.

Computational mechanics emphasizes the application of modern computing methods to structural engineering and geomechanics. It draws on the disciplines of computer science, mathematics, and mechanics, and encompasses numerical structural and geotechnical analysis, including finite element analysis and boundary element methods. There is collaborative research in high performance computing with the Scientific Computing and Computational Mathematics Program.

Students with primary interests in the application of the principles of applied mechanics to problems involving geologic materials have the option of enrolling in a degree program in geomechanics. This program focuses on instruction and research in theoretical soil and rock mechanics, computational methods, and analysis and design of foundations and earth structures. In addition to the program's offerings, related courses are available in construction engineering, earth sciences, structural engineering, and the water resources program.

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

Students who major in civil engineering or in environmental engineering must complete the appropriate requirements for the B.S. degree listed under Undergraduate Programs in the "School of Engineering" section of this bulletin. Elective units may be used in any way the student desires, including additional studies in civil and environmental engineering. Because the undergraduate engineering curriculum is designed to ensure breadth of study, students who intend to enter professional practice in civil or environmental engineering should plan to obtain their professional education at the graduate level.

A number of undergraduate programs at Stanford may be of interest to students seeking to specialize in environmental studies. In addition to the two majors offered within our own department, interested students should examine related programs such as Earth Systems, Geophysical and Environmental Sciences, Urban Studies, and Human Biology.

For information about a Civil Engineering minor, see the "School of Engineering" section of this bulletin.

HONORS PROGRAM

This program leads to a B.S. with Honors in Civil Engineering or in Environmental Engineering. It is designed to encourage highly qualified students to undertake a more intensive study of civil and environmental engineering than is required for the normal major via a substantial, independent research project.

The program involves an in-depth research study in an area proposed to and agreed to by a Department of Civil and Environmental Engineering (CEE) faculty adviser and completion of a thesis of high quality. A written proposal for the research to be undertaken must be submitted and approved in the fourth quarter prior to graduation. The thesis is supervised by a CEE faculty adviser and must involve input from the School of Engineering Writing Program by means of Engineering 102S or its equivalent. Students are encouraged to present their results in a seminar for faculty and other students. Up to 10 units of CEE 199, Undergraduate Research in Civil and Environmental Engineering, may be taken to support the research and writing (not to duplicate Engineering 102S). These units are beyond the normal Civil Engineering or Environmental Engineering program requirements.

GRADUATE PROGRAMS

The University requirements governing the M.S., Engineer, and Ph.D. are described in the "Graduate Degrees" section of this bulletin.

Admission—Applications require submission of the application form, statement of purpose, three letters of recommendation, results of the General Section of the Graduate Record Examination, and transcripts of courses taken at colleges and universities. Policies for each of the department's programs are available from the Department of Civil and Environmental Engineering. Successful applicants are advised as to the degree and program for which they are admitted. If students wish to shift from one program to another after being accepted, an application for transfer must be filed with the department, and they are advised if the transfer is possible. If, after enrollment at Stanford, students wish to continue toward a degree beyond the one for which they were originally admit-
Financial Assistance—The department maintains a large and continuing program of financial aid for graduate students. Applications for financial aid and assistantships should be filed by January 1; it is important that Graduate Record Examination scores be available at that time.

Teaching assistantships carry stipends for as much as one-half time work to assist with course offerings during the academic year. Research assistantships also are available. Engineer and Ph.D. candidates may be able to use research results as a basis for the thesis or dissertation. Assistantships and other basic support may be supplemented by fellowship and scholarship awards or loans. Continued support is generally provided for further study toward the Engineer or Ph.D. degree based on the student’s performance, the availability of research funds, and requisite staffing of current projects.

MAJOR OF SCIENCE

Programs are available leading to the M.S. degree in Civil and Environmental Engineering with the following special field designations on the diploma: Construction Engineering and Management, Design/Construction Integration, Environmental Engineering and Science, Environmental Fluid Mechanics and Hydrology, Geomechanics, and Structural Engineering. Detailed statements of the requirements for all master’s degrees and the specific designation may be secured from the Department of Civil and Environmental Engineering.

Students admitted to graduate study with a B.S. in Civil Engineering (or its equivalent) from an accredited curriculum can satisfy the requirements for the M.S. degree in Civil and Environmental Engineering by completing a minimum of three quarters of full tuition registration and a minimum of 45 units of study beyond the B.S. At least 36 of the units must be taken at Stanford. A minimum 2.75 grade point average (GPA) is required for candidates to be recommended for the M.S. degree. No thesis normally should be started in the first quarter of graduate study after completing, in residence, 45 or more units of work (three quarters minimum) including an acceptable thesis (12 to 15 units) and maintaining a ‘B’ GPA average (3.0) or higher. The program of study must be approved by a faculty member in the department.

The program of study must be approved by the faculty of the department and should include at least 45 units of courses in engineering, mathematics, science, and related fields unless it can be shown that other work is pertinent to the student’s objectives.

Candidates for the M.S. in Civil and Environmental Engineering who do not have a B.S. in Civil Engineering may, in addition to the above, be required to complete those undergraduate courses deemed important to their graduate programs. In such cases, more than three quarters of residence is often required to obtain the degree.

ENGINEER

A student with an M.S. in Civil Engineering may satisfy the requirements of the degree of Engineer in Civil and Environmental Engineering by completing, in residence, 45 or more units of work (three quarters minimum) including an acceptable thesis (12 to 15 units) and maintaining a ‘B’ GPA average (3.0) or higher. The program of study must be approved by a faculty member in the department.

This degree is recommended for those desiring additional graduate education, especially those planning a career in professional practice. The thesis normally should be started in the first quarter of graduate study after the M.S. degree. Programs are offered in the fields of specialization mentioned for the M.S. degree.

DOCTOR OF PHILOSOPHY

The Ph.D. is offered under the general regulations of the University as set forth in the “Graduate Degrees” section of this bulletin. This degree is recommended for those who expect to engage in a professional career in research, teaching, or technical work of an advanced nature. The Ph.D. program is rigorous and should be undertaken only by students with ability for independent work. It requires a minimum of three years (nine quarters) of graduate study, at least two years of which must be at Stanford and a minimum GPA of 3.0 in post-MS course work. Experience has shown that few students complete the Ph.D. within the minimum residence period. Prospective doctoral students should anticipate the possibility of at least one extra year. All candidates for the Ph.D. degree are required to complete CEE 200 in conjunction with a one-quarter teaching assistantship/course assistantship to gain training and instructional experience. Further information about Ph.D. requirements and regulations is found in the department handbook.

The first year of graduate study can be represented by the M.S. program described above. The second year is devoted partly to additional graduate courses and partly to preliminary work toward a dissertation. The third and subsequent years are applied to further course work and to the completion of an acceptable dissertation.

The program of study is arranged by the prospective candidate at the beginning of the second year with the advice of a faculty committee whose members are nearest in the field of interest to that of the student. The chair of the committee serves as the student’s pro tem adviser until such time as a member of the faculty has agreed to direct the dissertation research. Insofar as possible, the program of study is adapted to the interests and needs of the student within the framework of the requirements of the department and the University. In the second year of graduate study, the student is expected to pass the department’s General Qualifying Examination to be admitted to candidacy. After completing their research, students are required to pass the University oral examination, which is a dissertation defense.

Ph.D. MINOR

A Ph.D. minor is a program outside a major department. A minor is not a requirement for any degree, but is available when agreed on by the student and the major and minor departments. Requirements for a minor are established by the minor department. Acceptance of the minor as part of the total Ph.D. program is determined by the major department. Application for candidacy must be approved by both the major and the minor department, and the minor department must be represented at the University oral examination.

A student desiring a Ph.D. minor in Civil and Environmental Engineering (CEE) must have a minor program adviser who is a regular CEE faculty member in the program of the designated subfield. This adviser must be a member of the student’s University oral examination committee and the reading committee for the dissertation.

The program must include at least 20 units of graduate-level course work (that is, courses numbered 200 or above, excluding special studies and thesis) in CEE completed at Stanford University. The list of courses must form a coherent program and must be approved by the minor program adviser and the CEE chair. An average GPA of at least 3.0 must be achieved in these courses.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

UNDERGRADUATE

45Q. Stanford Introductory Seminar: Affordable Housing—A Social Entrepreneurship Start-up—Preference to sophomores. The model of a social entrepreneurship start-up is used to address the social, economic, planning, and design issues that have led to the housing affordability crisis in places like the San Francisco Bay Area. Students become familiar with housing needs, policies, and resources; learn about people most in need of housing; and examine organizations that work in affordable housing. With assistance from professionals, they perform research leading to a business plan for a venture that targets one or more key affordable housing problems selected by the class. Develops skills in organization, research, development of ideas, management, teamwork, presentation, and communication. GER: 3B (DR: 9)

4 units, Spr (Paulson, Behrman)

46Q. Stanford Introductory Seminar: Fail Your Way to Success—Preference to sophomores. Students examine real-world case studies of risk and failure with an emphasis on start-ups and small business risks. The reasons behind these failures and the applications to modern societal and student issues. Emphasis is on the people involved in each example and the lessons learned regarding risk willingness and problem solving.
leadership skills, e.g., the Titanic, Challenger Shuttle, and Hyatt Regency, and case studies from the professor’s 30 years as a small business owner and construction engineer. At least four afternoon field trips to local sites. Prerequisites: creative thinking and problem-solving interests; willingness to visit chaotic construction sites.

3 units, Spr (Clough)

47Q. Stanford Introductory Seminar: Discovering Micro-Organization Theory for Fast-Paced Project Teams—Preference to sophomores. Students discover micro-organization theory for fast-paced projects and learn to manage them by running “virtual experiments” with the Virtual Design Team (VDT) computer model of project organizations. Introduces “information-processing” framework for understanding organizations performing knowledge work. Students work in teams of two to design and execute a series of computational experiments that develop and test hypotheses about the micro-organization theory of fast-paced product development teams. Enrollment limited to 12. Prerequisites: application; curiosity about how organizations work.

4 units, Win (Deierlein)

61Q. Stanford Introductory Dialogue: Big Dams, the City Hall, and the Sierra Club—Preference to sophomores. Water and environmental policy issues: the beneficial and deleterious effects of large hydraulic structures, such as dams and aqueducts; urban infrastructure and the political process; irrigation and its lobby; flood protection; protected species and the environmentalist lobby. How do we balance the conflicting needs of supplying water and protecting from floods with the desire to maintain a livable environment? Changing public perceptions: the glory and shame of big dams. Emphasis is on discussing where we have been and where we are going in the U.S.

2 units, Aut (Kitanidis)

63. Weather and Storms—Survey of daily and severe weather, and global climate. Topics: structure and composition of the atmosphere, fog and cloud formation, rainfall, local winds, global circulation, jet streams, high and low pressure systems, inversions, El Niño, La Niña, atmosphere-ocean interactions, fronts, cyclones, thunderstorms, lightning, tornados, hurricanes, pollutant transport, global climate, and atmospheric optics. GER:2a (DR:5)

3 units, Aut (Jacobson)

64. Air Pollution: From Urban Smog to Global Change—Survey of urban through global-scale air pollution. Topics: the evolution of the earth’s atmosphere, indoor air pollution, urban smog formation, effects of exposure to air pollution, visibility, acid rain, global climate change, stratospheric ozone reduction, Antartic ozone destruction, air pollution transport across political boundaries, the effects of meteorology on air pollution, and the effects of air pollution and stratospheric ozone on human exposure to ultraviolet radiation. GER:2a (DR:5)

3 units, Spr (Jacobson)

70. Environmental Science and Technology—For science and engineering majors. Introduction to environmental quality and the development of the background necessary for understanding environmental issues, controlling environmental degradation, and preserving air and water quality. Material balance concepts for tracking substances in the environment and in engineered systems. Environmental control systems for air and water quality engineering; solid and hazardous waste management and green design; environmental laws that relate to water and air quality and control of hazardous materials; the technical basis for policy and environmental risk.

3 units, Spr (Luthy)

80N. Stanford Introductory Seminar: Structures—Where Form is the Function—Preference to freshmen. What goes into designing the world’s longest bridge or tallest building? The basic principles of structural engineering and structural forms through a series of illustrated case studies. Emphasis is on how various types of structures carry loads and other essentials of good design. Field trip to some landmark structures and a competition to design, build, and test a model bridge.

4 units, Win (Deierlein)

1 unit, Aut, Win, Spr (Monismith)

100. Managing Civil Engineering Projects—Introduction to the facility life cycle and project delivery process and organization. Techniques for planning, organizing, and executing civil engineering projects from conception to completion. Project objectives (scope, quality, cost, time, and safety) from multiple perspectives throughout the facility life cycle. Time and cost planning and control, including scheduling and cost estimating techniques using information technology. Small team projects, exposure to real world projects, and individual paper. (WIM)

4 units, Aut (Haymaker)

101A. Mechanics of Materials—Introduction to beam and column theory. Normal stress and strain in beams under various loading conditions; shear stress and shear flow; deflections of determinate and indeterminate beams; analysis of column buckling; structural loads in design; strength and serviceability criteria. Lab experiments; design project. Prerequisites: 100, Engineering 14.

4 units, Win (Menun)

101B. Mechanics of Fluids—Physical properties of fluids and their effect on flow behavior; equations of motion for incompressible ideal flow, including the special case of hydrostatics; continuity, energy, and momentum principles; control volume analysis; laminar and turbulent flows; internal and external flows in specific engineering applications including pipes, open channels, wind turbines, airplane wings, and baseballs. Prerequisites: Physics 41, Mathematics 51.

4 units, Spr (Monismith)

101C. Geotechnical Engineering—Introduction to the basic principles of soil mechanics. Soil classification, shear strength and stress-strain behavior of soils, consolidation theory, analysis and design of earth retaining structures, introduction to shallow and deep foundation design, slope stability. Lab projects. Prerequisites: Engineering 14. Recommended: 101A.

4 units, Aut (Borja)

101D. Seminar on Mathematical Laboratory Applications in Civil and Environmental Engineering—(Graduate students register for 201D.) Preference to juniors majoring in civil or environmental engineering. Use of commercial professional software in the design and analysis of civil and environmental engineering systems. MATLAB is applied to relevant problems and issues that students encounter in subsequent courses and in engineering practice. Limited enrollment.

2 units, Win (Kitanidis)

101E. Analytical and Numerical Methods for the Environment—(Graduate students register for 201E.) Develops a working knowledge of the analytical and numerical techniques needed to solve a range of environmental problems. Application of these techniques to specific environmental problems. Governing equations plus appropriate boundary and/or initial conditions are derived from the physical contexts. Application of ordinary differential equation methods. Introduction to: method of characteristics, partial differential equation models of physical phenomena and solution of the models, solution of sets of linear and nonlinear equations, modeling of systems with uncertain inputs and data, role of probability. Prerequisites: 101B, 101D, Engineering 155A, or equivalents.

4 units, Aut (Street)

102. Legal Context of Civil Engineering—Introduction to the U.S. legal system as it applies to civil engineering and construction. Fundamental concepts of contract and tort law, claims, risk management,
business formation and licensing, agency, insurance and bonding, and real property.

3 units, Win (London)

111. 3D and 4D Modeling of Civil Engineering Projects—(For undergraduates; same as 211.) Modeling, visualization, and graphical communication of civil engineering artifacts, 3D CAD, 4D modeling, introduction to underlying computer representations, applications of 3D CAD in design and construction, lab exercises, class project.
3 units, Win (Liston)

114. Symbolic Modeling in Engineering—(For undergraduates; same as 214.) Prerequisite: Computer Science 106A or equivalent.
4 units, Win (Kunz)

122A. Computer Integrated Architecture/Engineering/Construction (A/E/C)—Undergraduates serve as apprentices in 222A; see 222A. Enrollment limited and based on interviews.
2 units, Win (Fruchter)

122B. Computer Integrated Architecture/Engineering/Construction (A/E/C)—Undergraduates serve as apprentices in 222B; see 222B. Enrollment limited and based on interviews.
2 units, Spr (Fruchter)

141. Design and Construction of Concrete Canoe for ASCE Competition—Design, construction, and testing of canoe; structural and hydrodynamic analysis; selection of materials and construction methods; participation in regional canoe race.
1 unit, Aut, Win, Spr (Staff)

147. Cases in Personality, Leadership, and Negotiation—Graduate students register for 247; see 247.
3 units, Spr (Clough)

148. Design and Construction of Affordable Housing—Planning, design, engineering, and construction in the development of affordable housing. Topics: the socio-economic context of affordable housing; stages in property development; issues in design; types of structures, methods, and materials used in housing construction; and property management. Students apply what they learn in assignments where they interact with non-profit housing development, city planning officials, and architects. Prerequisites: junior or senior in Civil or Environmental Engineering, Urban Studies, or related fields.
4 units, Win (Paulson)

153. Construction Equipment and Methods—Methods to build projects planned by engineers and architects. Application of engineering fundamentals to the selection and design of equipment and systems to carry out production operations in construction; analysis of production output and costs; application of engineering economy to equipment and process decision making. Prerequisites: 100; Engineering 14, 60.
3 units, Spr (Paulson)

154. Cases in Estimating Costs—Graduate students register for 254; see 254.
3 units, Aut (Clough)

156. Building Systems Design—(Graduate students register for 256.) Design concepts, integration issues, materials of construction, and installation operations for conventional building systems. Lectures and group projects on heating, ventilation, and air conditioning systems. Student groups analyze selected building systems on active projects, and report on existing design, a redesigned portion of a system, materials of construction, and installation.
3 units, Win (Tatum)

160. Mechanics of Fluids Laboratory—Lab experiments/demonstrations illustrate conservation principles and flows of real fluids. Corequisite: 101B.
2 units, Spr (Monismith)

161. Open Channel and Pipe Flows—Introduction to the movement of water through natural and engineered channels, rivers, and pipe systems. Basic equations and theory (mass, momentum, and energy equations) for steady and unsteady descriptions of the flow. Discussion of theory and practice for the choice of pumps and the design of pumping systems. Application of theory to the design of flood-control and water-supply systems. Case studies dealing with flood-control issues in Palo Alto. Lab experiments illustrate concepts developed in class. Prerequisites: 101B, 160. Corequisite 101E.
4 units, Aut (Fong)

162. Hydrology and Water Resources—Introduction to the movement of water through natural and constructed environments. Storage and fluxes of water through the natural environment. Hydrologic processes, including precipitation, evaporation, transpiration, snowmelt, infiltration, subsurface flow, runoff, and streamflow. Emphasis is on measurement, data analysis, modeling, and the role of hydrologic processes in ecosystems. Technological systems associated with human use of water as a resource. Irrigation, hydroelectric power generation, rural and urban water supply systems, stormwater management, flood damage mitigation, water law and institutions. Emphasis is on engineering design and environmental impacts. Required field trips. Prerequisites: 161, Engineering 60.
4 units, Win (Freyberg)

164. Introduction to Physical Oceanography—(Same as Earth Systems 164.) Introduction to the dynamical basis of physical oceanography. Topics: a general description of the physical environment of the ocean; conservation equations for salt, heat, and momentum; geostrophic flows; wind-driven flows; the Gulf Stream; equatorial dynamics and ENSO; the thermohaline circulation of the deep oceans; and tides. Prerequisite: Physics 41.
4 units, Aut (Monismith)

169. Environmental and Water Studies Design—Seniors in Civil or Environmental Engineering only; alternates with 179B. The design of environmental and water resources systems. Design as a process. Application of fluid mechanics, hydrology, water resources, environmental sciences, planning, and engineering economy fundamentals to the design of an engineering system addressing a complex problem of water in the natural and constructed environment. The problem changes each time, generally drawn from a challenge confronting the University or a local community. Previous problems have included sediment management in Searsville Lake, improved operation of Lagunita, and a remedial design for the Santa Rosa outfall in San Pablo Bay. Student design teams prepare proposals, progress reports, oral presentations, and a final design report. Prerequisite: 162.
5 units, alternate years, given 2001-02

171. Environmental Planning Methods—For juniors and seniors. Use of microeconomics and mathematical optimization theory in the design of environmental regulatory programs; tradeoffs between equity and efficiency in designing regulations; techniques for predicting visual, noise, and traffic impacts in environmental impact assessments. Prerequisites: 70, Mathematics 51.
3 units, Win (Ortolano)

172. Air Quality Management—Quantitative introduction to the engineering methods used to study and seek solutions to current air quality problems. Topics: global atmospheric changes, urban sources of air pollution, indoor air quality problems, design and efficiencies of pollution control devices, and engineering strategies for managing air quality. Prerequisites: 70, Mathematics 51.
3 units, Win (Hildemann)
173A. Energy Resources—(Formerly Petroleum Engineering 103; same as Earth Systems 103.) Overview of oil, natural gas, coal, nuclear, hydro, solar, geothermal, biomass, wind, and ocean energy resources in terms of supply, distribution, recovery and conversion, environmental impacts, economies, policy, and technology. The opportunities for energy efficiency, electric power basics, the changing role of electric utilities, transportation basics, and energy use in developing countries. Field trips. Recommended: 70.
4 units, Aut (Woodward)

173B. Seminar: The Coming Energy—(Formerly Petroleum Engineering 104; graduate students register for 207.) The three forces driving an energy revolution: environmental pressures, global social and economic revolution, and technological change. Assessment of evolution vs. revolution, developed vs. developing countries, transportation, electric power, resource development and extraction, end use technologies, deregulation, privatization and globalization, barriers to change, and assessment of the mechanisms to overcome them. Enrollment limited to 15; presentations every class. Prerequisite: 173A.
3 units (Woodward) alternate years, given 2001-02

5 units, Spr (Goulder)

4 units, Win (Masters) alternate years not given 2001-02

176B. Electric Power: Renewables and Efficiency—Electric utility systems: generation, transmission, distribution, regulation, and power quality. Emphasis is on photovoltaics, wind turbines, and fuel cells on the supply side, and efficient lighting systems and electric motors on the demand side. Lab.
4 units (Masters) alternate years, given 2001-02

177. Aquatic Chemistry and Biology—Undergraduate-level introduction to the chemical and biological processes in the aquatic environment. Basic aqueous equilibria; the structure, behavior, and fate of major classes of chemicals that dissolve in water; redox reactions; the biochemical exposure to toxic chemicals in the environment. Pollutant behavior, inhalation exposure, dermal exposure, and assessment tools. Overview of the complexities; uncertainties; and physical, chemical and biological issues relevant to risk assessment. Lab projects. Prerequisite: Mathematics 51. Recommended: 172.
3 units, Spr (Leckie)

178. Introduction to Human Exposure Analysis—(Graduate students register for 276.) Scientific and engineering issues involved in quantifying human exposure to toxic chemicals in the environment. Pollutant behavior, inhalation exposure, dermal exposure, and assessment tools. Overview of the complexities; uncertainties; and physical, chemical and biological issues relevant to risk assessment. Lab projects. Prerequisite: Mathematics 51. Recommended: 172.
3 units, Spr (Leckie)

179A. Water Chemistry Laboratory—(Same as 273A.) For undergraduates. Laboratory application of techniques for the analysis of natural and contaminated waters, emphasizing instrumental techniques.
2 units, Win (Leckie)

179B. Process Design for Environmental Biotechnology—Alternates with 169. Preference given to juniors and seniors in Civil or Environmental Engineering. The design of a water or wastewater treatment system using biological processes to remove contaminants. Student teams characterize contaminants in water or wastewater, design and operate bench- and pilot-scale units, then develop a full-scale design. Limited enrollment. Prerequisites: 177, 179A.
3 units, Spr (Criddle), alternate years, not given 2001-02

180. Structural Analysis—(Formerly 180A.) Analysis of beams, trusses, frames; method of indeterminate analysis by consistent displacement, least work, superposition equations, moment distribution. Introduction to matrix methods and computer methods of structural analysis. Prerequisite: 101A.
4 units, Aut (Kiremidjian)

181. Design of Steel Structures—Concepts of the design of steel structures with a load and resistance factor design (LRFDFD) approach; types of loading; structural systems; design of tension members, compression members, beams, beam-columns, and connections; and design of trusses and frames. Comprehensive project on the structural design of an industrial building. Prerequisite: 180.
4 units, Win (Low)

182. Design of Reinforced Concrete Structures—Properties of concrete and reinforcing steel; behavior of structural elements subject to bending moments, shear forces, torsion, axial loads, and combined actions; design of beams, slabs, columns and footings; strength design and serviceability requirements; design of simple structural systems for buildings. Comprehensive project on the structural design of a reinforced concrete office building. Prerequisite: 180.
4 units, Spr (Krawinkler)

185. Structural Geology and Rock Mechanics—(Same as Geological and Environmental Sciences 111.) Observational techniques, analysis methods, and theoretical foundations of structural geology, engineering geology, and rock mechanics. Computer exercises are integrated with field data to understand the role of geologic structures in the evolution of the earth's crust (folding, faulting, flow, and fracturing of rock) and geologic hazards (earthquakes, landslides, and volcanoes). Topics: structural quantities and dimensional analysis; use of stress, strain, displacement, and velocity fields in structural analysis; the concept and measurement of deformation; mechanical properties of rock (elasticity, viscosity, strength, friction, fracture toughness); case studies of typical geologic structures using continuum mechanics. Computer labs. Prerequisites: Geological and Environmental Sciences 1, calculus, Macintosh skills.
5 units, Aut (Pollard)

186. Engineering Geology Practice—(Same as Geological and Environmental Sciences 115.) The application of geologic fundamentals to the planning and design of civil engineering projects. Emphasis is on development of geologic skills to identify, describe, and map earth materials and geologic structures as a means of determining the impact on site development. Topics: weathering and soil-forming processes, soil and rock mechanics, site investigation techniques, surface and groundwater regimes, stream and coastal processes, quaternary teconics, deposits and geomorphology, environmental concerns, and geologic and geotechnical hazards. Field/lab exercises and case history studies emphasize the impact of site geology on the safety, design, and construction of civil engineering projects such as foundations, transportation facilities, excavations, tunnels and underground storage space, water supply facilities, and marine works. Prerequisite: 195 or consent of instructor.
3 units (Holzer) alternate years, not given 2001-02

197. Professional Development Seminar—Weekly presentations by practicing engineers on topics relevant to students planning to enter the engineering profession. Environmental, structural, and construction perspectives.
1 unit, Win (Tatum)

199. Undergraduate Research in Civil and Environmental Engineering—Participation in a research project in Civil and Environmental
Engineering. Written report or oral presentation required. Students must obtain a faculty sponsor.

2-3 units, any quarter (Staff)

PRIMARILY FOR GRADUATE STUDENTS

200A,B,C. Teaching of Civil and Environmental Engineering—Required of all CEE Ph.D. students. Strategies for effective teaching and introduction to engineering pedagogy. Topics: problem solving techniques and learning styles, individual and group instruction, the role of TAs, balancing other demands, grading. Teaching exercises. Register for quarter of teaching assistantship.

200A. 1 unit, Aut (Staff)
200B. 1 unit, Win (Staff)
200C. 1 unit, Spr (Staff)

201D. Seminar on Mathematical Laboratory Applications in Civil and Environmental Engineering—Undergraduates register in 101D; see 101D.

2 units, Win (Kitanidis)

201E. Analytical and Numerical Methods for the Environment—Undergraduates register for 101E; see 101E.

4 units, Aut (Street)

203. Probabilistic Models in Civil Engineering—Introduction to probability modeling and statistical analysis in civil engineering. Emphasis is on the practical issues of model selection, interpretation, and calibration. Recognition of intrinsic randomness and modeling uncertainty. Introduction to probability event and decision trees. Models of independent events; hazard rate models. Introduction to computational methods including Monte Carlo simulation and second-moment and full-distribution methods derived from structural reliability theory.

3-4 units, Aut (Menun)

3-4 units (Menun) alternate years, given 2001-02

207. Seminar: The Coming Energy Revolution—Undergraduates register for 173B; see 173B.

3 units, Woodward, alternate years, given 2001-02

211. 3D and 4D Modeling of Civil Engineering Projects—Undergraduates register for 111.) See 111.

3 units, Win (Liston)

214. Symbolic Modeling in Engineering—(Same as 114.) Issues concerning symbolic model-based reasoning systems in engineering. Lab to study and create symbolic models using Artifical Intelligence representation and reasoning techniques, and engineering principles and heuristics. Prerequisite: Computer Science 106A or equivalent.

4 units, Win (Kunz)

215. Social Entrepreneurship—(Same as Business 369S.) The efforts of private citizens to create effective responses to social needs and innovative solutions to social problems. Social entrepreneurs are increasingly blurring lines between the sectors, using for-profit and hybrid forms of organization to achieve social objectives. This creates new opportunities for applying business skills in the social sector. Objectives; introduce the concepts, practices, and challenges of social entrepreneurship in the U.S. and the world; provide frameworks and tools to become effective in their socially entrepreneurial pursuits; and engage students in a joint learning process.

4 units, Spr (Dees)

221. Project-Based Design/Construction Integration—Using examples from current construction projects in the Bay Area, students develop an understanding of the goals and concerns of each stakeholder in the facility development process. Emphasis is on the development of skills to identify, describe, and document important design and construction aspects of various types of projects. Integration issues are identified and discussed. Required construction field trips.

2 units, Aut (Miranda)

222A. Computer Integrated Architecture/Engineering/Construction (A/E/C)—Multi-disciplinary, collaborative, multi-site teamwork project environment. Round table A/E/C panel discussions, lectures, and labs on collaborative technologies provide a global perspective of the A/E/C industry and cutting edge information technologies. Students exercise the acquired theoretical discipline knowledge and the information technologies in a multi-disciplinary, collaborative context, and engage in hands-on case study projects to redesign parts of existing projects and work on the concept development phase of the comprehensive course project.

3 units, Win (Fruchter)

222B. Computer Integrated Architecture/Engineering/Construction (A/E/C)—Continuation of 222A. Students focus on the comprehensive team project, including project development and documentation, and final presentation of results. Design and construction alternatives are subject to rigorous examination by rapid computational prototyping, concurrent multi-disciplinary evaluation, and trade-off analysis. Prerequisite: 222A.

2 units, Spr (Fruchter)

223. Issues in Design/Construction Integration—The impact of design decisions on construction, with emphasis on integration issues. Topics: analysis of various delivery project alternatives; design and constructability of steel and concrete structural connections; design and detailing of penetrations through structural members required by various building systems, loads during construction and their possible impact on design, and examples of challenging erection problems. Required construction field trips.

3 units, Spr (Miranda)

237. Introduction to Biotechnology—(Same as Biochemistry 237, Chemical Engineering 450, Developmental Biology 237, Structural Biology 237.) Faculty from the departments of Biochemistry, Biological Sciences, Chemical Engineering, Civil and Environmental Engineering, Developmental Biology, Structural Biology, and invited industrial speakers review the interrelated elements of modern biotechnology. Topics: protein structure and dynamics, protein engineering, biocatalysis, gene expression, cellular metabolism and metabolic engineering, fermentation technology, and purification of biomolecules. Prerequisite: graduate student or upper-division undergraduate in the sciences or engineering.

3 units, Spr (Robertson, Swartz)

238. Frontiers in Interdisciplinary Biosciences—(Cross-listed in multiple departments in the schools of Humanities and Sciences, Engineering, and Medicine; students should enroll directly through their affiliated department, if at all possible.) Introduction to cutting-edge research involving interdisciplinary approaches to bioscience and biotechnology; for specialists and non-specialists. Associated with Stanford’s Clark Center for Interdisciplinary Bioscience, and held in conjunction with a seminar series meeting twice monthly during 2000-01. Leading investigators from Stanford and throughout the world speak on their research; students also meet separately to present and discuss the ever-changing subject matter, related literature, and future directions. Prerequisite: keen interest in all of science, with particular interest in life itself. Recommended: basic knowledge of biology, chemistry, and physics.

2 units, Aut, Win, Spr (S. Block)
258B. 1 unit, Win (Paulson)
258C. 1 unit, Spr (Levitt)

259A, B, C. Construction Problems—Analysis of group-selected problems in construction techniques, equipment, or management, followed by preparation of oral and/or written reports. Students consult specialists from the construction industry and make use of University facilities. See 299 for alternative individual studies. Prerequisites: graduate standing in construction and consent of instructor.

259A. 1-3 units, Aut (Staff)
259B. 1-3 units, Win (Staff)
259C. 1-3 units, Spr (Staff)

260A. Physical Hydrogeology—(Same as Geological and Environmental Sciences 230.) Theory of underground water, analysis of field data and pumping tests, geologic groundwater environments, solution of field problems, groundwater modeling. Introduction to groundwater contaminant transport and unsaturated flow. Lab. Prerequisite: elementary calculus.

3-4 units, Aut (Gorelick)
3-4 units, Win (Staff)

4 units (Loague) alternate years, given 2001-02

260C. Contaminant Hydrogeology—(Same as Geological and Environmental Sciences 231.) For earth scientists and engineers interested in environmental and water resource problems involving contaminated groundwater. The processes affecting contaminant migration through porous media, including interactions between dissolved substances and solid media. Conceptual and quantitative treatments of advective-dispersive transport with reacting solutes. Predictive models of contaminant behavior controlled by local equilibrium and kinetics. Modern methods of contaminant transport simulation and optimal aquifer remediation. Recommended: 260A.

4 units, Spr (Gorelick)

261. Watershed and Wetlands Hydrology—Graduate seminar focusing on the hydrologic processes underlying the functioning, management, and restoration of important ecosystems. Possible topics: the hydrology of tidal salt and freshwater marshes, inland freshwater wetlands, riparian zones, wetland and upland forests, agricultural or urban watersheds. Readings from texts and journal literature. Each student prepares a research proposal on the quarter’s topic. Enrollment limited. Prerequisite: consent of instructor. Recommended: 162, 260A, or equivalents.

3 units, Spr (Freyberg)

262A. Environmental Fluid Mechanics—The flow of incompressible viscous fluid; emphasis is on developing an understanding of fluid dynamics that can be applied to environmental flows. Topics: kinematics of fluid flow; equations of mass and momentum conservation (including density variations); some exact solutions to the Navier-Stokes equations; appropriate analysis of fluid flows including Stokes flows, potential flows, and laminar boundary layers; and an introduction to the effects of rotation and stratification through scaling analysis of fluid flows. Prerequisites: 101B or consent of instructor, and some knowledge of vector calculus.

3-4 units, Aut (Kossov)

3-4 units, Win (Staff)

262C. Modeling Environmental Flows—Introduction to turbulence models, and to basic concepts of numerical simulation and computer modeling of turbulent flows. Application of models to open channel, estuary, and lake/reservoir simulations. Use of computer models for estuarine hydrodynamics, lake/reservoir dynamics, and stream water quality. The effects of rotation and stratification. Prerequisites: 262A, or consent of instructor.

3-4 units, Spr (Street)

263A. Air Pollution Modeling—Introduction to the numerical modeling of urban, regional, and global air pollution with a focus on gas chemistry and radiative transfer. Stratospheric, free-tropospheric, and urban chemistry. Methods for solving stiff systems of chemical ordinary differential, including the Multistep Implicit-Explicit method, Gear’s method with sparse-matrix techniques, and the family method. Numerical methods of solving radiative transfer, coagulation, condensation, and chemical equilibrium problems. Project involves the development of a basic chemical ordinary differential equation solver. Prerequisite: Computer Science 106A or equivalent.

3-4 units, Win (Jacobson)

263B. Numerical Weather Prediction—Introduction to numerical weather prediction. Continuity equations for air and water vapor, the thermodynamic energy equation, and momentum equations are derived for the atmosphere. Numerical methods of solving partial differential equations, including finite-difference, finite-element, semi-Lagrangian, and pseudospectral methods. Time-stepping schemes: the forward-Euler, backward-Euler, Crank-Nicolson, Heun, Matsuno, leapfrog, and Adams-Bashforth schemes. Boundary-layer turbulence parameterizations, soil moisture, and cloud modeling. Project developing a basic mesoscale model. Prerequisite: Computer Science 106A or equivalent.

3-4 units (Jacobson) given 2001-02

263C. Weather and Storms—Undergraduates register for 63; see 63. 3 units, Aut (Jacobson)

263D. Air Pollution: From Urban Smog to Global Change—Undergraduates register for 64; see 64. 3 units, Spr (Jacobson)

263S. Climate Theory, Modeling, Applications, and Implications—Enroll in Biological Sciences 217.

3 units (Schneider) alternate years, given 2001-02

264. Sediment Transport Modeling—The physical processes and modeling of sediment transport in estuaries, rivers, and coastal zones. Modeling in one-, two-, and three-space dimensions and time. Hands-on sessions with actual development, modification, and application of analytical models and numerical codes for transport. Prerequisites: 201D, 262A, or equivalents.

3 units, Win (Street)

265. Sustainable Water Resources Development—Alternative criteria for judging the sustainability of projects. Application of criteria to evaluate sustainability of water resources projects in several countries. Case studies illustrate the role of political, social, economic, and environmental factors in decision making. Evaluation of benefit-cost analysis and environmental impact assessment as techniques for enhancing the sustainability of future projects. Limited enrollment. Prerequisite: graduate standing in Environmental and Water Studies, or consent of instructor.

3 units, Win (Ortolano)
266. Environmental Policy Design and Implementation—Regulation, market incentives, the courts, and negotiation as bases for environmental management programs. Case studies involve implementation of air and water pollution control laws, hazardous waste management programs, and environment impact assessment. Limited enrollment. Prerequisite: graduate standing in Environmental and Water Studies Program or consent of instructor.

4 units (Ortolano) given 2001-02

267. Interpolation and Inverse Problems—Understanding complex hydrologic processes by using measurements, mathematical models which describe groundwater flow and solute transport, and stochastic analysis of spatial variability and uncertainty. Topics: exploratory data analysis, generalized linear minimum-variance estimation, parameter estimation (or “model calibration”), model validation, accuracy of model predictions, optimal sampling. Emphasis is on linear “geostatistical” methods of estimation. Prerequisite: background in introductory statistics and linear algebra.

3-4 units, Spr (Kitanidis)

268. Groundwater Flow—Study of flow and mass transport in porous media through analytical techniques. Applications of potential flow theory to practical groundwater problems: flow to and from wells, rivers, lakes, drainage ditches; flow through and under dams; streamline tracing; capture zones of wells; and mixing schemes for in-situ remediation. Prerequisites: calculus and introductory fluid mechanics.

3-4 units, Win (Kitanidis)

269. Water Resources Seminar—Problems in all branches of water resources, with talks by visitors, faculty, and students. (AU)

1 unit, Spr (Kitanidis)

270. Movement, Fate, and Effects of Contaminants in Surface Waters and Groundwater—Transport of chemical constituents in surface and groundwater, including advection, dispersion, sorption, interphase mass transfer, and transformation; water quality requirements for various beneficial uses. Emphasis is on the behavior of hazardous waste contaminants. Prerequisites: undergraduate chemistry and calculus. Recommended: 101B.

3 units, Aut (Luthy)

3 units, Win (Luthy)

271B. Environmental Biotechnology—Stoichiometry, kinetics, and thermodynamics of microbial processes for the transformation of environmental contaminants. Design of dispersed growth and biofilm-based processes. Applications include treatment of municipal and industrial wastewaters, detoxification of hazardous chemicals, and groundwater remediation. Prerequisites: 270, 177 or 274A (or equivalents).

4 units, Win (Cridde)

271C. Physiochemical Processes and Organic Contaminants—The major physical and chemical processes affecting anthropogenic organic compounds in aquatic systems. Review of concepts from physical organic chemistry and the relationships between chemical structure and physicochemical properties and the environmental behavior of organic compounds. The physicochemical processes important to phase partitioning, availability, transport, treatment, and abiotic transformation of specific organic compounds are addressed and applied to examples in water quality engineering, and soil and sediment quality. Prerequisite: 270.

3 units (Luthy) not given 2000-01

272. Aquatic Chemistry—(Same as Geological and Environmental Sciences 264.) Chemical principles and their application to the analysis and solution of problems in aqueous geochemistry (temperatures near 25°C and atmospheric pressure). Emphasis is on the analysis of natural water systems and the understanding and solution of specific chemical problems in water purification technology and water pollution control. Prerequisites: Chemistry 31 and 33, or equivalents.

3 units, Aut (Leckie)

273A. Water Chemistry Laboratory—Laboratory application of techniques for the analysis of natural and contaminated waters, emphasizing instrumental techniques.

2 units, Win (Leckie)

3 units, Aut (Spormann)

3 units, Win (Spormann)

274C. Environmental Microbiology Laboratory—Microbiological, biochemical, and molecular techniques for characterizing microbes: enrichment and isolation of microorganisms, metabolic and phylogenetic characterization of isolates, determination of growth parameters (growth rate, growth yield, fermentation balance), enrichment and isolation of microorganisms degrading pollutants, detection of microorganisms in the environment, water quality parameters. Horizontal gene transfer. Prerequisites: 274A, 274B.

3 units (Spormann)

274D. Pathogens and Disinfection—Introduction to epidemiology, major pathogens and infectious diseases, the immune system, movement and survival of pathogens in the environment, transfer of virulence and antibiotic resistance genes, and pathogen control, with an emphasis on public health engineering measures (disinfection). Prerequisite: 274A.

3 units (Cridde) not given 2000-01

275A. Water Quality Control Processes I—Lab and pilot plant studies of the physical and chemical processes for the treatment of water and wastewaters. Prerequisites: 271A, 273, 273A.

3 units (Leckie) alternate years, given 2001-02

275B. Environmental Biotechnology Laboratory—Design of a water or wastewater treatment system using biological processes to remove contaminants. Student teams characterize contaminants in water or wastewater, design and operate bench- and pilot-scale units, then develop a full-scale design. Prerequisites: 271B, 273A.

3 units, Spr (Cridde) alternate years, not given 2001-02
3 units, Spr (Deierlein)

3 units, Aut (Hildemann)

3 units, Spr (Hildemann)

279. Environmental Engineering Seminar—Current research, practice, and thinking in environmental engineering and science. Attendance at seminars is self-directed, and may be accrued throughout the school year. See instructor for syllabus.
1 unit, Spr (Leckie)

280. Advanced Structural Analysis—Theoretical development and computer implementation of direct stiffness method of structural analysis; virtual work principles; computation of element stiffness matrices and load vectors; direct assembly procedures; equation solution techniques. Analysis of two- and three-dimensional truss and frame structures, thermal loads, and substructuring and condensation techniques for large systems. Practical modeling techniques and programming assignments. Introduction to nonlinear analysis concepts. Prerequisites: elementary structural analysis and matrix algebra.
3-4 units, Aut (Deierlein)

281. Finite Element Structural Analysis—Introduction to the finite element method for analysis of structural systems. Formulation and implementation of frame, plane stress, plane strain, axisymmetric, torsional, solid, plate, and shell elements. Topics: strong and weak forms of the problem, variational principles and the principle of minimum potential energy, the finite element method as an extension of the Rayleigh-Ritz method, shape functions, isoparametric mapping, numerical integration, convergence requirements, and error estimation. Techniques for application to modeling structural systems. Prerequisite: 280 or equivalent.
3-4 units, Win (Lowes)

282. Nonlinear Structural Analysis—(Formerly 283.) Introduction to methods of geometric and material nonlinear analysis, emphasizing modeling approaches for framed structures. Large-displacement analysis, concentrated and distributed plasticity models, and nonlinear solution methods. Applications to frame stability and performance-based seismic design. Assignments emphasize computer implementation and applications. Prerequisites: 280, 286 or equivalent.
3 units, Spr (Deierlein)

283. Structural Dynamics—(Formerly 296A.) Vibrations and dynamic response of simple structures under time dependent loads, dynamic analysis of single and multiple degrees of freedom systems, support motion, response spectra.
3-4 units, Aut (Law)

284. Computational Methods in Structural Dynamics—Methods of structural dynamics for discretized and continuous systems in free and forced vibration, modal analysis; numerical methods; introduction to nonlinear dynamics; advanced topics. Prerequisites: 280, 283.
3 units (Law) alternate years, given 2001-02

285. Behavior of Structural Systems for Buildings—Basic design concepts, performance criteria, loading, methods of design, types of structural systems behavior under gravity and lateral loads, approximate methods of analysis, preliminary design concepts and implementation, performance assessment, behavior of structural elements. Prerequisites: basic courses in design of steel and reinforced concrete structures.
3-4 units, Aut (Krawinkler)

286. Advanced Structural Design—Strength, stiffness, and ductility considerations in the design of structural elements and systems made of steel, reinforced concrete, and other materials. Concepts of redistribution (element vs. system behavior). Introduction to performance-based design. Prerequisites: basic courses in design of steel and reinforced concrete structures, 285 or equivalent.
3-4 units, Win (Krawinkler)

287. Earthquake Resistant Design—(Formerly 284). Earthquake motions and their engineering interpretations, design spectrum and design earthquakes, dynamic analysis of structures for earthquake loading, design of structures to minimize earthquake damage, design of protective systems, retrofit of existing structures, earthquake codes. Prerequisite: 286 or consent of instructor.
3 units, Spr (Lowes)

288. Earthquake Hazard and Risk Analysis—(Formerly 282.) Earthquake phenomena, faulting, ground motion, study of past major earthquakes, effects of earthquakes on man-made structures, response spectra, Fourier spectra, power spectra, random vibration analysis of single and multi-degree of freedom systems, soil effects on ground motion and structural damage, methods for structural damage evaluation, current research in earthquake engineering. Prerequisites: 203, 283.
3 units, Win (Staff)

3-4 units, Spr (Menun) alternate years, not given 2001-02

290. Structural Performance and Failures—(Formerly 287.) Basic concepts in the definition of satisfactory structural performance; key elements in structural performance; types of failures, ranging from reduced serviceability to total collapse; failure sources and their root cause allocation, emphasizing design/construction process failures; failure prevention mechanisms; illustration with real life examples.
2 units, Spr (Moncarz)

291. Advanced Strength of Materials and Laboratory Testing—Experimental investigation and analytical modeling of new and tradi-
tional civil engineering materials. Laboratory testing to determine strength, deformation, and energy-dissipation characteristics. Review mechanics of materials, introduction to inelastic constitutive theory including plasticity theory, damage mechanics, fracture mechanics, viscoelasticity, and viscoplasticity. Readings from texts and journal literature. Possible topics: plain concrete, fiber-reinforced concrete, structural steel, fiber-reinforced composites, rubber and asphalt. Student paper discussing constitutive modeling.

3 units, Aut (Lowes)

292. Computer Methods in Structural Engineering—Introduction to basic techniques for the development of structural engineering analysis and design software. Topics: basic data structure; computer representation of engineering systems; implementation of advanced numerical methods and engineering software; automated conformance checking of design codes and standards. Prerequisites: Computer Science 106A or equivalent.

3 units, Win (Law) alternate years, not given 2001-02

293. Foundation Engineering—(Formerly 291.) Types, characteristics, analysis, and design of shallow and deep foundations; rigid and flexible retaining walls; braced excavations; settlement of footings in sands and clays; slope stability analysis by method of slices including search algorithms for the critical slip surface. Special seminars by guest speakers; computing assignment. Prerequisite: 101C or equivalent.

3 units, Win (Borja)

3 units (Borja) alternate years, given 2001-02

295. Plasticity in Geomechanics—(Formerly 290.) Theory of particulate media; micromechanics of granular materials; constitutive laws in geomechanics; plasticity; return-mapping algorithms; classical yield models. Mises, Mohr-Coulomb, Drucker-Prager; critical state theory and Cam-clay models; multi-surface and bounding surface models; localization and bifurcation theories in geomechanics. Prerequisites: 101C, Mechanical Engineering 238A, or equivalent.

3 units, Spr (Borja) alternate years, not given 2001-02

296. Experimental Soil Mechanics—(Formerly 293.) Lab determination of stress-strain-strength parameters for soils under drained and undrained loading conditions. Six lab experiments. Prerequisite: 101C or equivalent.

2 units, Win (Borja)

297. Issues in Geotechnical and Environmental Failures—(Formerly 294.) Causes and consequences of the failure of buildings, earth structures, waste storage, and high hazard facilities in contact with the environment; technical, ethical, economic, legal, and business aspects; failure analysis and forensic problems; prevention, liability, and dispute management. Case history approach based on the instructor's files including earthquake, flood, and hazardous waste facilities. Student observation, participation in active lawsuits where possible.

3 units, Spr (Meehan)

298. Structural Engineering and Geomechanics Seminar—Recommended for all graduate students. Lectures on topics of current interest in professional practice and research. (AU)

1 unit, Win (Staff)

299. Independent Study in Civil and Environmental Engineering—Directed study for graduate students on subjects of mutual interest to students and faculty. Student must obtain faculty sponsor.

1-3 units, any quarter (Staff)

300. Thesis—Investigation of an engineering problem; required of candidates for degree of Engineer.

Aut, Win, Spr (Staff)

310. Post-Master's Seminar—For post-master's students to serve as orientation to the selection of a research topic.

1 unit, Aut, Win, Spr (Staff)

320A, B, C. Integrated Facility Engineering—Individual and group presentations on goals, research, and state-of-practice of integrated facility engineering, including objectives for integrated computer systems. (AU)

1 unit, Aut, Win, Spr (Kuzn, Levitt)

342. Computational Modelling of Organizations—For post-M.S. students interested in formal techniques for organization design. Computer simulation of organizations is used to conduct "virtual experiments" for developing organization theory or to analyze the performance of "virtual organizations" with different structures and design support/communication technologies. Goals: introduce research on computational modeling and design of real-world organizations. Paper serves as a research proposal. Prerequisite: 242 or equivalent introductory organization design class.

4-5 units, Win (Levitt)

362. Advanced Topics in Subsurface Transport—Mathematical analysis of flow and transport in porous and fractured media. Topics vary each year, including: solution of flow and transport equations, stochastic analysis, homogenization, and estimation methods. Prerequisite: consent of instructor.

3 units (Kitanidis) alternate years, given 2001-02

3 units (Fong) alternate years, given 2001-02

364. Geophysical Fluid Dynamics—Focus is on fluid dynamics in natural systems where the influence of the earth's rotation is important. The basic processes such as geostrophic and quasi-geostrophic flows, planetary waves, and potential vorticity. Student-led lectures and discussions of current physical oceanographic research problems.

1 unit, Win (Monismith, Fong)

370A, B, C. Environmental Research—Introductory research experience for first-year graduate students in the Environmental Engineering and Science program pursuing the Ph.D. 15-18 hrs/week on research over a 3- or 4-yr. period. 370A requires written literature survey on a research topic; 370B requires oral presentation on experimental techniques and research progress; 370C requires written or oral presentation of preliminary doctoral research proposal. Students must obtain a faculty sponsor.

3-6 units, Aut, Win, Spr (Staff)

398. Report on Civil Engineering Training—On-the-job training under the guidance of experienced, on-site supervisors; meets the requirements for Curricular Practical Training for students on F-1 visas. Students submit a concise report detailing work activities, problems worked on, and key results. Prerequisite: written consent of adviser.

1 unit, any quarter (Staff)
**UNDERGRADUATE PROGRAMS**

The department offers both a major and a minor in Computer Science. The requirements for these programs are outlined in the "School of Engineering" section of this bulletin and described in more detail in the Handbook for Undergraduate Engineering Programs published by the School of Engineering. The department has an honors program, which is described in the following section.

In addition to Computer Science itself, Stanford offers several interdisciplinary degrees with a substantial computer science component. The Computer Systems Engineering major (also in Engineering) allows the study of issues of both computer hardware and software, bridging the gap between traditional CS and Electrical Engineering majors. The Symbolic Systems major (in the School of Humanities and Sciences) offers a chance to explore computer science and its relation to linguistics, philosophy, and psychology. Finally, the Mathematical and Computational Sciences major (also Humanities and Sciences) allows students to explore computer science along with more mathematics, statistics, and operations research.

**HONORS**

The Department of Computer Science offers an honors program for selected undergraduates whose academic records and personal initiative indicate that they have the necessary skills to undertake high-quality research in computer science. Admission to the program is by application only. To apply for the honors program, students must be majoring in Computer Science, have a grade point average (GPA) of at least 3.5 in courses that count toward the major, and achieve senior standing (135 or more units) by the end of the academic year in which they apply. Co-terminal master’s students are eligible to apply as long as they have not already received their undergraduate degree. Beyond these requirements, students who apply for the honors program must also find a faculty member who agrees to serve as the thesis adviser for the project. Thesis advisers must be members of Stanford’s Academic Council.

Students who meet the eligibility requirements and wish to be considered for the honors program must submit a written application to the departmental student program office by May 1 of the year preceding the honors work. The application must include a letter describing the research project, a letter of endorsement from the faculty sponsor, and a transcript of courses taken at Stanford. Each year, a faculty review committee will select the successful candidates for honors from the pool of qualified applicants.

In order to receive departmental honors, students admitted to the honors program must, in addition to satisfying the standard requirements for the undergraduate program, do the following:

1. Complete at least 9 units of CS 191 or 191W under the direction of their project sponsor.
2. Enroll in a research seminar, which allows students to share their experience with other students working on research projects.
3. Complete an honors thesis deemed acceptable by a committee consisting of the thesis adviser and at least one additional faculty member.
4. Present the thesis at a public colloquium sponsored by the department.
5. Maintain the 3.5 GPA required for admission to the honors program.

**GRADUATE PROGRAMS**

The University’s basic requirements for the M.S. and Ph.D. degrees are discussed in the "Graduate Degrees" section of this bulletin.

**MASTER OF SCIENCE**

In general, the M.S. degree in Computer Science is intended as a terminal professional degree and does not lead to the Ph.D. degree. Most students planning to obtain the Ph.D. degree should apply directly for admission to the Ph.D. program. Some students, however, may wish to complete the master’s program before deciding whether to pursue the Ph.D. To give such students a greater opportunity to become familiar with research, the department has instituted a new program leading to a mas-
School of Engineering

Requirement 2.
M.S. program committee other coherent programs that meet their goals.

Eight approved programs are listed below. Students may propose to the
program.

A candidate is required to complete a program of 45 units. At least 36
of these must be graded units, passed with an average 3.0 (B) grade point
average (GPA) or better. The 45 units may include no more than 21 units
of courses from those listed below. Requirements 1 and 2. Thus, students
need to take more than seven of the courses listed in Requirements 1 and 2
actually complete more than 45 units of course work in this program. Only extremely well-prepared students may expect to finish the
program in one year; most complete the program in six quarters. Students
hoping to complete the program with 45 units should already have a sub-
stantial background in computer science, including course work or ex-
perience equivalent to all of Requirement 1 and some of the courses in
Requirement 2.

Requirement 1 — The following courses may be needed as prerequi-
sites for other courses in the program: CS 103X, 107, 108; 193L (for
specialization 5 only); Electrical Engineering 182; Mathematics 109 or
120.

Requirement 2 — Students must demonstrate breadth of knowledge
in the field by completing the following courses:

1. Area A: Mathematical and Theoretical Foundations:
   a) Required:
      1) Statistics (Statistics 116 or Management Science and Engineer-
      ing 120)
      2) Algorithms (CS 161)
      3) Automata (CS 154)
   b) Choose one of:
      1) Numerical Analysis (CS 137 or 237A)
      2) Logic (CS 157, 257, 258, or Philosophy 160A)

2. Area B: Computer Systems:
   a) Required: Architecture (Electrical Engineering 182 or 282)
   b) Choose two of:
      1) Operating Systems (CS 140)
      2) Compilers (CS 143)
      3) Introduction to Computer Networks (CS 244A or Electrical
      Engineering 284)

3. Area C: AI and Applications:
   a) Choose two of the following, with at least one 200-level course:
      1) AI (CS 121 or 221)
      2) Databases (CS 145 or 245)
      3) Graphics (CS 148 or 248)

   Individual specializations are free to narrow the set of choices in spe-
cific areas of the breadth requirement; see the individual specialization
sheets in the department office for details. Breadth courses are waived
only if evidence is provided that similar or more advanced courses have
been taken, either at Stanford or another institution. Courses that are
waived rather than taken may not be counted toward the M.S. degree.
Breadth courses may be taken on a Satisfactory/No Credit basis provided
that a minimum of 36 graded units is presented within the 45-unit
program.

Requirement 3 — At least 1 but no more than 3 units of 500-level sem-
inars must be taken.

Requirement 4 — A program of 21 units in an area of specialization
must be completed. All courses in this area must be taken for letter grades.
Eight approved programs are listed below. Students may propose to the
M.S. program committee other coherent programs that meet their goals
and satisfy the basic requirements. Students who want to include a sub-
stantial research project as part of their degree program can arrange with
their adviser to replace units in their specialization with a CS 393 (Com-
puter Laboratory) project.

1. Numerical Analysis/Scientific Computation
   a) CS 237A, 237B, 237C
   b) At least two of: CS 260; Manage. Sci. & Engr. 121; Math.
      131, 132, 220A, 220B, 220C; Stat. 200
   c) At least three of: CS 223A, 238, 326A, 327A, 328, 336, 337,
      339; Aero. & Astro. 214A, 214B; Mech. Engr. 235A, 254;
      Stat. 227

2. Systems
   a) CS 240, 242
   b) At least three of: CS 243, 244A, 245, 248, 348B; Elect. Engr.
      271, 275, 382
   c) At least 6 more units selected from 'b' and from the following:
      CS 194, 214, 244B, 244C, 248V, 249, 255, 315A, 315B, 341,
      342, 343, 344, 345, 346, 347, 348A, 348C, 349, 448; Elect.
      Engr. 183, 272, 281, 318, 319, 374, 384A, 384B, 384C, 482A,
      482B, 487, 488, 489; Psych. 267

3. Software Theory
   a) CS 242, 243, 256, 258
   b) At least one of: CS 244A, 245, 342, 343, 345
   c) At least one course from the following: CS 255, 261, 351,
      355, 356, 361A, 361B, 365, 368
   d) At least one additional course selected from '3b,' '3c,' CS
      346

4. Theoretical Computer Science
   a) CS 256, 258, 261 (361A, 361B, or 365 may be used as substitutes
      for 261)
   b) At least 12 more units from CS 228, 255, 345, 351, 352, 353,
      355, 356, 357, 358, 359*, 361A, 361B, 365, 367A, 367B, 368,
      369*; Manage. Sci. & Engr. 310

5. Artificial Intelligence
   a) At least four of: CS 222, 223A, 223B, 224M, 224N, 227, 228,
      229, 326A
   b) A total of 21 units from the above and from the following:
      CS 205, 206, 225A, 225B, 226, 256, 257, 270A, 271, 274, 323,
      327A, 328, 329, 354, 377, 379, 426

6. Database
   a) CS 245
   b) Two of: CS 345, 346, 347
   c) Four additional courses selected from '6b' and from the
      following: CS 222, 240, 242, 243, 244A, 244B, 244C, 249,
      Elect. Engr. 489

7. Human-Computer Interaction
   a) CS 147, 247A, 247B
   b) At least 6 units from: CS 148 or 248, 377 (may be taken
      repeatedly), 378, 447
   c) A total of 21 units from the above and from the following:
      Comm. 269, 272; CS 249, 270A, 270B, 272, 320, 348A, 348B,
      448; Engr. 145; Manage. Sci. & Engr. 234, 273, 280, 284;
      Linguistics 238; Mech. Engr. 101, 115, 215, 313; Psych. 203,
      205, 221, 266, 267

8. Real-World Computing
   a) At least two of: CS 223A, 223B, 248
   b) At least three of: CS 205, 237A, 237B, 237C, 248V, 249, 270A,
      270B, 271, 272, 326A, 348A, 348B, 368
   c) A total of 21 units from the above and from the following:
      267

* With consent of Specialization chair.

Requirement 5 — Additional elective units must be technical courses
(numbered 100 or above) related to the degree program and approved by
the adviser. Elective courses may be taken on a Satisfactory/No Credit
basis provided that a minimum of 36 graded units are presented within
the 45-unit program.
MASTER OF SCIENCE WITH DISTINCTION IN RESEARCH

A student who wishes to pursue the M.S./CS with distinction in research must first identify a faculty adviser who agrees to supervise and support the research work. The research adviser must be a member of the Academic Council and must hold an appointment in Computer Science. The student and principal adviser must also identify another faculty member, who need not be in the Department of Computer Science, to serve as a secondary adviser and reader for the research report. In addition, the student must complete the following requirements beyond those for the regular M.S./CS degree:

1. **Research Experience:** the program must include significant research experience, at the level of a half-time commitment over the course of three academic quarters. In any given quarter, the half-time research commitment may be satisfied by a 50 percent appointment to a departmentally supported research assistantship, 6 units of independent study (CS 393, 395, or 399), or a prorated combination of the two (such as a 25 percent research assistantship supplemented by 3 units of independent study). This research must be carried out under the direction of the primary or secondary adviser.

2. **Supervised Writing and Research:** in addition to the research experience outlined in the previous requirement, students must enroll in at least 3 units of independent research (CS 393, 395, or 399) under the direction of their primary or secondary adviser. These units should be closely related to the research described in the first requirement, but focused more directly on the preparation of the research report described in the next section. Note that these units must be taken in addition to the 21 units required for the specialization, although they do not count toward the 45 units required for the degree.

3. **Research Report:** students must complete a significant report describing their research and its conclusions. The research report represents work that is publishable in a journal or at a high-quality conference, although it is presumably longer and more expansive in scope than a typical conference paper. Three copies of the research report must be submitted to the Student Services office in the department three weeks before the beginning of the examination period in the student’s final quarter. Both the primary and secondary adviser must approve the research report before the “distinction in research” designation can be conferred.

DOCTOR OF PHILOSOPHY

Applications to the Ph.D. program and all supporting documents must be received before December 15, 2000. The following are department requirements (see the Computer Science graduate programs administrator for further details, or visit www.cs.stanford.edu/admissions):

1. A student should plan and successfully complete a coherent program of study covering the basic areas of computer science and related disciplines. The student’s adviser has primary responsibility for the adequacy of the program, which is subject to review by the Ph.D. program committee.

2. Each student, to remain in the Ph.D. program, must satisfy the breadth requirement covering introductory level graduate material in major areas of computer science. Once a student fulfills six of eight whole areas of the breadth requirement, he or she may apply for admission to candidacy for the Ph.D. This is typically done by the end of the second year in the program. The student must completely satisfy the breadth requirement by the end of nine quarters (excluding summers), and must pass a qualifying exam in the general area of the expected dissertation.

3. As part of the training for the Ph.D., the student is required to complete at least 4 units (a unit is 10 hours per week for one quarter) as a teaching assistant or instructor for courses in Computer Science numbered 100 or above.

4. The most important requirement is the dissertation. After passing the qualifying examination, each student must secure the agreement of a member of the department faculty to act as the dissertation adviser. (In some cases, the dissertation adviser may be in another department.)

5. The student must pass a University oral examination in the form of a defense of the dissertation. It is usually held after all or a substantial portion of the dissertation research has been completed.

6. The student is expected to demonstrate the ability to present scholarly material orally, both in the dissertation defense and by a lecture in a department seminar.

7. The dissertation must be accepted by a reading committee composed of the principal dissertation adviser, a second member from within the department, and a third member chosen from within the University. The principal adviser and at least one of the other committee members must be Academic Council members.

Ph.D. MINOR

For a minor in Computer Science, a candidate must complete 20 units of computer science course work, including at least three of the master’s core courses to provide breadth, and one course numbered 300 to provide depth. The remaining courses must be numbered 200 or above. One of the courses taken must include a significant programming project to demonstrate programming proficiency. A grade point average (GPA) of 3.0 or better must be maintained.

TEACHING AND RESEARCH ASSISTANTSHIPS

Graduate student assistantships are available. Half-time assistants receive a tuition scholarship for 9 units per quarter during the academic year, and in addition receive a monthly stipend.

Duties for half-time assistants during the academic year involve approximately 20 hours of work per week. Teaching assistants (TAs) help an instructor teach a course by conducting discussion sections, consulting with students, grading examinations, and so on. Research assistants (RAs) help faculty and senior staff members with research in computer science. Most teaching and research assistantships are held by Ph.D. students in the Department of Computer Science. If there is an insufficient number of Ph.D. students to staff teaching and research assistantships, then these positions are open to a limited number of master’s students in the department. However, master’s students should not plan on being appointed to an assistantship.

Students with fellowships may have the opportunity to supplement their stipends by serving as graduate student assistants.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirement.

(AU) indicates that the course is subject to the University Activity Unit limitations (8 units maximum).

GUIDE TO SELECTING INTRODUCTORY COURSES

Students arriving at Stanford have widely differing backgrounds and goals, but must find that the ability to use computers effectively is beneficial to their education. The department offers many introductory courses to meet the needs of these students.

For students whose principal interest is an exposure to the fundamental ideas behind computer science and programming, CS 105 is the most appropriate course. It is intended for students in nontechnical disciplines who expect to make some use of computers, but who do not expect to go on to more advanced courses. CS 105 meets the Area 2b General Education Requirement and includes an introduction to programming, and the use of modern Internet-based technologies. Students interested in learning to use the computer should consider CS 1C (Introduction to Computing at Stanford) or 1U (Introduction to Unix).

Students who intend to pursue a serious course of study in computer science may enter the program at a variety of levels, depending on their background. Students with little prior experience or those who wish to take more time to study the fundamentals of programming should take 106A followed by 106B. Students in 106A need not have prior programming experience. Students with significant prior exposure to programming or those who want an intensive introduction to the field should take
106X, which covers most of the material in 106A and B in a single quarter. All instruction in CS 106 uses ANSI C, although the prior programming experience required for 106X may be in any language. In all cases, students are encouraged to discuss their background with the instructors responsible for these courses.

After the introductory sequence, Computer Science majors and those who need a significant background in computer science for related majors in engineering should take 103, 107 and 108. CS 103 offers an introduction to the mathematical and theoretical foundations of computer science. CS 107 exposes students to a variety of programming paradigms that illustrate critical strategies used in systems development; 108 builds on this material, focusing on the development of large interactive programs based on the object-oriented programming paradigm.

In summary:
For exposure—1C or 1U
For nontechnical use—105
For scientific use—106A
For a technical introduction—106A
For significant use—106A,B or 106X, along with 103, 107, and 108

NUMBERING SYSTEM
The first digit of a CS course number indicates its general level of sophistication:
0-99 service courses for nontechnical majors
100-199 other service courses, basic undergraduate
200-299 advanced undergraduate/beginning graduate
300-399 advanced graduate
400-499 experimental
500-599 graduate seminars

The tens digit indicates the area of Computer Science it addresses:
00-09 Introductory, miscellaneous
10-19 Hardware Systems
20-29 Artificial Intelligence
30-39 Numerical Analysis
40-49 Software Systems
50-59 Mathematical Foundations of Computing
60-69 Analysis of Algorithms
70-79 Typography and Computational Models of Language
90-99 Independent Study and Practicum

NONMAJOR

1C. Introduction to Computing at Stanford—For those with limited experience on computers. Introduction to the basics of computing, and a variety of programs, encouraging individual exploration of the programs covered. Topics: word processing, spreadsheets, using the WWW and the Internet, and computing resources at Stanford. Macintosh and PC systems. One-hour lecture/demonstration in dormitory clusters. Weekly short assignments and a final project. Not a programming course.
1 unit, Aut (Staff)

II. The Internet—For a computer-literate but not technical audience. What is the Internet and what is it good for? The foundations, resources, and uses of the Internet, emphasizing practical skills for finding, reading, and authoring Internet material. Topics: HTML, FTP, HTTP, web publishing and searching; evolution and future directions; security and privacy issues. Programming-oriented course is 193I. Prerequisites: basic computer skills at level of 1C, e.g., file editing, and access to a computer on the Internet.
1 unit, Win (Staff)

1U. Introduction to Unix—Tutorial on using the Unix operating system. Topics: text editors, the file system, the C shell, standard Unix utilities, PERL. Includes simple shell programming, but is not a programming course and assumes no prior exposure to programming.
1 unit, Spr (Staff)

50. Problem Solving with Mathematica—For engineers, physicists, mathematicians, and others who need to solve mathematical or quantitative problems. Comprehensive introduction to Mathematica, an interactive mathematical software package that includes a high-level programming language. Symbolic, numerical, graphical, animation, and programming capabilities, including use of Mathematica to manipulate expressions, find roots, solve differential equations, visualize functions and data, import and export data in arbitrary formats, work with expressions in standard mathematical notation, and perform statistical analyses.
2 units (Williams) alternate years, not given 2001-02

51. Introduction to Quantum Computing and Quantum Information Theory—For computer scientists, physicists, mathematicians, engineers, and others who want to learn the capabilities of quantum computers and the necessary quantum mechanics and complexity theory. Topics: quantum algorithms (including Shor's polynomial time algorithm for integer factorization, Grover's database search algorithm, quantum tree search, quantum wavelets), quantum information theory, quantum cryptography, breaking the RSA cryptosystem, quantum teleportation, circuit design, quantum error correction, and examples of prototype quantum computers. Prerequisites: familiarity with elementary matrix algebra and complex numbers.
2 units, Win (Williams)

99A. Stanford Introductory Seminar: The Downside of Computing Systems—Preference to freshmen. Computers are critical components of our world in such tasks as surgery, air traffic control, and international banking. How computing systems fail, how such failures may affect our society in the future, and how to build and maintain systems to avoid failures. Case studies of computer-related disasters, including the Therac-25 accidents, the Internet worm, and the Ariane 5 crash. Topics: computer security, robust distributed systems, fault-tolerant architectures, organizational behavior.
3 units (Baker) not given 2000-01

99C. Stanford Introductory Seminar: Computers—Fact and Fiction—Preference to freshmen. Can a computer be world chess champion? How can it learn to do something it wasn't told to do? Can it create? Even computer scientists have disagreed. Some interesting and/or controversial predictions are compared to the state of the art technology. Things computers have already done, things that they might be able to do, and things that computers cannot do. Possible topics: virtual reality, the world wide web, machine learning, computer game playing, security and cryptography, etc. Prerequisite: basic understanding of how computers work (i.e., how we write programs that tell a computer what to do).
3 units (Koller) not given 2000-01

99D. Stanford Introductory Seminar: The Science of Art—Preference to freshmen. The interwoven histories of science and Western art from the Renaissance to the 19th century. Emphasis is on the revolutions in science and mathematics that have inspired parallel revolutions in the visual arts (e.g., Brunelleschi's invention of linear perspective, Newton's discoveries in geometric optics, and the theories of color vision proposed by Goethe, Young, Helmholtz, etc.). The scientific principles behind computer graphics). GER: 2b (DR: 6)
3 units, Win (Levy)

99E. Stanford Introductory Seminar: Great Ideas in Computer Science—Preference to freshmen. The power and limitations of computers; concrete strategies for solving problems using computers. What can a computer do efficiently? Why are programs hard to test? How can we make computers appear clairvoyant? How do you keep secrets in computers? Should tables be sorted? When is it a good idea to be greedy? These questions involve ideas whose impact ranges from the philosophical foundations of computation to concrete applications in everyday life. Prerequisite: mathematical maturity (e.g., AP Math) and exposure to computer programming.
3 units (Motwani, Raghavan) not given 2000-01

99F. Stanford Introductory Seminar: Paradox—Bug or Feature?—Preference to freshmen. Conflict in thought is as inevitable as in territory

3 units, Win (Pratt)

99G. Stanford Introductory Seminar: The Two Cultures—Bridging the Gap—Preference to freshmen. In 1959, the British physicist and novelist C. P. Snow delivered a lecture at Cambridge University in which he argued that "the intellectual life of the whole of western society is increasingly being split into two polar groups." In Snow's view, these groups, which can be characterized roughly as humanists and scientists, exist as separate cultures that have "almost ceased to communicate at all." Professors in Computer Science and English collaborate to examine the nature of this split, reflected at Stanford by the tendency to divide the campus community into "techies" and "fuzzies," and explore ways to bridge this cultural gap.

3 units, Aut (Roberts, Saldivar)

99H. Stanford Introductory Seminar: Programming and Problem Solving Seminar—Preference to freshmen. Students are given five problems to solve. Each involves programming, but programming is not sufficient to solve the problem (i.e., the approach to the problem is at least important). Students experiment individually and as a group with techniques, and write a working program as a solution. Group discussions include general problem-solving approaches and concepts relevant to the problem at hand. Prerequisite: 106B or 106X.

3 units (Ullman) not given 2000-01

99I. Stanford Introductory Seminar: Business on the Information Highways—Preference to freshmen. Understanding the capabilities of the Internet and its services. The effect on commerce, education, and healthcare. Technical and business alternatives. Who will be hurt and who will benefit from the changes occurring? The central project develops sections of a Web publication.

3 units, Win (Wiederhold)

99J. Stanford Introductory Seminar: Computer Security in the Electronic Age—Preference to sophomores. Based on readings and discussions of current issues in computer security. Topics: the history of codes and ciphers and a summary of basic mathematics used in current cryptography; causes of computer vulnerabilities, including program errors, design flaws, and inherent network and browser limitations; policies and practices that restrict or monitor access to information.

3 units (Mitchell) not given 2000-01

99K. Stanford Introductory Seminar: Digital Actors—Preference to sophomores. Digital actors are an emerging field, with applications to video games, movies, simulation and training, manufacturing, and animated web pages. Introduces the computational techniques used to create and animate robotics, geometric computing, computer vision, and graphics. The problem of creating/animating digital actors, technical subproblems. Prerequisite: knowledge of elementary geometry. Recommended: some programming experience.

3 units (Latombe) not given 2000-01

3 units (Boneh) not given 2000-01

99N. Stanford Introductory Seminar: Ruler, Compass, and Computer-Computational Representations of Geometry—Preference to sophomores. Representations of geometry play an important role in computer science in the physical world. Models of physical objects and processes as used in computer graphics, computer vision, and robotics use geometry as an essential component of representing shape, motion, and other physical modalities. The mathematical ideas behind commonly used representations and algorithms for geometric objects, focusing on intuitive understanding as opposed to formal development. Prerequisite: introductory CS class, e.g., 106A, B or X. Recommended: general background knowledge in mathematics and physics.

3 units, Spr (Guibas)

99P. Stanford Introductory Seminar: Smart Computers and other Technological Opportunities—Preference to freshmen. How smart are computers now? How smart can we make them, and how soon, and what good will they be? Of the current "smart" things, how smart are they and what genuine benefits are offered? Outside of computers, what are the technological opportunities for humanity? To what extent is humanity in difficulty with natural resources? What significant threats are there to humanity?

3 units (McCarty) not given 2000-01

99Q. Stanford Introductory Seminar: Universal Ideas in Computation—Preference to freshmen. Techniques and ideas that cut across computer science, emphasizing concepts that also show up extensively in non-computer systems. Examples: indirection (especially naming and translation); using the past to predict the future; using randomness to make robust decisions; the pervasiveness of "skew" in data (20% of the code consumes 80% of CPU cycles, 4% of fighter pilots account for 40% of all kills); and the universality of scheduling and concurrency control, which are used to coordinate access to shared resources such as shared memory, intersections, classrooms, bathroom stalls, etc.

3 units, Spr (Engler)

103A. Discrete Mathematics for Computer Science—The fundamental mathematical foundations required for computer science. Topics: logic, relations, functions, basic set theory, proof techniques, combinatorics, recursion, and recurrence relations. GER:2c (DR:4)

3 units, Aut, Win (Johnson)

103B. Discrete Structures—Continuation of 103A. Topics: analysis of algorithms, mathematical formulations of basic data models (linear models, trees, graphs, and sets), regular expressions, grammers. Corequisite: 106B or 106X.

3 units, Win, Spr (Johnson)

103X. Discrete Structures (Accelerated)—Covers the material in 103A and B in a single quarter. Students who take 103X feel comfortable with mathematical formalism. GER:2c (DR:4)

3 units, Win (Dill, Mitchell)

* May be taken for 3 units by graduate students.

105. Introduction to Computers—For non-technical majors. What computers are and how they work. Practical experience in programming. Construction of computer programs and basic design techniques. A survey of Internet technology and the basics of computer hardware. Students in technical fields and students looking to acquire programming...
understand the concepts presented in 106A, usually in a language other
than C. First three weeks focus on understanding how the concepts are
expressed in ANSI C. GER:2b (DR:6)

106B. Programming Abstractions—Abstraction and its relation to
programming. The software engineering principles of data abstraction,
modules, certain fundamental data structures (e.g., stacks and queues),
and data-directed design. Recursion and recursive data structures (linked
lists and binary trees). Brief introduction to time and space complexity
analysis. Prerequisite: 106A or consent of the instructor, based on prior
exposure to ANSI C. GER:2b (DR:6)

106X. Programming Methodology and Abstractions (Accelerat-
ed)—Covers most of the material in 106A,B. Students are expected to
have previous programming experience at a level that allows them to
understand the concepts presented in 106A, usually in a language other
than C. First three weeks focus on understanding how the concepts are
expressed in ANSI C. 106B material is covered for the balance. Students
who complete 106A should enroll in 106B. 106X can be taken after 106A
only with consent of instructor. GER:2b (DR:6)

107. Programming Paradigms—Intense introduction to a variety of
programming paradigms, programming languages, and language imple-
mentations. Topics: the compile-time languages, using advanced mem-
ory management features of imperative and multithreaded C; the func-
tional paradigm, using LISP (or possibly ML); the object-oriented
paradigm, using Java (and possibly Python); and the generic program-
ning paradigm, introducing C++ and templates. Substantial program-
ming projects. Prerequisite: 106B, 106X, or equivalent.

108. Object-Oriented Systems Design—Software design and con-
struction in the context of large OOP libraries. May be taught in C++
or Java. Topics: review of OOP, the structure of Graphical User Interface
(GUI) OOP libraries, GUI application design and construction, OOP
software engineering strategies, approaches to programming in teams.
Prerequisite: 107.

110. Introduction to Computer Systems and Assembly Language
Programming—Organization of digital computers, buses, registers,
processors, I/O, memory systems, and paging memory. Data representa-
tion, data structures, and computer arithmetic. Instruction sets and
execution; addressing modes. Assembly language programming, includ-
ing subroutines, co-routines, interrupts, and traps. Operating systems
issues and principles of storage management; combines general princi-
ples and practice in implementations. Prerequisite: 106B or 106X.

112. Computer Organization and Design—(Enroll in Electrical Engi-
neering 182.)

121. Artificial Intelligence—(Only one of 121/221 counts towards CS
degree requirements.) Introduction to the key concepts, representations,
and techniques used in building practical computational systems ("agents")
that appear to display artificial intelligence (AI), through the use of
sophisticated adaptive information processing algorithms. Topics: histo-
ry of AI, reactive systems, heuristic search, planning, constraint satisfac-
tion, knowledge representation and uncertain reasoning, machine learn-
ing, classification, applications to language, and vision. Prerequisites:
103B or 103X and basic facility with differential calculus, vector
algebra, and probability theory.

137. Introduction to Scientific Computing—The fundamental issues
of numerical computation for the mathematical, computational, and
physical sciences, and engineering. Emphasis is from the perspective of
the computer scientist. Use of numerical algorithms in engineering
practice. Problems of accurately computing solutions in the presence of
rounding errors and of computing discrete approximations of solutions
which are defined on the continuum. The taxonomy of problem classes
with methods for their solution and principles useful for analysis of
performance and algorithmic development. Topics: error analysis, the
solution of linear and nonlinear equations, interpolation and numerical
differentiation, the approximation of integrals, and the solution of
differential equations. Prerequisites: 106A; Mathematics 103 or 113 or
equivalents.

138. Matlab and Maple for Science and Engineering Applications—
Introduction to use of Matlab and Maple in engineering applications.
Emphasis is on the use of software to solve real problems. How the
algorithms work, primarily so user may understand their possible limi-
tations. How to use packages to solve a variety of introductory but
important problems in: linear systems, eigenvalue problems, ordinary
differential equations, elementary statistics, elementary signal process-
ing (Fourier transforms, wavelets), computer algebra, graphical interfac-
es. Applications for the engineering and physical sciences. Prerequisites:
undergraduate linear algebra and a willingness to program.

140. Operating Systems and Systems Programming—The funda-
mentals of operating systems design and implementation. Basic struc-
ture; synchronization and communication mechanisms; implementation
of processes, process management, scheduling, and protection; memory
organization and management, including virtual memory; I/O device
management, secondary storage, and file systems. Prerequisite: 108.
Recommended: Electrical Engineering 182.

143. Compilers—Principles and practices in the design of programming
language compilers. Topics: lexical analysis; parsing theory (LL, LR,
and LALR parsing); symbol tables; type checking; common representa-
tions for records, arrays, and pointers; runtime conventions for procedure
calls; storage allocation for variables; and generation of unoptimized
code. Students construct simple compiler as programming project.
Prerequisites: 103B or X, 107.

145. Introduction to Databases—Entity-relationship and relational
data models and approaches to database design. Relational and object-
relational query languages, with substantial coverage of SQL including
SQL3. Algebraic query languages and some database theory. Integrity
constraints, triggers, and views; functional dependencies and normal
forms. Object-oriented database design and query languages including
ODMG standard. Database transactions and security from the applica-
tion perspective. Designing a database for an application. Interactive and

* May be taken for 3 units by graduate students
programmatic interfaces to database systems. Introduction to advanced
topics, e.g., data warehouses, data mining, XML, and Web/database
interactions. Individual database application programming project with
extensive use of SQL. Prerequisites: 103B or X, 107.

147. Introduction to Human-Computer Interaction Design—Introduction
to the concepts underlying the design of human-computer
interaction: usability and affordances, direct manipulation, systematic
design methods, user conceptual models and interface metaphors, design
languages and genres, human cognitive and physical ergonomics, information
and interactivity structures, design tools and environments. Structured
around a set of case studies in which notable interface designs and/or projects are analyzed as illustrative of underlying principles.
Students participate in discussions of cases and do interface analysis and
design exercises.
3-4 units, Aut (Winograd)

148. Introductory Computer Graphics—(For undergraduates; M.S.
students or students with a strong interest in continuing in graphics
should take 248. Only one of 148 or 248 counts towards CS degree
requirements.) Introduction to two- and three-dimensional computer
graphics. Topics: fundamentals of input and display devices, scan
conversion of geometric primitives, two- and three-dimensional trans
formations and clipping, windowing techniques, curves and curved
surfaces, three-dimensional viewing and perspective, hidden surface
removal, illumination and color models, OpenGL, VRML, and 3-D
modeling tools. Emphasis is on the development of practical skills in
using graphics libraries and tools. Programming on Macintosh using C,
OpenGL, and VRML, with demos in SoftImage. Prerequisites: 107,
Mathematics 103.
3 units, Aut (Staff)

154. Introduction to Automata and Complexity Theory—Regular
sets: finite automata, regular expressions, equivalences among notations,
methods of proving a language not to be regular. Context free
languages: grammars, pushdown automata, normal forms for grammars,
proving languages non-context free. Turing machines: equivalent forms, undecidability. Nondeterministic Turing machines: properties, the class
NP, complete problems for NP, Cook's theorem, reducibilities among
problems. Prerequisite: 103B or X.
*4 units, Win (Staff)
Spr (Moitwani)

154N. Introduction to NP Completeness—Turing machines: equiva
lent forms, undecidability. Nondeterministic Turing machines: properties,
the class NP, complete problems for NP, Cook's theorem, reducabilities
among problems. Students participate in approximately the last half of 154.
Prerequisite: a knowledge of formal languages and automata as in
the first part of 154.
2 units, Win (Staff)
Spr (Moitwani)

156. Introduction to Verification and Concurrency—A taste of logic:
propositional, predicate, temporal. Specification and verification of
sequential programs: correctness and termination. Concurrent program
ming: communication and synchronization, principles and algorithms.
Specification of concurrent programs: safety and progress. Verification
of safety properties: invariants. Prerequisite: 103B or X.
3 units (Manna)

157. Logic and Automated Reasoning—Introduction to logic for
computer scientists. An elementary exposition from a computational
point of view, of propositional logic, predicate logic, axiomatic theories,
and theories with equality and induction. Interpretations, models, valid
ity, proof. Automated deduction: polarity, skolemization, unification,
resolution, equality. Strategies. Applications. Prerequisite: 103B or X.
*4 units, Aut (Manna)
Spr (Genesereth)

157L. Logic and Automated Reasoning Laboratory
1 unit

161. Design and Analysis of Algorithms—Efficient algorithms for
sorting, searching, and selection. Algorithm analysis: worst and average
case analysis. Recurrences and asymptotics. Data structures: balanced
trees, heaps, etc. Algorithm design techniques: divide-and-conquer,
dynamic programming, greedy algorithms, amortized analysis. Algo
rithms for fundamental graph problems, e.g., depth-first search, connect
ed components, topological sort, shortest paths. Possible topics: network
flow, string searching, parallel computation. Prerequisite: 103B or X;
Statistics 116.
*4 units, Aut (Plotkin)
Win (Staff)

162. Introduction to Combinatorics and its Applications—(Enroll in
Mathematics 108.)
3 units, Aut (Diaconis)

163. Symmetric Functions and Algebraic Combinatorics—(Enroll in
Mathematics 112.)
3 units, Win (Diaconis)

191. Senior Project—Restricted to Computer Science students. Group
or individual projects under faculty direction. Register using the section
number associated with the instructor.
1-6 units, any quarter (Staff)

191W. Writing Intensive Senior Project—Restricted to Computer
Science students. Group or individual projects under faculty direction.
Register using the section number of an Academic Council member.
(WIM)
1-6 units, any quarter (Staff)

192. Programming Service Project—Restricted to Computer Science
students. Appropriate academic credit (without financial support) is
given for volunteer computer programming work of public benefit and
educational value.
1-3 units, any quarter (Staff)

193D. C++ and Object-Oriented Programming—C++ programming
language and object-oriented programming paradigm. The major fea
tures of C++ 3.0 and the object design principles which apply generally
in Object Oriented Languages. Intensive programming assignments.
Prerequisites: knowledge of C and basic programming methodology as
developed in 106B or 106X.
3 units, Win (Cain)

193H. Human-Computer Interface Tools—Design-practitioner ori
ented survey of tools for building interactive interfaces, including
Director, Flash, and Basic Visual. Emphasis is on understanding interac
tion issues, exploiting tool capabilities, rapid prototyping, and extending
design skills. Prerequisites: programming fundamentals at the level of
106B or 106X.
3 units, Aut (Staff)

193I. Internet Technologies—Programmer-oriented survey of the au
thoring, distributing, and browsing technologies. The role, use, and
implementation of current Internet tools. Topics: TCP/IP; namespace,
connections, and protocols. Client/server structures. Web/HTTP/HTML
techniques for text, images, links, and forms. Server side programming,
CGI scripts. Security and privacy issues. Programming projects on
client- and server-side may be in Perl or Java. Languages are introduced
as needed. Emphasis is on understanding, exploiting, and extending
Internet technologies. Prerequisites: programming fundamentals at the

* May be taken for 3 units by graduate students
level of 106B or 106X, and the ability to build and debug programs in a Unix environment.

3 units, Win (Cain)

193J. Programming in Java—Hands-on experience to gain practical Java programming skills. Topics: object-oriented programming (classes, objects, messaging, inheritance), Java language features (interfaces, exceptions, packages, concurrency, garbage collection), use of the built-in packages (lang, util, io, networking, awt, swing), applets and servlets, security and verification, Java implementation and the virtual machine. Intensive programming assignments. Prerequisite: knowledge of C language and programming experience at the level of 106B, 106X.

3 units, Win (Cain)

193K. Advanced Java Applications—Tour of the advanced applications possible in Java. Possible topics: portable GUIs in Swing and distributed applications with RMI, and the various supporting technologies, e.g., concurrency, reflection, and serialization. Prerequisite: mastery of Java, e.g., 193J.

2 units, Spr (Parlante)

193L. Programming in LISP—Introduction to problem solving in the LISP language, focusing on the functional programming paradigm. Topics: recursion, list manipulation, mapping, functional arguments, destructive processing, macros, I/O, Lisp implementation, environments, packages, efficiency, object-oriented programming, classes, and methods. Term project. Prerequisite: 106B or 106X, or equivalent.

3 units (McCarthy)

193W. Microsoft Windows Programming—The fundamentals of programming on the Microsoft Windows platform, focusing on the use of Microsoft Foundation Class (MFC) framework. Other aspects of Windows programming including Microsoft’s COM and OLE object models. Requires a significant amount of programming. Prerequisite: knowledge of C++ at the level of 108 or 193D.

3 units, Win (Young)

194. Software Project—Student teams complete a significant programming project through the phases of design, specification, coding and testing under faculty supervision. Lectures on software engineering methodologies. Implementation; well-written proposal, specification, and software design document; demonstration of a prototype design and the final product. Prerequisite: 108. (WIM)

3 units, Win (Young)

195. Microcomputer Consulting—Overview of computer consulting, focusing on Macintosh and IBM-compatible systems. Topics: operating systems, networks, troubleshooting, and consulting methodology. Bi-weekly lectures emphasize on-campus computing environments. Students work as consultants in campus computer clusters and in residences. Prerequisite: 1C.

2 units, Aut, Spr (Staff)

196. Mainframe and Workstation Computer Consulting—Computer consulting in a workstation and server environment, focusing on the UNIX operating system under the SUN, HP, and SGI hardware systems. Topics: UNIX fundamentals, consulting tips, networking, and systems administration. Students work as on-duty consultants at the Sweet Hall and Terman computer clusters. Pre- or corequisite: 1U.

2 units, Win, Spr (Staff)

198. Teaching of Computer Science—Teach a small discussion section of 106A while learning the fundamentals of teaching a programming language at the introductory level. Two workshops/meeting weekly on introductory material in general, 106 specifically, and teaching techniques. Application and interview required; see the 198 coordinator in CS for information. Prerequisite: 106B or 106X.

4 units, Aut, Win, Spr (Roberts, Chong, Burgess)

199. Independent Work—Special study under faculty direction, usually leading to a written report. Letter grade given; if this is not appropriate, enroll in 199P. Register using the section number associated with the instructor.

any quarter (Staff)

199P. Independent Work—Like 199, but graded Satisfactory/No Credit.

any quarter (Staff)

UNDERGRADUATE AND GRADUATE

200. Undergraduate Colloquium—Strongly recommended for junior-year CS majors as a way to build contacts with faculty. Weekly presentations by faculty and people from industry informally describing their views of computer science as a field and their experience as computer scientists. (AU)

1 unit, Aut (Plummer)

201. Computers, Ethics, and Social Responsibility—Primarily for majors entering computer-related fields. Analysis of the ethical and social issues related to the development and use of computer technology. Introduction to the relevant background in ethical theory, and the social, political, and legal considerations. Analysis of scenarios in specific problem areas: privacy, reliability and risks of complex systems, and the responsibility of professionals for the applications and consequences of their work. Prerequisite: 106B or 106X. (WIM)

*4 units, Win (Roberts)

205. Mathematical Methods for Robotics and Vision—Overview of some of the mathematical background necessary for research in robotics and vision. Possible topics: geometric meaning of linear algebra concepts; Singular Value Decomposition; Schur Decomposition; differential equations; dynamic systems and stochastic estimation (Kalman filtering); vector and tensor calculus; calculus of variations. Prerequisites: 106B or 106X, Mathematics 51 and 113; or equivalents.

3 units, Aut (Tomasi)

206. Technical Foundations of Electronic Commerce—As the internet and wide-area networks are increasingly used to conduct commerce, computer scientists need to understand the nature of economic mechanisms, e.g., auctions, and devise the ways to implement them efficiently. Relevant economic theories. Lab to design and implement a substantial application in small groups. Prerequisites: sufficient mathematical maturity to follow basic combinatorial and probabilistic arguments, and ability to code in either C++ or Java.

3 units, Spr (Shoham, Boneh, Ullman)

211. Logic Design—(Enroll in Electrical Engineering 275.)

3 units, Aut, Win (McCluskey)

3 units, Aut, Win (Staff)

221. Artificial Intelligence: Principles and Techniques—(Only one of 121 or 221 counts towards CS degree requirements.) Broad technical introduction to core concepts and techniques in artificial intelligence. Topics: search, planning, constraint satisfaction. knowledge representation, probabilistic models, machine learning, neural networks, vision, robotics, and natural language understanding. Prerequisites: 103B or 106X, or 109 and 157, or Philosophy 160A and exposure to basic concepts in probability. Recommended: facility with basic differential calculus.

*4 units, Aut (Koller)

222. Knowledge Representation—Declarative knowledge representation methods in artificial intelligence. Topics: time and action, defaults, compositional modeling, object-oriented representation, inheritance,

* May be taken for 3 units by graduate students
ontologies, knowledge on the Web, knowledge servers, multiple views, qualitative modeling. Prerequisite: basic familiarity with logic. Recommended: prior exposure to artificial intelligence as in 121/221.

3 units, Win (Fikes)

223A. Introduction to Robotics—Topics: manipulator kinematics and inverse kinematics; manipulator dynamics, motion, and force control; motion planning and robot programming. Recommended: knowledge of matrix algebra.

3 units, Win (Khatib)

223B. Introduction to Computer Vision—Fundamental issues and techniques of computer vision. Image formation, edge detection and image segmentation. Limited enrollment. Prerequisite: 125A or equivalent.

3 units, Win (Tomasi)

224M. Multi-Agent Systems—Aimed at advanced undergraduate, master’s levels, and interested Ph.D. students. Various aspects of extending AI theories and techniques from the single-agent case to the multi-agent (MA) case. Topics: MA knowledge representation, planning, reasoning under uncertainty, learning, coordination mechanisms, and automated negotiation. Emphasis is on representation techniques and algorithms, the former drawn from logic, decision theory, and game theory. There are no programming assignments or textbooks on the topic. Limited enrollment. Prerequisites: knowledge of basic probability theory, first-order logic, and algorithms.

3 units, Win (Shoham)

224N. Natural Language Processing—(Enroll in Linguistics 237.) Limited enrollment. Prerequisites: Basic programming skills at the level of 106B, 106X, 205, or equivalent.

3 units, Spr (Manning)

225A. Experimental Robotics—Hands-on experience with robotic manipulation and navigation systems. Topics: kinematic and dynamic control of motion, compliant motion and force control, collision avoidance, motion planning, assembly planning, task specifications, and robot-human interfaces. Limited enrollment. Prerequisite: 223A.

3 units, Spr (Khatib)

225B. Robot Programming Laboratory—Hands-on introduction to the techniques of robot programming for robotics and non-robotics students. Series of guided exercises in which students program mobile robots to exhibit increasingly complex behavior (simple dead reckoning and reactivity, planning and map building, communication and cooperation). Topics: basics of motor control and sensor characteristics; sensor fusion, model construction, and robust estimation; control regimes (fuzzy control and potential fields); active perception; reactive planning architectures; various topics in sensor-based control, including vision-guided navigation. Student programmed robot contest. Programming is in C on Unix or Windows machines, done in teams. Prerequisites: Basic programming skills at the level of 106B, 106X, 205, or equivalent.

4 units, Aut (Konolige)

226. Knowledge-Based Systems and Applications—Knowledge-based (expert) system technology is the most widely-used application technology to emerge from AI. Topics: basics of KBs and ES; tech transfer from research to industry; knowledge engineering, KB programming, knowledge acquisition methodology; evolution of the technology as applied to business and government problems, current and future impact. Case studies, readings. System building project possible. Some guest lectures.

3 units, not given 2000-01

227. Reasoning Methods in AI—Technical presentation of algorithmic techniques for problem solving in AI. Combines formal algorithmic analysis with description of recent applications. Topics: propositional satisfiability, constraint satisfaction, planning and scheduling, diagnosis and repair. Focus is on recent results. Prerequisites: familiarity with the basic notions in data structures and design and with techniques in the design and analysis of algorithms. Recommended: previous or concurrent course in AI.

3 units, Spr (Nayak)

228. Probabilistic Models in Artificial Intelligence—Probabilistic modeling languages suitable for representing complex domains, algorithms for reasoning and decision making using these representations, and learning these representations from data. Focus is on graphical modeling languages such as Bayesian belief networks, extensions to temporal modeling using hidden Markov models and dynamic Bayesian networks, and extensions to decision making using influence diagrams and Markov decision processes. Recent applications to domains (speech recognition, medical diagnosis, data mining, statistical text modeling, and robot motion planning). Prerequisites: understanding of basic concepts in probability theory and in design and analysis.

3 units, Win (Koller)

229. Statistical Learning—Survey of major research areas in pattern recognition and statistical learning. Topics: foundations of statistical pattern recognition, parametric and non-parametric density estimation, linear and nonlinear classifiers, decision trees, Bayesian and neural networks, reinforcement learning, learning theory, and recent trends (e.g., boosting and support vector machines). Focus is on the underlying concepts and their application to various problems in vision, speech, language processing, animation, control, etc. Prerequisites: background in linear algebra, basic probability theory, and statistics; ability to write computer programs in one or more commonly used languages.

3 units, Win (Bregler)

237. Advanced Numerical Analysis—Three-quarter graduate sequence designed to acquaint students in mathematical and physical sciences and engineering with the fundamental theory of numerical analysis. Examples from applications.

237A. Numerical Linear Algebra—First in a three-quarter graduate sequence. Solution of systems of linear equations: direct methods, error analysis, structured matrices; iterative methods and least squares. Prerequisites: 106A, 137, Mathematics 103 or 113.

3 units, Win (Golub)

3 units, Spr (Staff)

3 units, Spr (Staff)

238. Parallel Methods in Numerical Analysis—Recent developments in parallel computer technology have made it necessary to reformulate numerical algorithms to exploit the full potential of this technology. Emphasis is on the different techniques for obtaining maximum parallelism in various numerical algorithms, especially those occurring when solving matrix problems and partial differential equations, and the subsequent mapping onto the computer. Implementation issues on parallel computers. Topics: parallel architecture, programming models, matrix computations, FFT, fast multiple methods, domain decomposition, graph partitioning. Prerequisite: 237A or Mechanical Engineering
200A, or consent of instructor. Recommended: familiarity with differential equations, and experience in advanced programming language such as F90, C, C++. 
3 units, Win (Staff)

240. Advanced Topics in Operating Systems—Advanced study in OS topics and exposure to recent developments in OS research. Readings/lectures on classic and new papers. Topics: virtual memory management, synchronization and communication, file systems, protection and security, operating system extension techniques, fault tolerance, and the history and experience of systems programming. Prerequisite: 140 or equivalent. 
3 units, Win (Staff) 
Spr (Rosenblum)

241. Advanced Topics in Internet Technologies and Systems—Architecture, design, and implementation of Internet-scale software infrastructure (services and applications). Achieving scalability, high availability, and robustness through modular software structure and performance tradeoffs, including harvest vs. yield and consistency vs. availability. Cluster-based runtime systems for Internet workloads, implementation and deployment challenges, economics of deploying and operating a service. Extending Internet services to mobile and post-PC era. 
3 units, Win (Fox)

242. Programming Languages—The basic elements of programming languages and programming paradigms: functional, imperative, and object-oriented. Introduction to formal semantic methods. Modern type systems, higher-order functions and closure, exceptions and continuations. Runtime support for different language features. Emphasis on separating the different elements of programming languages and styles. First half uses Lisp and ML to illustrate concepts; second half a selection of object-oriented languages. Prerequisite: 107, or experience with Lisp, C and some object-oriented language. 
3 units, Aut (Mitchell)

243. Advanced Compiling Techniques—The theoretical and practical aspects of building modern compilers. Topics: intermediate representations, basic blocks and flow-graphs, dataflow analysis, register allocation, global code optimizations, and interprocedural analysis. Prerequisite: 143 or equivalent. 
*4 units, Win (Lam)

244A. Introduction to Computer Networks—The principles and practice of computer networking, with emphasis on the Internet. The structure and components of computer networks, packet switching, layered architectures, TCP/IP, physical layer, error control, window flow control, local area networks (Ethernet, Token Ring; FDDI), network layer, congestion control, quality of service, multicast. Students enrolling in 244A Winter Quarter must have completed 140, or equivalent. 
*4 units, Aut (Tobagi) (enroll in Electrical Engineering 284) Win (McKeown)

244B. Distributed Systems—Distributed operating systems and applications issues, emphasizing high-level protocols and distributed state sharing as the key technologies. Topics: distributed shared memory, object-oriented distributed system design, distributed directory services, atomic transactions and time synchronization, file access, process scheduling, process migration and remote procedure call focusing on distribution, scale, robustness in the face of failure, and security. Prerequisites: 240, 244A. 
3 units, Spr (Staff)

244C. Distributed Systems Project—Companion project option for students taking 244B. Corequisite: 244B. 
3-6 units, Spr (Staff)

3 units, Win (Garcia-Molina)

247A. Human-Computer Interaction: Interaction Design Studio—Intended as preparation for project-based courses, e.g., 377 and 447/Mechanical Engineering 293. Systematic presentation and experience with the methods used in interaction design, including needs analysis, user observation, idea sketching, concept generation, scenario-building, storyboards, user character stereotypes, usability analysis, and market strategies. Prerequisite: 147 or Mechanical Engineering 101. 
3-4 units, Aut, Win, Spr (Staff)

247B. Contextual and Organizational Issues in Human-Computer Interaction—Enroll in Management Science and Engineering 430.) 
3-4 units, Spr (Hinds)

248. Introduction to Computer Graphics—(Only one of 148 or 248 counts towards CS degree requirements.) The fundamentals of input, display, and hardcopy devices, scan conversion of geometric primitives, 2D and 3D geometric transformations, clipping and windowing, scene modeling and animation, algorithms for visible surface determination, introduction to local and global shading models, color, and photorealistic image synthesis. Written assignments and programming projects. Prerequisites: 107, Mathematics 103 or equivalent. 
*5 units, Aut (Levoy)

248V. Introduction to Scientific Visualization—Alternative introduction to computer graphics, emphasizing techniques for visualizing multidimensional data, especially continuous functions of two and three dimensions. Topics: the graphics pipeline, visualization of scalar, vector, and tensor fields, volume rendering, isosurface extraction, display of level sets and polygon meshes, and programming toolkits and interactive systems for data visualization; the design of visual metaphors for medical imaging, fluid flow, geophysics, meteorology, and other applications. Written assignments and programming projects. Not a substitute for 248 as a prerequisite for upper-level graphics courses. Prerequisites: basic calculus, linear algebra, and ability to program in C or C++. 
*4 units, Spr (Fedkiw, Levoy)

249. Object-Oriented Programming from a Modeling and Simulation Perspective—Object-oriented programming techniques and issues, emphasizing programming as modeling and simulation. Topics: large-scale software development approaches, encapsulation, use of inheritance and dynamic dispatch, design of interfaces and interface/implementation separation, exception handling, design patterns, minimizing dependencies and value-oriented programming. The role of programming conventions/style/restrictions in surviving object-oriented programming for class libraries, frameworks, and programming-in-the-large; general techniques for object-oriented programming. Prerequisites: knowledge of C and basic programming methodology as developed in 106B or 106X, 107, basic knowledge of C++ (may be taken concurrently). Recommended: 193D. 
3-5 units, Win (Staff)

255. Introduction to Cryptography and Computer Security—Intended for advanced undergraduates and graduate students. Introduction to the basic theory and practice of cryptographic techniques used in computer security. Topics: encryption (single and double-key), digital signatures, pseudo-random bit generation, authentication, electronic commerce (anonymous cash, micropayments), key management, zero-
knowledge protocols. Prerequisite: basic understanding of probability theory.

3 units, Win (Boneh)

3 units, Win (Manna)

256L. Formal Methods for Concurrent and Reactive Systems Laboratory
2 units, Win (Manna)

257. Automated Deduction and its Applications—Proving theorems and extracting information from proofs. Uses in software engineering (program specification, synthesis, and verification) and artificial intelligence (commonsense and robotic planning, natural-language understanding). The foundations of logic programming. Deductive tableaux, nonclausal resolution, skolemization, building theories into unification and inference rules, term rewriting, inductive theorem proving. The design of theorem provers. Prerequisite: 157.

3 units (Staff)

258. Introduction to Programming Language Theory—Syntactic, operational, and semantic issues in the mathematical analysis of programming languages. Type systems and non-context-free syntax. Universal algebra and algebraic data types. Operational semantics given by rewrite rules; confluence and termination. Scott-semantics for languages with higher-type functions and recursion. Treatment of side-effects. Prerequisites: 154, 157 or Philosophy 160A.

3 units, Win (Mitchell)

260. Concrete Mathematics—Mathematics for the analysis of algorithms: recurrences, summations, generating functions, asymptotics. Elementary combinatorics, discrete probability, and number theory. Prerequisites: 103B or 103X, Mathematics 42, or equivalent.

3 units, Win (Manna)

3 units, Win (Plotkin)

270A. Introduction to Medical Informatics: Fundamentals Methods—(Same as Biomedical Informatics 210A.) Issues in the modeling, design, and implementation of computational systems for use in biomedicine. Topics: controlled terminologies in medicine and biological science, ontologies, fundamental algorithms, basic knowledge representation, information dissemination and retrieval. Emphasis is on the principles of modeling data and knowledge in biomedicine and on the translation of resulting models into useful automated systems.

3 units, Aut (Musem, Altman)

270B. Introduction to Medical Informatics: Systems and Requirements—(Same as Biomedical Informatics 210B.) Survey of the major application areas in medical informatics, including clinical information systems, imaging systems, bioinformatics, public policy, decision support, and signal processing. Emphasis is on the system requirements, relevant data, algorithms, and implementation issues in each area. Prerequisite: 270A.

3 units, Win (Shahar, Dev)

271. Decision-Making Methods for Biomedicine—For undergraduates or graduate students, building on concepts introduced in 270B. Intermediate biomedical decision making and survey of the methods for the implementation of such concepts in computer-based decision-support tools. Emphasis is on Bayesian statistics, decision analysis, cost-benefit analysis, neural networks, artificial intelligence/expert systems, belief networks, influence diagrams, and the synergies among such approaches. Prerequisites: 270B and at least one programming course.

3 units (Higgins, Garber, Owens, Sanders) not given 2000-01

272. Medical Informatics Project Course—(Same as Biomedical Informatics 212.) For students who have completed 270A, 270B, 271 or 274, and who wish to implement those ideas in a computer program. Students may take 274 concurrently and complete a project that is coordinated between the two courses. Prerequisites: programming experience, 270B.

3 units, Sum (Altman, Koza)

274. Representations and Algorithms for Computational Molecular Biology—(Same as Biomedical Informatics 214.) Introduction to basic computational issues and methods used in bioinformatics, including access and use of biological data sources on the Internet. Topics: basic algorithms for alignment of biological sequences and structures, computing with strings, phylogenetic tree construction, hidden Markov models, computing with networks of genes, basic structural computations on proteins, protein structure prediction, protein threading techniques, homology modeling, molecular dynamics and energy minimization, statistical analysis of 3D biological data, integration of diverse data sources, knowledge representation and controlled terminologies for molecular biology, graphical display of biological data, genetic algorithms and genetic programming applied to biological problems. See instructor for unit options. Prerequisites: programming skills and understanding of matrix algebra.

1-4 units, Spr (Altman, Koza)

275A. Musical Information: An Introduction—(Enroll in Music 253.)
1-4 units, Win (Selfridge-Field)

275B. Seminar: Musical Representation and Computer Analysis—(Enroll in Music 254.)
1-4 units, Spr (Selfridge-Field)

298. Seminar on Teaching Introductory Computer Science—Opportunity for faculty and undergraduate and graduate students who are interested in teaching to discuss specific topics raised by teaching computer science at the introductory level. Prerequisite: consent of instructor.

1-3 units, Aut, Win, Spr (Roberts)

PRIMARILY FOR GRADUATE STUDENTS

300. Departmental Lecture Series—For first-year Computer Science Ph.D. students. Presentations by members of the department faculty, each describing informally his or her current research interests and views of computer science as a whole. (AU)
1 unit, Aut (Staff)

309. Industrial Lectureships in Computer Science—The department invites an outstanding computer scientist to give a course in his/her specialty. Lecturers and topics change yearly; courses may be taken repeatedly. See Time Schedule for offerings.

3 units

312. Processor Design—(Enroll in Electrical Engineering 382.)
3 units (Staff) given 2001-02

3 units (Staff) not given 2000-01

315B. Parallel Programming Project—Continuation of 315A. A significant parallel programming project is required using shared-memory, message-passing, or data-parallel machines. Lectures on parallel programming languages and their implementation, performance debugging of parallel programs, parallel data structures and algorithms. Prerequisite: 315A or consent of instructor.

3 units (Staff)

316A. Logic Synthesis of VLSI Circuits—(Enroll in Electrical Engineering 318.)

3 units, Win (DeMicheli)

316B. Computer-Aided System Design Laboratory—(Enroll in Electrical Engineering 319.)

3 units, Spr (DeMicheli)

3 units, (Staff) alternate years, given 2001-02

318. Testing Aspects of Computer Systems—(Enroll in Electrical Engineering 488.)

3 units, alternate years, given 2001-02

319. Topics in Digital Systems—Advanced material is often taught for the first time as a "topics" course, perhaps by a faculty member visiting from another institution. Students may therefore enroll repeatedly in a course with this number. See Time Schedule for topics currently being offered.

by arrangement

323. Common Sense Reasoning in Logic—Formalizing common sense knowledge and reasoning using situation calculus with nonmonotonic logics, especially circumscription. Variations of situation calculus. Formalizing context. Formalizing facts about knowledge. Prerequisite: basic knowledge of logic such as 157, or Philosophy 160A.

3 units, Aut (McCarthy)

326A. Motion Planning—For students interested in computer graphics, geometrical computing, robotics, and/or artificial intelligence. Computing object motions is central to many application domains (e.g., design, manufacturing, robotics, animated graphics, medical surgery, drug design). Basic path planning methods generate collision-free paths among static obstacles. Extensions include uncertainty, mobile obstacles, manipulating movable objects, and maneuvering with kinematic constraints. Configuration space is a unifying concept, geometric arrangements are a basic combinatorial structure. Theoretical methods with applications in various domains: assembly planning, radiosurgery, graphic animation of human figures.

3 units (Latombe) not given 2000-01

327A. Advanced Robotic Manipulation—Topics: redundant manipulators, robot motion/force control; kinematic singularities; inertial properties, dynamic performance, and robot design; macro/micro manipulator systems; mobile manipulator platforms; cooperative robots; sensor-based primitives, artificial potential field and force strategies. Prerequisites: 223A, consent of instructor.

3 units, Spr (Khatib)

328. Topics in Computer Vision—Fundamental issues of, and mathematical models for, computer vision. Sample topics: camera calibration, texture, stereo, motion, shape representation, image retrieval, experimental techniques. Student papers and project. Prerequisites: 205, 223B, or equivalents.

3 units, Apr (Tomasi) alternate years, not given 2001-02

329. Topics in Artificial Intelligence—Advanced material is often taught for the first time as a "topics" course, perhaps by a faculty member visiting from another institution. Students may therefore enroll repeatedly in a course with this number.

1-3 units

3 units (Golub)

337. Numerical Methods for Initial Boundary Value Problems—Initial boundary value problems are solved in different areas of engineering and science modeling phenomena, e.g., wave propagation and vibration, fluid flow, etc. Numerical techniques for such simulations are discussed in the context of applications. Emphasis is on stability and convergence theory for methods for hyperbolic and parabolic initial boundary value problems, and the development of efficient methods for these problems.

3 units, Spr (Staff)

339. Topics in Numerical Analysis—Advanced material is often taught for the first time as a "topics" course, perhaps by a faculty member visiting from another institution. Students may therefore enroll repeatedly in a course with this number. See Time Schedule for current topics.

2-3 units, Aut (Van Huffel) alternate years, not given 2001-02

Win (Golub)

341. Advanced Topics in Data Communication—Readings/discussion are combined with topical lectures to familiarize students with a core of classic and new papers in the field of data networking. Emphasis is on understanding and applying existing work to new problems in the field, especially high-speed networking. Topics: network theory (the end-to-end argument), transport protocol performance (header prediction, checksum efficiency), cell relay (e.g., ATM and SONET), congestion control (Parekh's thesis, leaky bucket, fair queueing) and high-speed switching (input vs. output queueing, crossbars and banyans). Prerequisite: 244A.

3 units (Partridge)

342. Programming Language Design—Problems of programming language design and comparison of traditional solutions. Possible topics: formal semantics, implementation considerations, extensibility, very high level languages, evaluation of language designs, the innovative features of a variety of modern programming languages. Prerequisites: 242, 243.

3 units (Mitchell)

343. Topics in Compilers—Advanced topics in compilers. Topics change every quarter; course may be taken repeatedly for credit. Prerequisite: 243.

3 units, Spr (Lam)

344. Projects in Computer Networks—For students with a strong interest in computer networks from novel applications to physical layer coding schemes; software to hardware; theory to design-and-build. Teams of two or more complete a small research project of sufficient quality and interest to merit presentation at a conference, or to form the basis of a new business, e.g., studies of network traces, network traffic visualization tools, home-networking, analysis of performance of cable-modems, novel web applications, or novel router architecture. Enrollment limited to 20. Prerequisites: 244A; or Electrical Engineering 284
346. Database System Implementation—A major database system implementation project realizes the principles and techniques covered in earlier courses. Students independently build a complete database management system, from file structures through query processing, with a personally designed feature or extension. Lectures on project details and advanced techniques in database system implementation, focusing on query processing and optimization. Guest speakers from industry on commercial DBMS implementation techniques. Prerequisites: 145, 245. Recommended: programming experience in C++.

3 units, Spr (Staff)

347. Transaction Processing and Distributed Databases—The principles and system organization of distributed databases. Data fragmentation and distribution, distributed database design, query processing and optimization, distributed concurrency control, reliability and commit protocols, and replicated data management. Distributed algorithms for data management: clocks, deadlock detection, and mutual exclusion. Heterogeneous and federated distributed database systems. Overview of commercial systems and research prototypes. Prerequisites: 145, 245.

*4 units, Win (Guibas)

*4 units, Win (Guibas)

348B. Computer Graphics: Image Synthesis Techniques—Intermediate level, emphasizing the sampling, shading, and display aspects of computer graphics. Topics: local and global illumination methods including radiosity and distributed ray tracing, texture generation and rendering, volume rendering, strategies for anti-aliasing and photorealism, human vision and color science as they relate to computer displays, and high-performance architectures for graphics. Written assignments and programming projects. Prerequisite: 248 or equivalent. Recommended: exposure to Fourier analysis or digital signal processing.

*4 units, Spr (Hanhrahan)

348C. Computer Graphics: Animation Techniques—Overview of computer animation techniques. Topics: traditional principles of animation, physical simulation, procedural methods, and motion capture based animation. Focus is on computer science aspects of animation. The basics, e.g., kinematic and dynamic modeling techniques to exploration of current research topics such as motion re-targeting, learning movements and behaviors, and video based modeling and animation. Hands-on animation experience through class projects.

3 units, SPR (Bregler)

1-3 units (Heeger) alternate years, given 2001-02

* May be taken for 3 units by graduate students.

349. Topics in Programming Systems—Advanced material often taught for the first time as a "topics" course, perhaps by a faculty member visiting from another institution. Students may enroll repeatedly in a course with this number. See Time Schedule for topics currently being offered.

3 units, Spr (Prabhakar)

351. Topics in Complexity Theory and Lower Bounds—Focus is on one of: basic machine models and complexity measures—their properties and relationships, complexity classes and their properties, reductions and complete problems, concrete representative problems from important complexity classes. Techniques for establishing limits on the possible efficiency of algorithms, and concrete lower bounds based on the following models of computation: decision trees, straight line programs, communication games, branching programs, PRAMs, boolean circuits. Approximation algorithms and the complexity of approximations. Pseudo-randomness and cryptography. Prerequisite: 154, or equivalent.

3 units (Motwani) alternate years, given 2001-02

3 units, Aut (Widom)

3 units, Aut (Pratt)

354. Probabilistic Reasoning in Computing—The basics of (Bayesian) probability theory as applied to computing and intelligence systems. Emphasis is on working through applications and understanding relevant theory. Relevant probability theory and techniques: interpretations, graphical and network models, information theory, decision theory, inference, and "alternative" approaches. Probabilistic aspects of computational problems in learning, search, data analysis, neural, and dynamic systems. Some topics by guest lecturers. Prerequisites: 106B or 106X, 221, a knowledge of basic statistical measures as in Psychology 60, and basic math.

3 units (Staff)

355. Advanced Topics in Cryptography—For graduate students. Topics: pseudo-random generation, zero knowledge protocols, elliptic curve systems, threshold cryptography, security analysis using random oracles, lower and upper bounds on factoring and discrete log. Prerequisite: 255.

3 units, Spr (Boneh)

356. Automatic Formal Verification Techniques—Automatic methods for formally verifying hardware, protocol, and software system designs. Topics: state graph and automata models of system behavior. Automata on infinite strings. Linear and branching-time temporal logic. Model-checking. Modeling real-time systems. Analysis methods based on Boolean formulas, and other ways of coping with the "state explosion problem." Exploiting abstractions. Applications to circuits, algorithms,
and protocols. Case studies use a variety of verification tools. Prerequisites: 154 or 254. Recommended: good understanding of basic automata and complexity theory, and undergraduate-level background in computer science.

3 units (Dill) alternate years, given 2001-02

3-5 units, Spr (Manna, Sipma)

358. Topics in Programming Language Theory—Possible topics of current research interest in the mathematical analysis of programming languages: structured operational semantics, domain theory, semantics of concurrency, rich type disciplines, problems of representation independence, and full abstraction. May be repeated for credit. Prerequisites: 154, 157, 258, or equivalents.

3 units (Mitchell)

359. Topics in Theory of Computation—Advanced material is often taught for the first time as a “topics” course, perhaps by a faculty member visiting from another institution. Students may therefore enroll repeatedly in a course with this number. See Time Schedule for topics currently being offered.

361A. Advanced Algorithms—Advanced data structures: union-find, self-adjusting data structures and amortized analysis, dynamic trees, Fibonacci heaps, universal hash function and sparse hash tables, persistent data structures. Advanced combinatorial algorithms: algebraic (matrix and polynomial) algorithms, number theoretic algorithms, group theoretic algorithms and graph isomorphism, on-line algorithms and competitive analysis, strings and pattern matching, heuristic and probabilistic analysis (TSP, satisfiability, cliques, colorings), local search algorithms. Prerequisite: 161 or 261, or equivalents.

3 units (Motwani) alternate years, given 2001-02

3 units, Spr (Plotkin) alternate years, not given 2001-02

365. Randomized Algorithms—Design and analysis of algorithms that use randomness to guide their computations. Basic tools, from probabilistic theory and probabilistic analysis, that are recurrent in algorithmic applications. Randomized complexity theory and game-theoretic techniques. Algebraic techniques. Probability amplification and derandomization. Applications: sorting and searching, data structures, combinatorial optimization and graph algorithms, geometric algorithms and linear programming, approximation and counting problems, parallel and distributed algorithms, on-line algorithms, number-theoretic algorithms.

Prerequisites: 161 or 261, Statistics 116, or equivalents.

3 units (Motwani) alternate years, not given 2001-02

367A. Parallel Computation—Introduction to theoretical issues in parallel computation. Properties of parallel computation models and algorithm design techniques specific to each model, including systolic arrays, mesh-connected computers, hypercube-related networks, and PRAM. Topics: algorithms for sorting, connected components, shortest paths, and other basic problems. Upper and lower bounds for randomized and deterministic routing on hypercube and related networks. Techniques for reducing the processor-time product for PRAM algorithms.

3 units (Plotkin)

3 units (Plotkin)

368. Geometric Algorithms—Graduate-level introduction to the basic techniques used in the design and analysis of efficient geometric algorithms including: convexity, triangulation, sweeping, partitioning, and point location. Voronoi and Delaunay diagrams. Intersection and visibility problems. Recent developments using random sampling methods. Emphasizes data structures of general usefulness in geometric computing and the conceptual primitives appropriate for manipulating them. Impact of numerical issues in geometric computation. Applications to motion planning, visibility preprocessing, model-based recognition, and GIS. Prerequisite: 161.

3 units, Spr (Guibas)

369. Topics in Analysis of Algorithms—Advanced material is often taught for the first time as a “topics” course, perhaps by a faculty member visiting from another institution. Students may therefore enroll repeatedly in a course with this number. See Time Schedule for topics currently being offered.

3 units

377. Topics in Human-Computer Interaction—Topics of current research interest in human-computer interaction. Contents change each quarter. May be repeated for credit.

3-4 units, Aut, Win, Spr

3-4 units, Spr (Winograd)

379. Interdisciplinary Topics—Advanced material that relates computer science to other disciplines is often taught for the first time as a “topics” course, perhaps by a faculty member visiting from another institution. Students may therefore enroll repeatedly in a course with this number. See Time Schedule for topics being currently offered.

by arrangement

390A,B,C. Curricular Practical Training—Provides educational opportunities in high-technology research and development labs in the computing industry. Qualified computer science students engage in internship work and integrate that work into their academic program. Students register during the quarter they are employed and must complete a research report outlining their work activity, problems investigated, key results, and any follow-on projects they expect to perform. Meets the requirements for Curricular Practical Training for students on F-1 visas. 390 A, B and C may each be taken only once.

1 unit, any quarter (Motwani)

393. Computer Laboratory—For CS graduate students. A substantial computer program is designed and implemented; written report required.
394. Business Management for Computer Scientists and Electrical Engineers—Focus is on the functional areas necessary for making successful business decisions. Topics: corporate strategy, new product development, marketing, sales, distribution, customer service, and financial accounting. How to identify and analyze issues in each of these areas in a rapidly changing world. A framework and tool set is developed for formulating, evaluating, and recommending action from the general manager point of view and for communicating and defending ideas in a team environment. Enrollment limited to 60. See http://www-leland.stanford.edu/class/cs394/. Prerequisite: graduate student in Computer Science or Electrical Engineering.

3-4 units (Gibbons, Liddle) not given 2000-01

395. Independent Database Project—For graduate students in Computer Science. Use of database management or file systems for a substantial application or implementation of components of database management system. Written analysis and evaluation required. Register using the section number associated with the instructor. Prerequisite: consent of instructor.

any quarter (Staff)

399. Independent Project

1-9 units, any quarter (Staff)

399P. Independent Project—Graded satisfactory/no credit.

1-9 units, any quarter (Staff)

EXPERIMENTAL

409. Formal Software Development—Introduction to formal methods for software development and the automation of these methods. Focus is on the composition of large formal specifications, and the refinement of specifications into efficient code. The foundations for specification composition and refinement are provided by category-theoretic concepts, e.g., colimits and sheaves. Topics: application-specific domain theories, formal refinement specifications, representation and use of programming knowledge, software architectures, algorithm and data structure design, program optimization techniques, datatype refinement, code generation, and system support. Hands-on exercises with a working system.

3 units (Smith, Green) alternate years, given 2001-02

426. Genetic Algorithms and Genetic Programming—The genetic algorithm is a domain-independent algorithm for search, optimization, and machine learning patterned after Darwinian natural selection and naturally occurring genetic operators such as recombination; mutation; gene duplication, deletion, regulation; and embryonic development. Genetic programming is a domain-independent automatic programming technique that extends the genetic algorithm to the breeding of populations of computer programs capable of producing human-competitive results. Topics: introduction to genetic algorithms and genetic programming; the mathematical basis for genetic algorithms; implementation on parallel computers and field-programmable gate arrays; applications to problems of system identification, control, classification, analysis of genome and protein sequences; automatic synthesis of the design of topology, sizing, placement, and routing of analog electrical circuits; automatic synthesis of controllers; and automatic synthesis of other complex network structures.

3 units, Spr (Kosar)

444N. Mobile and Wireless Networks and Applications—How mobility affects networks, systems, and applications. Mobility of devices and end-users has behavioral implications at all layers of the traditional Internet protocol stack, from the MAC layer up through the application layer. Handling mobility efficiently requires more information sharing between network layers than is typically considered. Topics: how mobility affects the layers of the protocol stack; and how it affects different functional aspects of systems, including security, privacy, file systems, resource discovery, resource management (including energy usage), personal on-line identities, and other areas. Emerging applications enabled by mobility. "Traditional" wireless networks, in which an underlying infrastructure is assumed; ad hoc mobile wireless networks, in which nodes may come and go and must form their own network infrastructure on the fly. Student groups design and implement mobile applications and system features of their choosing using network technologies such as WaveLAN, Metricom’s Ricochet network, the Palm-7, and Bluetooth. Prerequisites: 240, 244A, 244B, or equivalents.

3 units (Baker) not given 2000-01

447. Interdisciplinary Interaction Design—(Same as Mechanical Engineering 293.) Small teams develop innovative technology prototypes that combine product and interaction design. Focus is on software and hardware interfaces, interaction, design aesthetics, and some underpinnings of successful design: a reflective, interactive design process, group dynamics of effective interdisciplinary teamwork, and working with users. Prerequisite: 247A.

3-4 units, Spr (Winograd, Kelley)

448. Topics in Computer Graphics—In-depth study of an active research topic in computer graphics. Topic changes each quarter, e.g., exotic input and display technologies, graphics architectures, topics in modeling shape and motion, experiments in digital television, interactive workplaces, introduction to hand-drawn cartoon animation. Readings from literature and a project. May be taken repeatedly for credit. Prerequisite: 248 or consent of instructor.

3 units, Aut (Bregler)

448A. Experiments in Motion Capture

3 units, Aut (Bregler)

448B. Motion Study: An Introduction to Animation, Cartoon Physics, and Funny Walks—Preference to CS students with a graphics or animation specialization, and Art students from the Digital Arts program. Hands-on animation, providing a foundation for future work in computer graphics, digital art, and animation. The techniques, tools, and methods used by traditional animators. Through lectures, hands-on exercises, motion analysis, and screenings, students learn a variety of animation techniques and gain a basic control of timing, spacing, weight, and expressive motion. At the end of quarter, students have a short reel of their work plus new insight into the art of animation.
468. Topics in Geometric Algorithms—Advanced seminar covering different topics related to geometric computing. Recent offerings: shape matching, proximity and nearest-neighbor problems, visibility and motion planning, and collision detection. Readings from the literature and a presentation or a project required. May be taken multiple times for credit. Prerequisite: 368, or consent of instructor.

448C. Interactive Workplaces

499. Advanced Reading and Research—For CS graduate students. Register using the section number associated with the instructor. Prerequisite: consent of instructor.

GRADUATE SEMINARS

510. Digital Systems Reliability Seminar—(Enroll in Electrical Engineering 385A.)
1-4 units, Aut, Win, Spr, Sum (McClusky)

523. Readings in Artificial Intelligence—Primarily for students planning to take the AI qualifying exam. A series of lectures and discussions on readings in all areas of artificial intelligence research. Prerequisite: 221.
3 units, Win (Staff)

525. Seminar on Knowledge Acquisition for Expert Systems—(Enroll in Biomedical Informatics 230.)
2 units, Spr (Musen) alternate years, not given 2001-02

528. Broad Area Colloquium for Artificial Intelligence, Geometry, Graphics, Robotics, and Vision—Weekly series of informal research talks on topics related to perceiving, modeling, manipulating, and displaying the physical world. The computational models and numerical methods underlying these topics. Brings together faculty and students in these five closely related areas. (AU)
1 unit, Aut, Win, Spr (Staff)

530. Applied Mathematics/Scientific Computing Seminar—(AU)
1 unit, Aut, Win, Spr (Staff)

1 unit, Aut, Win, Spr (Staff)

540. Seminar on Computer Systems—(Enroll in Electrical Engineering 380.)
1 unit, Aut, Win, Spr (Allison, Wharton)

545. Database Research Seminar—Presentations of current research and industrial innovation in information systems, sponsored by Infolab faculty. Topics: fundamental database technology, digital libraries, knowledge-based processing and advanced applications. Interaction with speakers. (AU)
1 unit, Aut, Spr (Wiederhold, Decker)

545I. Advanced Image Databases Seminar—Reading/demonstrations/analysis devoted to image and video databases as created by photographic, medical, and commercial sources. Emphasis is on combining image-derived and textual descriptors to retrieve on-line images. Issues: data structures and indexing schemes for real-time interaction, high-dimensional feature vectors for fast retrieval, metrics of closeness between query and stored vectors. Presentations by commercial and research image retrieval organizations illustrate the strengths and weaknesses of specific techniques. May be combined with a 395 project. (AU)
1 unit, Win (Firschein, Wiederhold)

547. Human-Computer Interaction Seminar—Weekly speakers on topics related to human-computer interaction design. (AU)
1 unit, Aut, Win, Spr (Winograd)

548. Distributed Systems Research Seminar—Recent research in distributed operating systems, computer communications, parallel machines, parallel programming, and distributed applications. Invited speakers from Stanford and elsewhere present topics and results of current interest. (AU)
1 unit, Spr (Staff)

559. Seminar on Mathematical Theory of Computation—Possible topics (vary each year): logic and its relation to computation, programming language analysis and design, specification and verification of software and hardware systems, theories of concurrency, approaches to static analysis and program state. Invited speakers present recent results and summaries of articles from the current literature. (AU)
1 unit, by arrangement (Mitchell)

579. Frontiers in Interdisciplinary Biosciences—Cross-listed in multiple departments in the schools of Humanities and Sciences, Engineering, and Medicine; students should enroll directly through their affiliated department, if at all possible. Introduction to cutting-edge research involving interdisciplinary approaches to bioscience and biotechnology; for specialists and non-specialists. Associated with Stanford's Clark Center for Interdisciplinary Bioscience, and held in conjunction with a seminar series meeting twice monthly during 2000-01. Leading investigators from Stanford and throughout the world speak on their research; students also meet separately to present and discuss the ever-changing subject matter, related literature, and future directions. Prerequisite: keen interest in all of science, with particular interest in life itself. Recommended: basic knowledge of biology, chemistry, and physics.
2 units, Aut, Win, Spr (S. Block)
Associate Professors: Nicholas Bambos, John T. Gill III, Gregory T. A. Kovacs, Marc S. Levoy, Bruce B. Lusignan, Dwight G. Nishimura, Oyekunle Olukotun, Jennifer Widom, Howard A. Zebker
Assistant Professors: Mary G. Baker, Dan Boneh, Dawson Engler, Andrea J. Goldsmith, Thomas H. Lee, Nicholas McKeown, Balaji Prabhakar, Olav Solgaard, Benjamin VanRoy, Shan X. Wang
Professors (Research): David M. Bloom, Antony Fraser-Smith, James F. Gibbons, Butrus T. Khuri-Yakub, Arogyswami J. Paulraj, Piero A. Pianetta, Calvin F. Quate

Curtesy Professors: Malcolm R. Beasley, David Cherten, David L. Dill, Gary Glover, Gene Golub, Monica S. Lam, John McCarthy, Norbert Felc, Vaughan R. Pratt, Jeffrey Ullman, Brian Wandell
Curtesy Associate Professors: Per Enge, Peter Fitzgerald, David Heeger, Sandy Napol, Mendel Rosenblum, Zhi-Xun Shen, Julius Smith, Daniel Spielman
Curtesy Assistant Professors: Stacey Bent, Armando Fox, Claire Tomlin
Curtesy Professor (Teaching): Gilbert Masters
Acting Assistant Professor: Glen Solomon

Lecturers: Dennis Allison, Richard Dasher, Dieter Scherer, Howard Swain, John Wharton
Consulting Professors: Carl Berglund, Elizabeth Cohen, Bruce Deal, Abbas Emami-Naeini, Timothy Groves, Sam Haddad, Kiyoo Itoh, Theodore Kamins, Masahiro Kawahata, Else Kooi, John Koza, Jason G. Krishnayya, David Leeson, Michael Marhic, Mark McCord, Dan Meabiourger, Roger D. Melen, Madhally Narasimha, Yoshio Nishi, Kurt Petersen, Richard Reis, Donald Scharfetter, S. Venkat Shastri, Arden Sher, James Spilker, Jr., David Stork, John Wakerly, Martin Walt, John Woods
Consulting Associate Professors: Judy Hoyt, Brian Marcus, Carol Blue Muller, Yi-Ching Pao, Nirmal Saxena, Noel Thompson
Consulting Assistant Professors: John Apostolopoulos, Ahmed Bahai, David Burns, Isaac Chuang, Santiago Fernandez-Gomez, Nam Maluf, Steven Minne, Mehrdad Moslehi, M. Allen Northrup, Eckehard Steinbach, David Su, Susie Wee
Visiting Professors: Jacob Abraham, Abdullah Atalar, Yeheskel Bar-Ness, Ming-Jer Chen, Stewart Gillmor, Byoung Yoon Kim
Visiting Associate Professors: Pao-Chi Chang, Jeong-A Lee, Jicheng Hu, Mustafa Karaman, Hari Kuchibhotla, Tokumo Ogunfunmi
Visiting Assistant Professors: Luca Benini, Marie-Laure Boucheret

UNDERGRADUATE PROGRAMS

The mission of the Undergraduate Program of the Department of Electrical Engineering is to augment the liberal education expected of all Stanford undergraduates and impart a basic understanding of electrical engineering built on a foundation of physical science, mathematics, computing, and technology.

Graduates of the undergraduate program are expected to possess knowledge of the fundamentals of electrical engineering and of at least one specialty area. The graduates are expected to have the basic experimental, design, and communication skills to be prepared for continued study at the graduate level or for entry level positions that require a basic knowledge of electrical engineering, science, and technology.

The educational objectives of the program are:

1. Technical Knowledge: provide a basic knowledge of electrical engineering principles along with the required supporting knowledge of computing, engineering fundamentals, mathematics, and science. The program must include depth in at least one specialty area, currently including Computer Hardware, Computer Software, Controls, Electronics, Fields and Waves, and Communication and Signal Processing.

2. Laboratory and Design Skills: develop the basic skills needed to perform and design experimental projects. Develop the ability to formulate problems and projects and to plan a process for solution, taking advantage of diverse technical knowledge and skills.

3. Communications Skills: develop the ability to organize and present information and to write and speak effective English.

4. Preparation for Further Study: provide sufficient breadth and depth for successful subsequent graduate study, post-graduate study, or lifelong learning programs.

5. Preparation for the Profession: provide an appreciation for the broad spectrum of issues arising in professional practice, including economics, ethics, leadership, professional organizations, safety, service, and teamwork.

To specialize in Electrical Engineering (EE), undergraduate students should follow the depth sequence given in the discussion of undergraduate programs in the “School of Engineering” section of this bulletin. Majors must receive at least a 2.0 grade point average (GPA) in courses taken for the EE depth requirement.

For information about an EE minor, see the “School of Engineering” section of this bulletin.

A Stanford undergraduate may work simultaneously toward the B.S. and M.S. degrees. See the “School of Engineering” coterminal section of this bulletin.

GRADUATE PROGRAMS

University regulations governing the M.S., Engineer, and Ph.D. degrees are described in the “Graduate Degrees” section of this bulletin.

The profession of electrical engineering demands a strong foundation in physical science and mathematics, a broad knowledge of engineering techniques, and an understanding of the relationship between technology and man. Curricula at Stanford are planned to offer the breadth of education and depth of training necessary for leadership in the profession. To engage in this profession with competence, four years of undergraduate study and at least one year of postgraduate study are recommended. For those who plan to work in highly technical development or fundamental research, additional graduate study is desirable.

A one-year program of graduate study in electrical engineering may lead to the degree of Master of Science. A two-year program, offering a wider selection of engineering coursework, more opportunity for study in the related fields of engineering, mathematics, and physics, and in particular, more independent work and individual guidance, may lead to the degree of Engineer.

The degree of Doctor of Philosophy is offered under the general regulations of the University. The doctoral program, requiring a minimum of three years (nine quarters) of graduate study, should be considered by those with the ability and desire to make a life work of research or teaching.

Application for Admission—Applications for admission with graduate standing in Electrical Engineering (EE) can be completed electronically at http://www.stanford.edu/dept/registrar/admissions/apply info.html#electronic, or a printed application may be obtained by writing to Graduate Admissions, the Registrar’s Office, Old Union, Stanford, CA 94305-3005 or by calling (650) 723-4291. Applications are submitted to and reviewed by the Department of Electrical Engineering, Graduate Admissions Office, 350 Serra Mall, Stanford University, Stanford, CA 94305-9505. Applications for full-time study are considered for the Autumn Quarter only. The application deadline is December 15.

Applicants who have not yet earned the equivalent of an M.S. degree should apply for admission to study first toward the master’s degree, indicating any intention of later working toward a more advanced degree. Admission for either the Engineer or Ph.D. degree is normally available only to students who have completed a master’s degree. In addition, candidacy to the Engineer or Ph.D. degree also requires that the department’s Committee on Graduate Admissions identify a tentative faculty research supervisor.

MASTER OF SCIENCE

Modern electrical engineering is a broad and diverse field, and graduate education in this department may satisfy a variety of objectives. Students with undergraduate degrees in physics, mathematics, or related sciences, as well as in various branches of engineering, are invited to apply for admission. They will ordinarily be able to complete the master’s degree in one calendar year. Students with undergraduate degrees in other fields may also be admitted for graduate study (see below).
Electrical Engineering at Stanford University

The master's degree program may provide advanced preparation for professional practice or for teaching on the junior college level, or it may serve as the first step in graduate work leading to the degree of Engineer or Ph.D. The faculty does not prescribe specific courses to be taken. Each student, with the help of a program adviser, prepares an individual program and submits it to the faculty for approval. The master's program proposal must be submitted to the department office during the first quarter of graduate study; modifications may be made later. Detailed requirements and instructions are in the Handbook for Graduate Students in Electrical Engineering at Stanford University (http://ee.stanford.edu/ee/GradHandbook/html/GradHandbook/html).

Programs of at least 45 quarter units that meet the following guidelines are normally approved:

1. A sequence of three or more graded-electrical engineering courses numbered above 200, to provide depth in one area. The student must maintain an average 3.0 grade point average (GPA) or better in both the depth area and overall.

2. At least one EE course numbered above 200 in each of three additional course areas, outside of the area selected under item 1 to provide breadth.

3. Enough additional units of electrical engineering courses so that items 1 through 3 total at least 21 units of graded EE courses numbered above 200, including at least 9 units of such courses numbered in the 300s or 400s. Some 600- or 700-level summer courses may also be considered for inclusion in the M.S. program.

4. Additional course work to bring the total to 45 or more quarter units, including:
   a) at least 36 graded units
   b) at least 36 units at or above the 100 level
   c) at least 30 units in technical areas such as engineering, mathematics, and science; thesis and Special Studies units cannot be included among these 30 units

5. At least three quarters of EE seminars, including 201 in Autumn Quarter. In case of time conflicts, tapes of these classes can be viewed in the Terman Library.

Capable students without formal undergraduate preparation in electrical engineering may also be admitted for graduate study. Such students may have graduated in any field and may hold either the B.S. or A.B. degree. Each student, with the help of an adviser, prepares a program of study to meet his or her particular needs and submits it to the faculty for approval. A student with adequate preparation in mathematics through calculus and college physics including electricity can usually complete the M.S. degree requirements within two academic years. A student with some additional preparation in electrical engineering may be able to complete the M.S. requirements in only one academic year.

Graduate study in electrical engineering demands that students be adequately prepared in circuits, digital systems, electronics, fields, lab work, mathematics, and physics. Skill in using modern computing facilities is essential for electrical engineers, and an increasing number of our courses routinely require it. Skill should be acquired early in the program, either by taking one of the regular computer science courses or one of the special "short courses" given by the Computation Center, or by self-study.

It is the student's responsibility, in consultation with an adviser, to determine whether the prerequisites for advanced courses have been met. Prerequisite courses ordinarily taken by undergraduates may be included as part of the graduate program of study. However, if the number of these is large, the proposed program should contain more than the typical 45 units, and the time required to meet the degree requirements may be increased.

Permission to study beyond the M.S. degree must be obtained from the department (if possible, well before the M.S. degree is received). The student needs to file a Graduate Program Authorization Petition. Permission is predicated on the applicant's academic record, performance in independent work, potential for advanced study, and on the ability of the faculty to supervise such study. For the most recent information, see http://ee.stanford.edu/ee/GradHandbook/html/ms.html.

M.S. PROGRAM IN ELECTRICAL ENGINEERING (EE) AND MANAGEMENT SCIENCE AND ENGINEERING (MS&E)

Admission—For the dual degree, admission to both departments is required, but is coordinated by designated members of both Admissions Committees who make recommendations to the committees of their respective departments.

Advising—Every student in the dual degree program has one adviser in EE, and one in MS&E. In addition, a committee consisting of designated faculty from both departments serves as a review committee on performance and as an overseeing body of ongoing and graduating students of the program. The committee, consisting of designated members of both Admission Committees as described in the previous section, may initially serve as this overseeing body.

The Dual Degree Program—This dual-degrees program enables a small, selective set of graduate students to obtain both the MS&E master's degree and the EE master's degree simultaneously. Students complete the course requirements for each department. However, the total number of units required to complete the dual-degree is 72 (versus 90 if the two degrees were pursued separately), and the total number of full-time quarter residency equivalents required to complete the dual degree is six (students with a 50 percent teaching or research assistantship, who average 9 units per quarter, earn .62 of a full quarter of residence).

ENGINEER

The degree of Engineer requires a minimum of two academic years (90 quarter units) of study beyond the B.S. degree (three academic quarters beyond the M.S.) including six full-time quarters of approved work as a graduate student, of which a minimum of three quarters and 36 quarter units must be in residence at Stanford.

Work toward the degree of Engineer in Electrical Engineering normally includes the requirements for work toward the master's degree in Electrical Engineering, including qualifications for admission.

An additional year allows time for a broader program, or a more concentrated program, or whatever arrangement may seem suitable to the candidate, his adviser, and the department. Advanced study at other universities, or in other departments at Stanford, may be allowed within the foregoing consideration. The equivalent of approximately one quarter is devoted to independent study and thesis work with faculty guidance. The thesis is often of the nature of a professional report on the solution of a design problem. The degree of Engineer differs from the Ph.D. in that it prepares for professional engineering work rather than theoretical research. The candidate may select courses that are suitable for either the degree of Engineer or the Ph.D. degree and decide later which program to pursue.

The best procedure for the applicant to follow is (1) if now working toward the Stanford M.S. degree in Electrical Engineering, request permission to continue graduate studies beyond the master's degree, using the Graduate Program Authorization Petition form obtained from the Department of Electrical Engineering office, or (2) if not planning to receive the Stanford M.S. degree in Electrical Engineering, apply for admission to the Department of Electrical Engineering as a candidate for the degree of Engineer.

During the first quarter of work beyond the M.S. degree, formal application for admission to candidacy for the degree of Engineer is made on a form that can be obtained from the department office. The program of study is prepared by the student with the help of the thesis adviser and submitted to the academic associate for approval. The form should contain a list of all graduate courses completed at Stanford and elsewhere and all courses yet to be completed. For the most recent information, see http://ee.stanford.edu/ee/GradHandbook/html/engineer.html.

DOCTOR OF PHILOSOPHY

Admission to a graduate program does not imply that the student is a candidate for the Ph.D. degree. Advancement to candidacy requires superior academic achievement, satisfactory performance on a qualifying examination, and sponsorship by two faculty members. Enrollment in Electrical Engineering 391, Special Studies, is recommended as a means...
for getting acquainted with a faculty member who might be willing to serve as a supervisor.

Not later than the first Autumn Quarter after receiving the M.S. degree, the applicant should submit an application to take the department qualifying examination (given each Winter Quarter). Upon successful completion of the qualifying examination and after securing agreement by two faculty members to serve as dissertation advisers, the student should file an Application for Doctoral Candidacy. Only after receiving department approval to that application does the student become a candidate for the Ph.D. degree.

Requirements may be summarized as follows. The student must complete successfully (1) a minimum of three years of residence with graduate standing, two years of which must be in residence at Stanford; (2) one or more qualifying examinations given by the faculty of the Department of Electrical Engineering; (3) an approved program of courses in electrical engineering and allied subjects; (4) an approved topic of research and a written dissertation, based on research, which must be a contribution to knowledge; (5) an oral examination that is a defense of dissertation research and is taken near the completion of the doctoral program.

About one-fourth of the program of graduate study should be in departments other than Electrical Engineering. Courses shall be selected to form an integrated program, to be approved by the department. A student wishing to fulfill the requirements for a formal minor may elect to do so. For the most recent information, see http://ee.stanford.edu/ee/GradHandbook/html/phd.html.

**FINANCIAL ASSISTANCE**

The department annually awards a limited number of fellowships, teaching assistantships, and research assistantships to incoming graduate students. The fellowships are usually awarded only to first-year graduate students in the EE Master of Science program. Most awards to Engineer and Ph.D. candidates are research assistantships, which are awarded by individual faculty research supervisors working in conjunction with the department's Ph.D. Degree Committee. A grade point average (GPA) of at least 3.35 on these courses is required.

**THE HONORS COOPERATIVE PROGRAM**

Many of the department's graduate students are supported by the Honors Cooperative Program (HCP), which makes it possible for academically qualified engineers and scientists in nearby companies to be part-time graduate students in Electrical Engineering while continuing nearly full-time professional employment. Prospective HCP students follow the same admission process and must meet the same admission requirements as full-time graduate students. For more information regarding the Honors Cooperative Program, see the "School of Engineering" section of this bulletin.

**AREAS OF RESEARCH**

Candidates for advanced degrees participate in the research activities of the department as paid research assistants or as students of individual faculty members. At any one time, certain areas of research have more openings than others. A new applicant should express a second choice of research interest in the event that there are no vacancies in the primary area of interest. At present, faculty members and students are actively engaged in research in the areas listed below.

### COMPUTER SYSTEMS

- Asynchronous Circuits
- Compilers
- Computer-Aided Design
- Computer Architecture
- Computer Graphics
- Computer Networks
- Computer Organization
- Computer Reliability
- Concurrent Languages
- Concurrent Processes and Processors
- Database and Information Systems
- Distributed Systems
- Embedded System Design
- Hardware/Software Co-Design
- Hardware Verification
- Human Computer Interaction
- Multimedia Systems
- Operating Systems
- Performance Measurement and Modeling
- Programming Languages
- Program Verification
- Software Engineering
- VLSI Design

### INFORMATION SYSTEMS

- Adaptive Control and Signal Processing
- Adaptive Neural Networks
- Biomedical Signal Analysis
- Computer-Aided Design and Analysis of Systems
- Data Communications
- Digital Signal Processing
- Estimation Theory and Applications
- Fourier and Statistical Optics
- Information and Coding Theory
- Medical Imaging and Image Processing
- Multivariable Control
- Optical Communications
- Optimization-Based Design
- Pattern Recognition and Complexity
- Quantization and Data Compression
- Real-Time Computer Applications
- Signal Processing Algorithms and Architectures
- Speech and Image Coding

### INTEGRATED CIRCUITS

- Analog Integrated Circuits
- Bipolar, MOS, and other Device and Circuit Technologies
- CAD of Processes, Devices, and Equipment
- Custom Integrated Circuits for Computers and Telecommunications
- Digital Integrated Circuits
- Integrated Sensors and Actuators
- Mixed Signal Integrated Circuits
- Nanostructures
- Optoelectronic Integrated Circuits
- Process, Device, Circuit, and Equipment Modeling
- Sensors and Control for VLSI Manufacturing
- VLSI Device Structures and Physics
- VLSI Fabrication Technology
- VLSI Materials, Interconnections, and Contacts
- VLSI Packaging and Testing

### LASERS AND QUANTUM ELECTRONICS

- Coherent UV and X-Ray Sources
- Free-Electron Lasers
- Laser Applications in Aeronautics, Biology, Chemistry, Communications, Electronics, and Physics
- Laser Devices and Laser Physics
Nonlinear Optical Devices and Materials
Optoelectronic Devices
Photoacoustic Phenomena
Semiconductor Diode Lasers
Ultrafast Optics and Electronics

MICROWAVES, ACOUSTICS, AND OPTICS
Acoustic Microscopy
Acousto-Optic Devices
Fiber Optics
Holography
Microwave Integrated Circuits and Devices
Nondestructive Testing
Optical Interferometry
Scanning Optical Microscopes

SOLID STATE
Applied and Fundamental Superconductivity
Crystal Preparation: Epitaxy and Ion Implantation, and Molecular Beam Epitaxy
Defect Analysis in Semiconductors
Electron and Ion Beam Optics
Electron Spectroscopy
Experimental Determination of the Electronic Structure of Solids
High Resolution Lithography
Laser, Electron, and Ion Beam Processing and Analysis
Magnetic Information Storage
Magnetic Materials Fundamentals and Nanostructures
Nanostructure Fabrication and Applications
Molecular Beam Epitaxy
Novel Packaging Approaches for Electronic Systems
Optoelectronic Devices
Physics and Chemistry of Surfaces and Interfaces
Semiconductor and Solid State Physics
Solid State Devices: Physics and Fabrication
Ultrasmall Electron and Photodevices

SPACE PHYSICS AND RADIOSCIENCE
Detection of Electromagnetic Fields from Earthquakes
Electromagnetic Waves and Plasmas
Geomagnetically Trapped Radiation
Ionospheric and Magnetospheric Physics
Ionospheric Modification
Lightning Discharges
Lightning-Ionosphere Interactions
Planetary Exploration
Radar Interferometry
Radar Remote Sensing
Radio Wave Scattering
Remote Sensing of Atmospheres and Surfaces
Space Engineering (also see the “Space Science and Astrophysics” section of this bulletin)
Synthetic Aperture Radar Satellites
Ultra-Low Frequency Fluctuations of the Earth’s Magnetic Field
Very Low Frequency Wave Propagation and Scattering

TELECOMMUNICATIONS AND SPACE INFORMATION SYSTEMS
Applied Optics and Optoelectronics
Cellular Radio Systems/Networks
Coherent Optical Communications
Communication Channels
Digital Telephone Switching
Frequency Reuse in Large Wireless Systems
Mobility Issues in Large Networks
Multiple Access Techniques
Multipath Mitigation Techniques
Optical Fiber Communications
Optical Networks
Optoelectronic Components and Systems
Propagation in and around Buildings
Radar Signal Processing
Radiating Systems
Resource Allocation/Channel Assignment/Handoff
RF Excision in Support of Search for Extraterrestrial Intelligence
Satellite Communication Stations
Space Data Management
Spaceborne Radio Receiver Development
Telephone and Data Networks
Wavelength Division Multiplexing
Wireless Local Area Data Networks
Wireless Personal Communication Systems

COURSES
(WIM) indicates that the course meets the Writing in the Major requirements.
(AU) indicates that the course is subject to the University Activity Unit limitations (8 units maximum).

Electrical engineering courses are numbered according to the year in which the courses are normally taken.
20-99 first or second year
100-199 third or fourth year
200-299 mezzanine course for advanced undergraduates or graduates
300-399 first graduate year
400-499 second or third graduate year
600-799 special summer courses

The Department of Electrical Engineering (EE) offers courses in the following areas:
Communication Systems
Computer Hardware
Computer Software Systems
Control and Systems Engineering
Electronic Circuits
Electronic Devices, Sensors, and Technology
Fields, Waves, and Radioscience
Image Systems
Lasers, Optoelectronics, and Quantum Electronics
Network Systems
Signal Processing
Solid State Materials and Devices
VLSI Design

UNDERGRADUATE
17Q. Stanford Introductory Seminar: From Chips to Genes—Engineering the MicroWorld—Preference to sophomores. Lectures by instructor on the basic material followed by guest speakers from microelectronics, MEMS, and biotechnology. Reading assignments and student reports. Prerequisites: high school physics, know how a light microscope works, and the length of scales (meter, millimeter, micrometer, nanometer).

1-3 units, Win (Pease)

33Q. Stanford Introductory Seminar: Fun Electrical Engineering Stuff (and how it works)—Preference to sophomores. Prospective electrical engineering students are exposed to the capabilities and possibilities in their field, examining the functions and mechanisms of practical systems (toys, home appliances, computers, industrial and medical equipment), and breaking a problem into manageable pieces, recognizing patterns, and thinking beyond what is first seen. Combined lecture and lab; students disassemble and reassemble basic minimal electronics.

3 units, given 2001-02

44Q. Stanford Introductory Seminar: Physics, History, and Mystery of Lightning—Preference to sophomores. The physical properties
and phenomenology of lightning discharges. The history and mystique of lightning, emphasizing the role of this phenomena in religions and various age-old mythologies. Benjamin Franklin’s experiments and writings on lightning. The societal impacts of lightning in modern times and in the historical past. Different types of lightning, including discharges which occur at high altitudes above thunderclouds, lightning on other planets, lightning in volcanoes, and mysterious forms such as “ball” lightning. The physical properties of lightning and techniques for their measurement.

3 units, given 2001-02

47Q. Stanford Introductory Seminar: Telecommunications and Networks—From Telegraphy to the Internet—Preference to sophomores. Modern communications technology and networking, including the Internet. How the global communications infrastructure evolved from the “plain old telephone service” of 1900 to today’s multimedia “information super-highway.” A historical perspective of the evolution of communications technology, including advancements in communications theory and practical inventions over 200 years. Relevant public policy decisions in the U.S., (the Mann-Elkins Act of 1910 to the Telecommunications Reform Act of 1996). The political goals of these policies, their history with market forces, and their impact on the development and employment of technology.

3 units, Aut (D. Harris)

60Q. Stanford Introductory Seminar: Man vs. Nature—Coping with Disasters using Space Technology—(Same as Geophysics 60Q.) Preference to sophomores. Natural hazards (earthquakes, volcanoes, floods, hurricanes, and fires) affect thousands of people everyday. Twenty years of developments in spaceborne imaging technology help monitor and respond to such disasters more rapidly than in the past, saving lives and money. Understanding the physical processes involved allows us to anticipate and plan for mitigation of the consequences of the disasters. Students consider how these new tools are applied to natural disasters, and how remotely-sensed data are manipulated and analyzed.

3 units, Aut (Zebker)

93Q. Stanford Introductory Seminar: Energy Processes—Preference to sophomores. Serves as preparation for 293A,B. Topics in non-traditional energy processes. Students groups of 2 or 3 each select one topic for further investigations. Progress reports, final report. Discussions on the physics and chemistry of the processes, concentrating on a journalistic description of what is being accomplished in each area and the near term prospects. Prerequisite: interest in science and engineering in the energy area.

3 units, Aut (da Rosa)

101. The Electrical Engineering Profession—Lectures/discussions on topics of importance to the electrical engineering profession. Continuing education, professional societies, intellectual property and patents, ethics, entrepreneurial engineering, and engineering management. Extensive reports for 2 units. (AU)

1-2 units, Aut (Gray)

3 units, Win (El Gamal)

3 units, Aut (Nishimura)

104. Signal Processing and Communication—Introduction to communication systems, Fourier series and Fourier transforms, filtering and signal distortion, time domain and frequency domain analysis, communication channel modulation (FM), digital modulation, noise in communication systems, overview of cellular telephones, satellite systems. Prerequisite: 103.

3 units, Win (Goldsmith)

105. Feedback Control Design—(Enroll in Engineering 105.)

3 units, Aut (Enge)

Win (Franklin)

106. Planetary Exploration—The other worlds of our solar system as revealed by recent space missions. Comparative properties of the terrestrial and Jovian planets; planetary atmospheres, surfaces, interiors, and rings; planetary and satellite orbits and spacecraft trajectories, orbital perturbations; properties of the interplanetary gas, dust, comets, and meteorites. What the planets can tell us about potential terrestrial catastrophes (acid rain, ozone depletion, nuclear winter, runaway greenhouse, collision with an asteroid or large comet). Origin and evolution of planetary systems. Remote sensing from spacecraft at radio, infrared, light, and ultraviolet wavelengths. U.S. and Russian space programs and their comparative engineering and scientific aspects. Prerequisite: one year of college engineering, mathematics, or physics.

3 units, Spr (Fraser-Smith)

111. Electronics I—The fundamental operation of semiconductor devices and their circuit applications. The physical principles of semiconductors, emphasizing silicon technology; operating principles and device equations for PN diodes, biasing, small-signal models, and elementary circuit applications of diodes. Prerequisite: Engineering 40. Corequisite: 101.

4 units, Aut (Wong)

112. Electronics II—Basic operating principles and device equations for MOS capacitors and transistors, and bipolar junction transistors. The basics of transistor amplifier and logic circuit design using MOS transistors. Weekly one-hour recitation session. Prerequisites: 101, 111.

4 units, Win (Wong)

113. Electronic Circuits—Bipolar and MOS amplifier design including DC bias, small signal performance, multistage amplifiers, frequency response, feedback. Design and use of operational amplifiers. Prerequisites: 102, 112.

3 units, Spr (Staff)

121. Digital Design Laboratory—Introduction to digital circuits and logic design. Topics: Boolean algebra, logic circuit electrical characteristics, combinational and sequential logic building blocks, state machines, programmable logic devices, hierarchical logic design, computer-aided design and logic simulation. Lab. Prerequisite: Engineering 40. (WIM)

4 units, Aut (Pearsse)

Win (Gill)

122. Analog Laboratory—Introduces the practical applications of analog circuits, including simple amplifiers, filters, oscillators, power supplies, and sensors. Goals: lab experience, basic design skills, experi-
ence with computer-aided design, and basic circuit fabrication/debugging knowledge. Prerequisite: Engineering 40 or equivalent.

3 units, Aut, Spr (Kovacs)

133. Analog Communications Design Laboratory—The design and testing of analog communications circuits, including applications. Amplitude modulation (AM) using discrete multiplier circuits and fully integrated implementations. Phase and Frequency Modulation (FM) based on discrete and integrated modulator circuits such as voltage-controlled oscillators (VCOs). Phased-Lock Loop (PLL) techniques, characterization of key parameters and their applications. Lectures on the practical aspects of circuit implementations. Labs involve the systematic building and characterization of AM, FM, and PLL circuits and subsystems. Enrollment limited to 40 undergraduate and coterminal EE students. Prerequisite: 122.

3 units, Win (Dutton)

137. Laboratory Electronics—(Enroll in Applied Physics 207.)

138. Laboratory Electronics—(Enroll in Applied Physics 208.)

140. The Earth from Space: Introduction to Remote Sensing—(Enroll in Geophysics 40.)

4 units, Aut (Inan)

3 units, Win (Inan)

144. Wireless Electromagnetic Design Laboratory—Required for undergraduate Fields and Waves specialty area. Lecture, lab, and design project. Hands-on experiments and projects with antennas, transmission lines and propagation for wireless communications and remote sensing. Using spectrum analysers, swept frequency generators, frequency counters, couplers, detectors and slotted lines, develop measurement and design capability in the 1-20 GHz range in support of chosen design projects. Two- to three-person team projects on antenna, guided wave distributed circuits, remote sensing, or related topics. Working model construction and demonstration; some funding available for project costs. Prizes for best projects. Lab. Enrollment limited to 30. Prerequisites: 122, 142, or consent of instructor.

3 units, Spr (Leeson)

168. Introduction to Digital Image Processing—Introduction to processing of digital 2-D and 3-D data, combining theoretical material with implementation of computer algorithms. Topics: time and frequency representations of images, filters, image formation and enhancement, imaging systems, and applications. Computer lab exercises implement practical algorithms.

3-4 units, Win (Zebker)
graduates in industry (large, medium, and small), start-up companies, government laboratories, and community colleges. (AU)

1 unit, Win (Reis)

202. Medical Electronics—Open to non-electrical engineering students. Primarily biological in nature. Introduces electrical engineers to the physiological and anatomic aspects of medical monitoring and imaging. Biological content, transducers, electronic systems, the socioeconomic impact, and the constraints unique to medicine. Recommended: some familiarity with circuits and electrical instrumentation techniques (e.g., 113).

3 units, Aut (Thompson)

203. The Entrepreneurial Engineer—Seminar furthers the knowledge base of prospective entrepreneurs with an engineering background. The contributions made to the business world by engineering graduates. Speakers include Stanford (and other) engineering and M.B.A. graduates who have founded large and small companies in nearby communities. Contributions from EE faculty members and other departments (law, business, and industrial engineering). (AU)

1 unit, Win (Melen)

205. Introduction to Control Design Techniques—(Enroll in Engineering 205.)

206. Control System Design and Simulation—(Enroll in Engineering 206.)

207D. Optimal Control and Hybrid Systems—(Enroll in Aeronautics and Astronautics 278A).

209A. Analysis and Control of Nonlinear Systems—(Enroll in Engineering 209A.)

209B. Advanced Nonlinear Control—(Enroll in Engineering 209B.)

212. Integrated Circuit Fabrication Processes—For students interested in IC design and the influence of fabrication processes, or intending to pursue doctoral research involving use of Stanford’s IC laboratory. Process simulators are used to illustrate concepts and provide a “virtual” lab experience. Topics: the fundamental principles of integrated circuit fabrication processes, physical and chemical models for crystal growth, oxidation, ion implantation, etching, deposition, lithography, and back-end processing. Required for 410. Prerequisite: 112 or equivalent.

3 units, Aut (Plummer)

213. Heat Transfer in Microdevices—(Enroll in Mechanical Engineering 258.)

3 units, Aut (Lee)

216. Principles and Models of Semiconductor Devices—The fundamentals of carrier generation, transport, recombination, and storage in semiconductors. The physical principles of the operation of the p-n junction, metal semiconductor contact, bipolar junction transistor, MOS capacitor, MOS and junction field-effect transistors, and related devices such as CCDs and solar cells. First-order device models that reflect physical principles and are useful for integrated-circuit analysis and design. Prerequisites: 111, 112, or equivalent.

3 units, Aut (Saraswar)

217. Electron and Ion Beams for Semiconductor Processing—Focused and flood beams of electrons and ions are employed for processing semiconductor devices. The generation of such beams including thermionic emission, field-induced emission, first-order focusing, and glow discharge processes. The interactions of such beams with the target, including scattering in solids, the distribution of energy, heating, sputtering, beam-induced etching (including reactive-ion etching) and beam-induced deposition. Introduction to computer modeling of etching and deposition. Prerequisite: 212 or equivalent.

3 units, Spr (Pease) alternate years, not given 2001-02

222. Applied Quantum Mechanics I—Introduction to quantum mechanics, with emphasis on applications in modern devices and systems. Topics: Schrödinger’s equation, eigenfunctions and eigenvalues, operator approach to quantum mechanics, solutions of simple problems (including quantum wells, harmonic oscillators, simple periodic structures), tunneling, calculation techniques (including matrix diagonalization, perturbation theory, variational method), time-dependent perturbation theory (including application to optical absorption), fundamental postulates of quantum mechanics.

3 units, Aut (Miller)

223. Applied Quantum Mechanics II—Continuation of 222, including more advanced topics: spin and identical particles, effective mass theory for semiconductors, annihilation and creation operators, density matrices, introductory quantum optics, and other topics in electronics, optoelectronics and optics. Prerequisite: 222.

3 units, Spr (Miller)

228. Basic Physics for Solid State Electronics—Advanced undergraduate/graduate, introducing the physics underlying modern solid state materials and devices. Topics: the energy band theory of solids, energy bandgap engineering, classical kinetic theory, statistical mechanics, equilibrium and non-equilibrium semiconductor statistics. Prerequisites: 112, Physics 70.

3 units, Aut (J. Harris)

229B. Thin Film and Interface Microanalysis—(Enroll in Materials Science and Engineering 323.)

229D. Introduction to Magnetism and Magnetic Materials—(Enroll in Materials Science and Engineering 347.)

231. Lasers I—Introduction to lasers and how they work, including quantum transitions in atoms, stimulated emission and amplification, rate equations, saturation, feedback, coherent optical oscillation, laser resonators, and optical beams. Limited primarily to steady-state behavior; uses classical models for atomic transitions with little quantum mechanics background required. Prerequisites: electromagnetic theory to a level of at least 142, preferably 241, and some knowledge of atomic or modern physics such as Physics 57 or 130-131.

3 units, Aut (Solgaard)

232. Lasers II—Continuation of 231, emphasizing dynamic and transient effects including spiking, Q-switching, mode locking, frequency modulation, frequency and spatial mode competition, linear and nonlinear pulse propagation, short pulse expansion, and compression. Prerequisite: 231.

3 units, Aut (Siegman)

238. Electrical and Magnetic Properties of Solids—(Enroll in Materials Science and Engineering 209.)

241. Waves I—Introduction to waves and wave phenomena as they appear in different natural, lab, and application settings. Electromagnetic, acoustic, seismic, atmospheric, plasma, and water waves and their mathematical and physical correspondence in terms of Hamilton's principle. Propagation, attenuation, reflection, refraction, surface and laminar guiding, and intrinsic and structural dispersion; energy density, power flow, and phase and group velocities. Geometric and structural complexities are minimized to stress basic wave concepts common to diverse fields of application. Analysis in terms of transmission line and impedance concepts using exponential notation and vector phasors. Treatment limited to plane harmonic waves in isotropic media. Nonhomogeneous cases limited to plane interfaces and exponentially stratified media. Prerequisite: 142 or equivalent, or other wave course.

3 units, Aut (Tyler)

243. Semiconductor Optoelectronic Devices—Introduction to semiconductor optoelectronic devices for communications and other applications, covering operating principles and practical device features. Review of relevant semiconductor physics, and optical processes in semiconductors. Semiconductor heterostructures. Semiconductor optical detectors (including p-i-n, avalanche, and MSM), light emitting diodes, electroabsorptive modulators (Franz-Keldysh, QCSE), electrorefractive (directional couplers, Mach-Zehnder), switches (SEEDs), and lasers (waveguide and vertical cavity). Prerequisites: basic quantum mechanics, solid state physics, lasers (e.g., 222, 228, 231, or equivalents).

3 units, Win (J. Harris)

244. Communication Engineering Transmission Systems—Design of transmission systems for TV, telephone, and data-using satellites; microwave repeaters; mobile radio; and broadcast transmitters. Performance of FM, AM, SSB common digital schemes and spread-spectrum modulation, time, frequency, and code multiplexing. Emphasis is on link performance, capacity, total system design, and cost optimization. Current industry design problems and research results. Examples illustrate modern technologies providing service to rural populations. Prerequisite: senior or graduate standing in Electrical Engineering, or consent of instructor.

3 units, Aut (Lasignano)

245. Wireless Electromagnetic Design Laboratory—See 144.

3 units, Spr (Leeson)

246. Microwave Engineering—Coherent development of the concepts and applications of distributed circuits. Emphasis is on MI structures (microstrip, coplanar waveguide, slotline, finline, and imageguide) capable of transmitting millimeter wave analog signals and picosecond pulses. Modal properties (TEM, quasi-TEM, TE, TM) of general guide lines. Higher order mode excitation effects at discontinuities (steps, bends, etc.) and junctions are modeled by lumped equivalent circuits, using Z- Y- and S-matrix representations. Dispersion, attenuation, and distributed source excitation in distributed circuits. Analysis of circuit components (impedance transformers, directional couplers, hybrids, circulators, filters, solid state amplifiers). Illustrations of IC circuit structures. Computer-aided design principles. Recommended: 142 or equivalent.

3 units, alternate years, given 2001-02

3 units, Aut (Kazovsky)

3 units, Aut (Yamamoto)

249. Introduction to the Space Environment—Experimentation in the near-earth space environment using radio and other electromagnetic waves, and electric and magnetic instrumentation on space probes. Tools used: transmitters, antennas, receivers, sensors, radars, and displays. The earth's ionosphere, magnetosphere, and interplanetary space. The role of the sun, and the effects produced by changes in solar activity. Geoelectric and geomagnetic fields. Charged particle motion, trapped particles (Van Allen radiation), and the aurora. Applications to current experimental programs. Planning and execution of experiments. Prerequisites: familiarity with electromagnetics at the level of 142 and senior or graduate standing.

3 units, alternate years, given 2001-02

3 units, Spr (Tyler) alternate years, not given 2001-02

254. Principles of Radar Systems—Analysis and design, emphasizing radars as systems. Radar equation and systems parameters, components of radar systems, radar cross-section and target characteristics, signal detection in noise, ambiguity function (with applications to measurement precision, resolution, clutter rejection, and waveform design); pulse compression waveforms, synthetic aperture radar, tracking and scanning radars, HF (OTH) radar, radar environmental and remote sensing, radar astronomy. Prerequisite: senior undergraduate or graduate standing.

3 units, alternate years, given 2001-02

261. The Fourier Transform and its Applications—The Fourier transform as a tool for solving physical problems. Fourier transform of discrete and continuous time signals, generalized transforms, and Fourier series. Convolutions and correlations, the Dirac delta function, Fourier transform theorems, measures of time duration and bandwidth, analysis of linear systems, sampling theorems, the discrete Fourier transform, and two-dimensional Fourier analysis. Prerequisite: previous exposure to Fourier series at the level of 102.

3 units, Spr (Inan) alternate years, not given 2001-02

262. Two-Dimensional Imaging—Time and frequency representations, two-dimensional auto- and cross-correlation, Fourier spectra, diffraction and antennas, coordinate systems and the Hankel and Abel transforms, line integrals, impulses and sampling, restoration in the presence of noise, reconstruction and tomography, imaging radar. Students create software to form images using these techniques using actual data. Prerequisites: 261. Recommended: 278, 279.

3 units, Aut (Zebker)

263. Introduction to Linear Dynamical Systems—Introduction to applied algebra and linear dynamical systems, with application to circuits, signal processing, communications, and control systems. Topics: least-squares approximations of over-determined equations and least-norm solutions of underdetermined equations. Symmetric matrices, matrix norm, and singular value decomposition. Eigenvalues, left and right eigenvectors, with dynamical interpretation. Matrix exponential, stability, and asymptotic behavior. Multi-output systems, impulse and step matrices; convolution and transfer matrix descriptions. Control, reachability, and state transfer. Least-norm inputs and associated Gramians. Observability and least-squares state estimation. Prerequisites: exposure to basic linear algebra and matrices (as in Mathematics 103); differential equations and Laplace transforms (as in 102).

3 units, Aut (Boyd)

3 units, Aut (Widrow)

265. Signal Processing Laboratory—Designed for undergraduate and graduate students, applying 101, 102, 103 to real-world signal processing applications. Lab exercises use a programmable DSP to implement signal processing tasks. Topics: A/D conversion and quantization, filter design and implementation, spectral analysis, voice codes, audio signal processing, image and video compression.

3 units, Win, Spr (Meng)

268. Introduction to Modern Optics—Geometrical optics: raytraces, Gaussian beams, optical instruments, and radiometry. Wave nature of light: Maxwell's equations, propagation through media with varying index of refraction (e.g., fibers). Interferometry: basic principles, practical systems, and applications.

3 units, alternate years, given 2001-02

271. Introduction to VLSI Systems—Large-scale MOS design. Topics: MOS transistors, static and dynamic MOS gates, MOS circuit fabrication, design rules, resistance and capacitance extraction, power and delay estimation, scaling, MOS combinational and sequential logic design, registers and clocking schemes, memory, data-path, and control-unit design. Elements of computer-aided circuit analysis, synthesis, and layout techniques. Prerequisites: 112; familiarity with circuits, logic design, and digital system organization.

3 units, Aut (Horowitz)

Spr (DeMicheli)

272. Design Projects in VLSI Systems—For students with research and applications interest in VLSI systems. Teams of two complete modest-sized CMOS chip of their own design, including writing a functional model (in Verilog), using synthesis tools, custom layout, and simulation. Overview of the issues involved in VLSI design. Topics: design tools and techniques, complexity management, clocking issues, layout and floor-planning, design of large array structures, testing and testability issues. Lab. Prerequisites: 271, experience with digital design.

4 units, Win (Horowitz)

273. Digital Systems Engineering—Fundamental electrical issues in the design of high-performance digital systems, including signaling, timing, synchronization, noise, and power distribution. High-speed signaling methods; noise in digital systems, its affect on signaling, and methods for noise reduction; timing conventions; timing noise (skew and jitter), its affect on systems, and methods for mitigating timing noise; synchronization issues and synchronizer design; clock and power distribution problems and techniques; impact of electrical issues on system architecture and design.

3 units, Win (Daily)

274. Introduction to Cryptography and Computer Security—(Enroll in Computer Science 255.)

275. Logic Design—(Formerly 381.) Principles and techniques of logic design. Combinational circuit analysis (hazard detection); combinational circuit design including PLA, VLSI, and MSI techniques and testing techniques; IC logic families, flip-flop properties, sequential circuit analysis and synthesis for fundamental and pulse mode circuits, design for testability techniques. Prerequisite: 121 or equivalent.

3 units, Aut, Win (McCloskey)

3 units, Spr (Cox)

277. Stochastic Decision Models—(Enroll in Management Science and Engineering 251.)

278. Introduction to Statistical Signal Processing—Random variables, vectors, and processes; time averages, expectations, and laws of large numbers; stationarity, autocorrelation, and spectral analysis; mean square error estimation, detection, and linear filtering; independent increment, Gaussian, and Poisson random processes. Prerequisite: 177 or 178, and linear systems and Fourier transforms at the level of 102 or 261.

3 units, Aut (El Gamal)

Win (Prabhakar)

279. Introduction to Communication Systems—Analysis and design of communication systems; analog and digital modulation and demodulation, frequency conversion, multiplexing, noise and distortion; spectral and signal-to-noise ratio analysis, error ratios in digital systems. Prerequisites: 102 or 261, 278.

3 units, Win (Cox)
281. Embedded System Design Laboratory—Lectures on the architecture and design of microprocessor-based systems. Lab experiments use Microchip PIC16C74 microcontroller evaluation board. Five-week individual design project. Lab. Prerequisites: 121, and 181 or 182 or equivalent experience in assembly language programming.

3 units, Aut (Gill)

282. Computer Architecture and Organization—The structure of systems using processors, memories, input/output (I/O) devices, and I/O interfaces as building blocks. Computer system instruction set design and implementation, including memory hierarchies and pipelining. Issues and tradeoffs involved in the design of computer system architectures with respect to the design of instruction sets. Prerequisite: 182.

3 units, Aut, Win (Rosenblum)

283. Compilers—(Enroll in Computer Science 143.)

284. Introduction to Computer Networks—Structure and components of computer networks; functions and services; packet switching; layered architectures; ISO’s Open Systems Interconnections (OSI) reference model; physical layer; data link layer; error control; window flow control; media access control protocols used in local area networks (Ethernet, Token Ring, FDDI) and satellite networks; network layer (datagram service, virtual circuit service, routing, congestion control, IP); transport layer (UDP, TCP); application layer.

3-4 units, Aut (Tobagi)

Win (enroll in Computer Science 244A)

285. Programming Languages—(Enroll in Computer Science 242.)

286A. Operating Systems and Systems Programming—(Enroll in Computer Science 140.)

286B. Advanced Topics in Operating Systems—(Enroll in Computer Science 240.)

287. Introduction to Computer Graphics—(Enroll in Computer Science 24B.)

289. Introduction to Computer Vision—(Enroll in Computer Science 223B.)

290A,B,C. Curricular Practical Training for Electrical Engineers—For EE majors who need relevant work experience as part of their program of study. Final report required. Prerequisite for 290B: candidate for Engineer or Ph.D. in Electrical Engineering. Prerequisite for 290C: candidate for Ph.D. degree in Electrical Engineering.

1 unit, Aut, Win, Spr (Gray)

292. Special Seminars—Special seminars and experimental courses are given on topics of current interest by specialists in the field. Announcements are made one or two quarters prior to presentation. See Time Schedule and bulletins in the department office for current listing. By arrangement

3 units, Aut (da Rosa)

3 units, Win (da Rosa)

GRADUATE

300. Master’s Thesis and Thesis Research—For students who wish to do independent work under the direction of a department faculty member as part of their master’s degree program. Written thesis is required for final letter grade. The continuing grade ‘N’ is given in quarters prior to the thesis submission. (See 390 if a letter grade is not appropriate.)

by arrangement

310. Integrated Circuits Technology and Design Seminar—In-depth treatment of device structures, fabrication technologies, and circuit design issues in integrated circuits. Introduces current research topics in these areas. (AU)

1 unit, Aut (Lee, Wooley)

311. Advanced Integrated Circuit Fabrication—What are the practical and fundamental limits to the evolution of the technology of modern MOS and bipolar devices? How are modern devices and circuits fabricated and what future changes are likely? Advanced techniques and models of device and back-end (interconnect and contact) processing. Use of SUPREM and PISCES for process modeling. MOS and bipolar process integration. Prerequisites: 212, 216.

3 units, Spr (Saraswat)

312. Solid-State Sensors and Actuators—Surveys solid-state sensors and actuators, focusing on the use of integrated circuit fabrication technology for their realization. Categories of sensors and actuators are biological, chemical, mechanical, optical, thermal, etc. Basic mechanisms of transduction, fabrication techniques, and the relative merits of different technologies. Micromachining techniques for monolithic integration of active circuits with sensors or actuators and directions for future research. Prerequisite: 212.

3 units, Win (Kovacs)

3 units, Win (Horowitz)

314. RF Circuit Design—Design of RF integrated circuits for communications systems. Topics: the design of low-noise amplifiers at RF, passive and active filters, mixers, modulators, and demodulators; review of classical control concepts necessary for oscillator design including PLLs and PLL-based frequency synthesizers. Design of high-efficiency (e.g., class E, F) RF power amplifiers, coupling networks. Behavior and modeling of passive and active components at RF. Prerequisite: 214.

3 units, Win (Lee)

315. VLSI Data Conversion Circuits—Design of mixed-signal integrated circuits for implementing the interfaces between analog and digital signals in CMOS VLSI systems. Fundamental circuit elements such as sample-and-hold circuits, comparators, voltage references, operational amplifiers, gain blocks, and analog integrators. The design of the constituent circuits for Nyquist-rate and oversampling analog-to-digital and digital-to-analog converters, sampled-data and continuous-time analog filters, and digital decimation and interpolation filters. Prerequisite: 214.

3 units, Spr (Wooley)

316. Advanced VLSI Devices—In modern VLSI technologies, MOS and bipolar device electrical characteristics are sensitive to structural details and therefore to fabrication techniques. How are VLSI devices
317. Micropatterning for Integrated Circuits—The fundamentals of generating submicron patterns in integrated circuit manufacturing. Technologies include the formation of submicron images of ultraviolet light, the resulting exposure of polymeric resists, the subsequent development of resist patterns and their transfer into functional circuit material patterns through plasma etching and other techniques. The use of phase-shifting masks and other wavefront-engineering approaches. Extensive hands-on use of computer simulations of each of the above steps. Prerequisites: 141 or equivalent, 212 or equivalent, basic competence in computing.

3 units, alternate years, given 2001-02

318. Logic Synthesis of VLSI Circuits—Solving logic design problems with CAD tools for VLSI circuits. Analysis and design of exact and heuristic algorithms for logic synthesis. Topics: representation and optimization of combinational logic functions (encoding problems, binary decision diagrams), representation and optimization of multiple-level networks (algebraic and Boolean methods, “don’t care” set computation, timing verification, and optimization), modeling and optimization of sequential functions and networks (retiming), semicustom libraries and library binding. Prerequisites: familiarity with logic design, algorithm development, and programming.

3 units, Win (DeMicheli)

319. Computer-Aided System Design Laboratory—Computer-aided design of VLSI systems: theory and practice. Topics: modeling languages (e.g., Verilog), high-level synthesis and optimization methods (scheduling, binding, data-path, and control synthesis), design of systems with low-power consumption, and hardware/software co-design. Individual/group projects involve the use of CAD tools. Prerequisite: 318.

3 units, Spr (DeMicheli)

320. Automatic Formal Verification Techniques—(Enroll in Computer Science 356.)

325. Principles of Magnetic Recording—(Enroll in Materials Science and Engineering 348.)

326. Organic Materials for Electronic and Photonic Devices—(Enroll in Materials Science and Engineering 343.)

327. Properties of Semiconductor Materials—Modern semiconductor devices and integrated circuits are based on the unique energy band, carrier transport, and optical properties of semiconductor materials. These physical properties can be chosen and optimized for operation of semiconductor devices. Emphasis is on the quantum mechanical foundations of the properties of solids, energy bandgap engineering, semiclassical transport theory, semiconductor statistics, carrier scattering, electro-magneto transport effects, high field ballistic transport, Boltzmann transport equation, quantum mechanical transitions, optical absorption, and radiative and non-radiative recombination. Prerequisites: 216, 228.

3 units, Win (J. Harris)

328. Physics of Advanced Semiconductor Devices—The principles governing the operation of modern semiconductor devices. Underlying assumptions and approximations commonly made in analyzing devices. Emphasis is on the application of semiconductor physics to the development of advanced semiconductor devices (e.g., heterojunctions, HJ-FETs, nano structures, tunneling, single electron transistor and photonic devices). Use of ATLAS and MEDICI 2-D Poisson solvers for simulation of ultra-small devices. Examples are related to up-to-date device research.

3 units, alternate years, given 2001-02

329. The Electronic Structure of Surfaces and Interfaces—Basic physical concepts and phenomena for surface science techniques probing the electronic structure of surfaces and interfaces. Microscopic and atomic models in understanding microstructures have technologically important applications, e.g., within semiconductor device technology and catalysis. The basic physical processes of low energy electron diffraction, Auger electron spectroscopy, UV and x-ray photoemission spectroscopy, electron/photon stimulated ion desorption, inelastic tunneling spectroscopy, ion scattering, surface EXAFS, and energy loss spectroscopy; and experimental aspects of these surface science techniques. Prerequisites: Physics 70 or equivalent; 238 or consent of instructor.

3 units, Aut (Pianetta) alternate years, not given 2001-02

335. Introduction to Information Storage Systems—Introduction to state-of-the-art data storage technologies at materials, device, and system levels. Magnetic disk recording, optical recording, and magneto-optic recording. System considerations of noise, signal-to-noise ratio, error rates, error-correction coding, and detection channels. Introduction to selected emerging information storage technologies. Recommended: college level general physics, electromagnetism.

3 units, Win (Wang)

338A. Quantum Optics and Measurements—(Enroll in Applied Physics 387.)

338B. Mesoscopic Physics and Nanostructures—(Enroll in Applied Physics 388.)
3 units, given 2001-02

349. Advanced Modern Optics—Holography (basic principles, Bragg holography); photorefractive effect (physical principles and applications); wave matter interactions (polarization effects); vigorous coupled wave analysis. Prerequisite: 268 or 366, or equivalent. 
3 units, Spr (Hesselink) alternate years, not given 2001-02

350. Radioscience Seminar—Seminars by university and industrial researchers on topics from space physics, planetary exploration, ionospheric and magnetospheric physics, radar and remote sensing of the environment, applied electromagnetics, waves in optical fibers, and information systems with space applications. Student-faculty discussions. (AU) 
1 unit, Aut (Tyler) 
Win (Inan) 
Spr (Fraser-Smith)

351. Digital Switching in Telecommunications—Switching fundamentals; space and time division switching; blocking probability analysis; rearrangeable networks; self-routing networks; ATM switching architectures; performance evaluation of ATM switches; network synchronization and signaling methods. Prerequisite: 374 or basic knowledge of telecom systems. 
3 units, Spr (Narasimha)

352. Electromagnetic Waves in the Ionosphere and Magnetosphere—Magnet-ionic theory in multi-component media, signal dispersion, group ray velocity, wave polarization, refractive index surfaces, ray tracing, absorption, boundary effects, interpretation of natural phenomena (whistlers, VLF emissions), remote sensing in plasmas, communication theory of wave-particle interactions in the magnetosphere. Prerequisite: 142 or equivalent. 
3 units, Spr (Helliswll) alternate years, not given 2001-02

354. Introduction to Radio Wave Scattering—Integral and differential equations of radio wave scattering; exact, approximate, and numerical solutions of single particle scattering for spheres, edges, points, and cylinders. Scattering from rough surfaces with large and small roughness scales, as time permits. Multiple scattering; formulation and solution techniques for equation of transfer in discrete media and scattering by continuous media in weak and strong regimes. Applications to radar, radar astronomy, remote sensing, and biological media. Prerequisites: 241 or equivalent, and partial differential equations, or consent of instructor. 
3 units, Win (Tyler) alternate years, not given 2001-02

355. Imaging Radar and Applications—Radar remote sensing, radar image characteristics, viewing geometry, range coding, synthetic aperture processing, correlation, range migration, range/Doppler algorithms, wave domain algorithms, polar algorithms, polarimetric processing, interferometric measurements. Applications: polarimetry and target discrimination, topographic mapping surface displacements, velocities of ice fields. Prerequisites: 254, 261. Recommended: 264, 278, 279. 
3 units, alternate years, given 2001-02

3 units, alternate years, given 2001-02

357. Microstructures Fabrication Laboratory—Enrollment preference to students pursuing doctoral research programs requiring the use of the Ginzton microfabrication facility. Projects on the application of microfabrication technologies to exploratory devices. Planar fabrication techniques including contact lithography, vacuum deposition, and chemical etching. Use of analytical instruments including the scanning electron microscope, surface profilometer, and wafer probe station. Prerequisites: 212 or 333, consent of instructor. 
3 units, Sum (Khuri-Yakub)

358A. Lasers Laboratory—(Enroll in Applied Physics 304.)

358B. Nonlinear Optics Laboratory—(Enroll in Applied Physics 305.)

359. Wireless Communication—Performance of digital modulation in fading and intersymbol interference; flat fading countermeasures—diversity, coding and interleaving, adaptive modulation; intersymbol interference countermeasures; equalization, multicarrier modulation, spread spectrum and RAKE receivers; multiple access—FDMA, TDMA, CDMA; cellular mobility issues, capacity and area spectral efficiency. Prerequisite: 276. 
3 units, Aut (Goldsmith)

360. Advanced Topics in Wireless Communications—Current research areas in wireless communications: new theoretical developments, system design issues, and implementation constraints. Possible topics: adaptive modulation and coding, OFDM, spread spectrum, multicarrier spread spectrum, smart antennas, multuser detection, cellular system design, dynamic resource allocation, handoff and mobility management, access and channel assignment, system capacity, packet radio networks. Focus is on multiple access, cellular system design, packet radio networks. Prerequisites: 276 and 359. 
3 units, Spr (Goldsmith) alternate years, not given 2001-02

361A. Modern Control Design I—(Enroll in Engineering 207A.)

361B. Modern Control Design II—(Enroll in Engineering 207B.)

362. Applied Vision and Image Systems—(Enroll in Psychology 221.)

363. Linear Dynamic Systems—Continuation of 263. Optimal control and dynamic programming; linear quadratic regulator. More on Lyapunov theory and methods. Time-varying and periodic systems. Realization theory. Linear estimation and the Kalman filter. Examples and applications from digital filters, circuits, signal processing, and control systems. Prerequisites: 263 or equivalent, basic probability as in Statistics 116 or 278. 
3 units, given 2001-02

364. Convex Optimization with Engineering Applications—Recognizing and solving convex optimization problems that arise in engineering. Convex sets, functions, and optimization problems. The basics of convex analysis and theory of convex programming: optimality conditions, duality theory, theorems of alternative, and applications. Least-squares, linear and quadratic programs, semidefinite programming, geometric programming, extremal volume, etc. Numerical algorithms for smooth unconstrained problems; interior-point and ellipsoid methods for constrained problems. Applications to signal processing, communi-
369A. Medical Imaging Systems I—Imaging internal structures within the body using high-energy radiation studied from a systems viewpoint. Modalities covered: x-ray, computed tomography, and nuclear medicine. Analysis of existing and proposed systems in terms of resolution, modulation transfer function, detection sensitivity, noise, and potential for improved diagnosis. Prerequisite: 261.
3 units, alternate years, given 2001-02

369B. Medical Imaging Systems II—Imaging internal structures within the body using non-ionizing radiation studied from a systems viewpoint. Modalities include ultrasound and magnetic resonance. Analysis of ultrasonic systems including diffraction and noise. Analysis of magnetic resonance systems including including physics, Fourier properties of image formation, and noise. Prerequisite: 261.
3 units, Spr (Nishimura)

370. Information Systems Seminar—Lectures/discussion of topics and research areas in information systems. Topics: communication and information theory, signal processing, systems and control, and optical information processing. (AU)
1 unit, Aut, Win, Spr (Staff)

371. Advanced VLSI Circuit Design—Overview of important issues in high performance digital VLSI design. Focus is from a system perspective (a fast processor, DSP, etc.), CMOS, circuits. Topics: wire modeling, logic families, latch design and clocking issues, clock distribution, RAMs, ALUs, I/O and I/O noise issues. Final project involves the design of a subsystem for a high-speed processor. Extensive use of SPICE. Prerequisites: 271, 313, or consent of instructor. Recommended: knowledge of C and C-shells.
3 units, Spr (Horowitz)

372. Quantization and Data Compression—The theory and design of codes for quantization and signal compression systems (source coding systems), which convert analog or high bit rate digital signals to low bit rate signals while optimizing fidelity, subject to available communication and storage capacity. The theoretical and practical tradeoffs among bit rate, fidelity, and complexity in codes for quantization and compression. Topics: scalar quantization (PCM), transform and predictive codes, lossless (entropy) codes, vector quantizers designed using clustering and decision tree design algorithms, Bayes optimal prediction and classification, Shannon distortion-rate theory, and high rate (asymptotic) quantization theory. Prerequisites: 261, 278.
3 units, Spr (Gray) alternate years, not given 2001-02

3 units, Win (Widrow)

3 units, Spr (Widrow)

3 units, Win (Narasimha)

375. Advanced Analysis of Feedback—For advanced students. The required mathematics and basic results in the analysis of linear and nonlinear feedback systems. Nonlinear ODEs, local and global stability, Lyapunov theory. Gains of operators, small gain theorems, loop transformations, circle criteria, Popov theorem. Passive and contractive operators, Kalman-Yacubovich theorem. Robustness of multivariable linear systems, stability of feedback systems, linear systems with nonlinear actuators and sensors, overflow and quantizer induced limit cycles in digital filters. Prerequisite: 263.
3 units, Spr (Boyd) alternate years, not given 2001-02
376A. Information Theory—Information theory and statistics. The extreme points of communication theory: data compression to the entropy limit, and communication at the channel capacity limit. Kolmogorov complexity, Shannon entropy. Rate distortion theory. Huffman coding and random coding. Unified treatment based on the asymptotic equipartition theorem. Prerequisite: 278 or Statistics 116, or equivalent. 3 units, Win (Cover)

376B. Information Theory—Rate distortion theory and Kolmogorov complexity. Information theory and statistics. Stein’s Lemma. AEP. Information capacity of networks. Slepian-Wolf Theorem. Optimal investment and information theory. Maximum entropy and Burg’s Theorem. Prerequisite: 376A. 3 units, Spr (Cover) alternate years, not given 2001-02

377A. Dynamic Programming and Stochastic Control—(Enroll in Management Science and Engineering 351.)

377B. Neuro-Dynamic Programming and Reinforcement Learning—(Enroll Management Science and Engineering 339.)

379A. Digital Communication I—Maximum-likelihood data detection, modulation methods and bandwidth requirements, bandpass systems and analysis, intersymbol interference and equalization methods, diversity, phase-locking, and synchronization. Prerequisites: 103, 278. 3 units, Win (Cioffi)

379B. Digital Communication II—Capacity calculation, cut-off rates, Viterbi Detection, partial-response methods, convolutional codes, trellis and turbo codes, shaping codes, encoder/decoder complexity. Prerequisites: 278, 379A. 3 units, Spr (Cioffi) alternate years, not given 2001-02

379C. Advanced Digital Communication—Topics: transmit optimization for channels with intersymbol interference, combined equalization and coding, line coding design and analysis, discrete multitone (DMT), vector modulation, generalized DFE. 3 units, alternate years, given 2001-02

380. Seminar on Computer Systems—Current research in the design, implementation, analysis, and use of computer systems ranging from integrated circuits to operating systems and programming languages. (AU) 1 unit, Aut, Win, Spr (Allison, Wharton)

381A. Database System Implementation—(Enroll in Computer Science 346.)

381B. Transaction Processing and Distributed Databases—(Enroll in Computer Science 347.)

382. Processor Design—Cycle time, area tradeoffs, AT measures of arithmetic units, multiple issue processors, vector and multimedia extensions, shared memory multiprocessors, I/O systems. Design using queueing analysis. Prerequisite: 282 or equivalent. 3 units, given 2001-02

383. Advanced Compiling Techniques—(Enroll in Computer Science 243.)

384A. Internet Protocols and Standards—Local area networks protocols: MAC Addressing; IEEE 802.1 bridging protocols (trans-
388. Programming Language Design—(Enroll in Computer Science 342.)

390. Special Studies or Projects in Electrical Engineering—Independent work under the direction of a faculty member. Individual or team activities may involve lab experimentation, design of devices or systems, or directed reading.

391. Special Studies and Reports in Electrical Engineering—Independent work under the direction of a faculty member; written report or written examination required. Letter grade given on the basis of the report; if not appropriate, student should enroll in 390.

392. Special Seminars—Special seminars and experimental courses are given on topics of current interest by specialists in the field. Announcements are made one or two quarters prior to presentation. See Time Schedule and bulletins in department office for current listing.

392A Database System Principles—(Enroll in Computer Science 245.)

392B. Introduction to Image Sensors and Digital Cameras—Introduction to the design and analysis of image sensors and digital cameras. Analysis of the signal path in a digital camera starting from the optics, through the sensor, the A/D converter, to the different color processing steps. Topics: photodetectors; CCD and CMOS passive and active sensor operation; noise and FPN analysis; spatial resolution and MTF; SNR and dynamic range; A/D conversion approaches; color interpolation, correction, and balance; and autofocus. A MATLAB camera simulator is used to explore various tradeoffs in camera design. Prerequisites: undergraduate level device, circuit, and system background, e.g., equivalent to 102, 111, 112, and 113; and some familiarity with noise analysis.

3 units, Spr (El Gamal)

392J. Digital Video Processing—The fundamentals of digital video processing. Spatio-temporal sampling, motion analysis, motion-compensated filtering, and general video processing operations including noise reduction, restoration, superresolution, frame-rate conversion, deinterlacing, and compression (frame-based and object-based methods). Advanced topics: video segmentation, digital television, and video libraries and databases (MPEG-7). Prerequisite: 368A or 368B.

3 units, Win (Apostolopoulos, Wee)

392K. Genetic Algorithms and Genetic Programming—(Enroll in Computer Science 426.)

392L. Optical Fiber Communications Laboratory—Experimental techniques in optical fiber communications. Students investigate, experimentally, properties of key optical communications components: fibers, lasers, modulators, photodiodes, optical amplifiers, WDM multiplexers and demultiplexers, etc. Key optical communications systems techniques: eye diagrams and BER measurements. Prerequisites: 247, 348.

3 units, Spr (Kazovsky)

392M. Adaptive Communication Systems—Advanced communication design techniques for wireless and high-speed wireline applications. General and applied concepts in communication theory, concepts in digital communication receivers (adaptive antenna array and adaptive equalization). The practical aspects of advanced algorithms and systems for wireless digital communications of second and third generation: IS-136 and WCMDA. Discussion about ADSL and OFDM system. Skills and level of problem solving enables students to contribute effectively to research and development in this area. Prerequisites: one graduate course in signal processing, communication systems and probability. Recommended: exposure to simulation platforms, e.g., MATLAB and Simulink.

3 units, Win (Bahai)

392P. Constrained Coding—Introduction to the theory and practice of constrained coding. Descriptions of several applications where constrained coding has been used: magnetic tape drives, optical disk drives, holographic recording, and a wireless communications application. Develop formal properties of constrained systems, capacity and code rate, finite-state encoders, sliding-block decoders, culminating in the state-splitting code construction algorithm. Alternative models of encoding and code construction. Methods of integrating constrained codes with error-correction codes: concatenation with Reed-Solomon codes, reversed concatenation, turbo decoding, forbidden list codes and spectral null codes. Prerequisites: elementary probability, linear algebra. Recommended: error-correction coding, information theory.

3 units, Aut (Marcus)

392Q. Mobile and Wireless Networks and Applications—(Enroll in Computer Science 444N.)

395. Electrical Engineering Instruction: Practice Teaching—Open limited to number of advanced graduate students in Electrical Engineering who plan to make teaching their career. Qualified students conduct a small section of an established course taught in parallel by an experienced instructor.

1-15 units, Aut, Win, Spr (Gray)

399. Topics in Computer Vision—(Enroll in Computer Science 328.)

400. Thesis and Thesis Research—Limited to students who have established candidacy for the degree of Engineer or Ph.D. A grade of 'S' indicates satisfactory work; no letter grade is assigned.

by arrangement

402A. Seminar: Topics in International Technology Management—Internet access modes and electronic commerce in E. Asia. Implications of new wireless, optic fiber, TV cable, and other network infrastructures for Internet-based e-commerce in major E. Asian markets. Distinguished guests from industry and government. (AU)

1 unit, Aut (Dasher)

402S. Seminar: Topics in International Advanced Technology Research—Wafer-level packaging: international trends and challenges. Approaches and issues in vertical stacking, flip-chip CSP, surface mount assemblies, thin and thick film lamination, wafer thinning, thin-die functionality, interconnects, etc. Distinguished speakers from industry and government. (AU)

1 unit, Spr (Dasher)

410. Integrated Circuit Fabrication Laboratory—Preference to students pursuing doctoral research programs in which the facilities of the IC lab are used. Laboratory fabrication of silicon gate NMOS or CMOS integrated circuits. Emphasis is on the practical aspects of IC fabrication, including silicon wafer cleaning, photolithography, etching, oxidation, diffusion, ion implantation, chemical vapor deposition, physical sputtering and wafer testing. Prerequisites: 212, 216, consent of instructor.

3-4 units, Win (Saraswat)

414. Design of RF Integrated Circuits for Communications Systems—Students design, build, and test GHz transceivers using microstrip construction techniques and discrete components. The design, construction, and experimental characterization of representative transceiver building blocks: low noise amplifiers (LNAs), diode ring mixers, PLL-based frequency synthesizers, voltage-controlled oscillators (VCOs), power amplifiers (PAs), and microstrip patch antennas. The characteris-
453. Geomagnetically Trapped Radiation—Charged particle trapping in planetary magnetic fields, and its importance in near-earth-space phenomena. The motion of charged particles in inhomogeneous magnetic and electric fields, adiabatic invariants, distribution functions and diffusion equation methods. Useful theorems for interpreting experimental data. Source and loss processes and the physical mechanisms responsible for producing trapped radiation at the earth and other planets. Prerequisite: 142.

3 units, alternate years, given 2001-02

478. Blind Multichannel Identification and Equalization—Theory and algorithms for blind system identification and channel equalization. Applications to array signal processing, wireless communication, and medical and seismic signal processing.

3 units, alternate years, given 2001-02

479. Multiuser Digital Transmission Systems—Fundamental theoretical multiuser communications concepts (multiple access, broadcast, multiuser detection, crosstalk), matrix channel descriptions and optimized multiuser transmission, code-division multiple access concepts and implementations.

3 units, given 2001-02

3 units, alternate years, given 2001-02

3 units, Spr (Dally) alternate years, not given 2001-02

483. Topics in Compilers—(Enroll in Computer Science 343.)

484. Topics in Computer Graphics—(Enroll in Computer Science 448.)

486. Advanced Computer Arithmetic—Number systems, floating point representation, state of the art in arithmetic algorithms, problems in the design of high speed arithmetic units. Prerequisite: 282.

3 units, Win (Flynn) alternate years, not given 2001-02

487. Digital Signal Processing Architectures and Systems—The design and implementation of signal processing systems. Survey of the variety of architectures and the tools available to automate this task. Case studies in data communications, low power design, and video signal processing. Topics: DSP building blocks, hardware generation using silicon compilers, dedicated architectures, programmable architectures, architecture design tools, video compression, wireless communication, and low-power implementation. Prerequisites: 271, basic DSP concepts, C programming language, and UNIX.

3 units, Spr (Meng)

3 units, alternate years, given 2001-02

3 units, alternate years, given 2001-02

492. Special Seminars—Special seminars and experimental courses are given on topics of current interest by specialists in the field. Announcements are made one or two quarters prior to presentation. See the Time Schedule and bulletins in department office.

do by arrangement

MANAGEMENT SCIENCE AND ENGINEERING

Chair: M. Elisabeth Paté-Cornell

Deputy Chair: Peter W. Glynn

Associate Professors: Nicholas Bambos, Samuel S. Chiu, Ross D. Shachter, Edison T. S. Tse

Assistant Professors: Diane E. Bailey, Meiring de Villiers, Pamela J. Hinds, Benjamin Van Roy

Professors (Research): Walter Murray, Michael A. Saunders, John P. Weyant

Professor (Teaching): Robert E. McGinn

Associate Professor (Teaching): Thomas H. Byers

Consulting Professors: Hung-Po Chao, Naushad Forbes, Thomas Kosnik, James E. Matheson, Robert R. Maxfield, Peter A. Morris, D. Warner North, Richard D. Smallwood

Consulting Associate Professors: Adam Borison, Charles D. Feinstein, Samuel Holtzman, Gerd Infanger, Neil F. Kane, Laura Kopczak, Mike Lyons, Doug Mackenzie, Audrey MacLean, Behnarn Tabrizi, Adel Turki

Lecturers: Hill Huntington, Ferdo Ivanek, Robert A. Luenberger, Burke Robinson, Sam Savage

Visiting Professors: Olivier De La Grandville, Sy Goodman, Debra Meyerson

Visiting Associate Professor: Yee-Tien Pu

Director of the Industrial Affiliates Program: Sam L. Savage

Affiliated Faculty: David Beach, J. Michael Harrison, Charles A. Holloway, Kosuke Ishii, James G. March, David B. Montgomery, Evan L. Porteus, Krishna Saraswat
In December 1999, the Board of Trustees authorized the creation of the Department of Management Science and Engineering from the Department of Industrial Engineering and Engineering Management and the Department of Engineering-Economic Systems and Operations Research. The department's mission is: "to conduct research and provide education associated with the development of the knowledge, tools, and methods required to make decisions and shape policies, configure organizational structures, design engineering systems, and solve operational problems associated with the information-intensive, technology-based economy."

Management Science and Engineering (MS&E) provides exceptionally strong programs of education and research by integrating three basic strengths: (1) substantial depth in conceptual and analytical foundations, (2) comprehensive coverage of functional areas of application, and (3) vigorous interaction with other Stanford departments, with Silicon Valley industry, and with many organizations throughout the world. The analytical and conceptual foundations include optimization, dynamic systems, stochastic systems, economics, organizational science, and decision and risk analysis. These foundations support the functional areas and provide the basis for further advance in the discipline. The functional areas of application include finance, production, information, organizational behavior, marketing, entrepreneurship, policy, and strategy. Programs in these functional areas emphasize both fundamental concepts and practical applications. Close associations with other engineering departments and with industry enrich the programs by providing opportunities to apply MS&E methods to important problems and by motivating new theoretical developments from practical experience. MS&E's programs also provide a basis for contributing to other important areas such as biotechnology, defense policy, environmental policy, information systems, telecommunications, and other areas where mastery of fundamentals, functional knowledge, and an engineering viewpoint are extremely valuable.

CAREERS IN MS&E

MS&E helps students prepare for a variety of professional careers in business, government, industry, non-profit institutions, and universities. Graduates have pursued successful careers in consulting, enterprise management, financial analysis, government policy analysis, industrial research, line management, product development, project management, strategic planning, and university teaching and research. Some have founded companies specializing in financial services, high technology products, management and systems consulting, or software. Other graduates have helped establish new analytical capabilities in existing firms or government agencies.

Many graduates have become leaders in technology-based businesses, which have an increasing need for well-educated, analytically oriented people who understand both business and technology. The Department of MS&E is attractive to people with engineering, mathematical science, and physical science backgrounds as it complements their technical abilities with the conceptual frameworks needed to analyze problems of investment, management, marketing, operations, production, and strategic planning in a technical environment.

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

The program leading to the B.S. degree in Management Science and Engineering (MS&E) is stated under the "School of Engineering" section of this bulletin, and more information is contained in the School of Engineering's Handbook for Undergraduate Engineering Programs. Students are encouraged to plan their academic programs as early as possible, ideally in the freshman or sophomore year. Do not wait until you have declared a major to consult with the department's Student Services staff.

This curriculum provides students training in the fundamentals of engineering systems analysis to prepare them to plan, design, and implement complex economic and technological management systems. Graduates are prepared for work in a variety of career paths, including facilities and process management, investment banking, management consulting, or graduate study in industrial engineering, operations research, economics, public policy, medicine, law, or business.

The program builds on the foundation courses for engineering, including calculus, science, and engineering fundamentals, with courses in computer science, finance, mathematical modeling, organization theory, probability, statistics, and either information science or a senior group project. To develop depth in a particular area, students choose a concentration in either financial and decision engineering, industrial engineering/operations management, operations research, technology and organizations, or technology and policy.

Although the department offers a major in Industrial Engineering accredited by the Accreditation Board for Engineering and Technology (ABET), students are also free to choose majors with different concentrations or science courses.

The program builds on a strong engineering foundation. The required mathematics courses include calculus of single and multiple variables, linear algebra, probability, statistics, and stochastic models. (It is recommended that students take Statistics 110, although Statistics 190 is an option.) At least 14 units of science are required. For the ABET-certified degree program in Industrial Engineering, these must be physics and chemistry.

The program includes five Engineering Fundamental courses, technically rigorous introductory courses in various engineering disciplines. Engineering 60 introduces students to finance and decision analysis, Computer Science 106A is the first of two required computer science courses, and Engineering 40 provides some background and laboratory experience in electrical engineering. Although students can choose any two other engineering fundamentals, it is strongly recommended that they take Engineering 25, which presents the basic science and engineering principles of biotechnology.

The Technology in Society requirement is satisfied by a subset of the courses approved by the School of Engineering, particularly those that emphasize social responsibility. Some of these courses are also included in some of the concentrations, but in those cases the same course can only count toward one requirement.

The Writing in the Major (WIM) requirement can be met by four restricted electives in the program. It is up to the students to ensure that their programs include at least one of them, either in their concentrations or their Technology in Society courses.

The department core comprises courses in computer science, deterministic optimization, finance, organization theory, and either a senior project or a new course being developed in information science. Through the core, mathematics, engineering fundamental, and Technology in Society courses, all students in the program are exposed to the breadth of faculty interests, and are in a good position to choose a concentration during the junior year.

The following five concentrations are designed to allow a student to explore one area of the department in greater depth. Some of the courses require some prerequisites (Economics 1 or Psychology 1) not included in the degree program, but those courses could be used to satisfy the General Education Requirements (GERs).

1. Operations Management: focuses on the design and analysis of manufacturing, production and service systems. If all of the ABET requirements are met, then a student with this concentration who takes the project course can receive a degree in Industrial Engineering from the Department of Management Science and Engineering. These requirements include a particular set of science courses and minimum totals for units of "Engineering Science" and "Engineering Design" among the courses in the degree program.

2. Operations Research: provides a more mathematical program, based on algorithms, theory, and applications in economics and operations.

3. Technology and Policy: designed for students seeking a broad technological background coupled with policy analysis. It features courses in microeconomics, public policy, ethics or the law, and applications in national security and commercial technology policy.

4. Financial and Decision Engineering: focuses on the design and analysis of financial and strategic plans. It features accounting, decision
GRADUATE PROGRAMS

The faculty have developed graduate degrees in Management Science and Engineering (MS&E). The graduate degrees in EES&OR and IEEM will be phased out, and no new students will be admitted to those programs.

MS&E, in collaboration with other departments of the University, offers programs leading to the degrees of Master of Science and Doctor of Philosophy. The department also offers a coterminous B.S./M.S. degree, a master's degree in Manufacturing Systems Engineering in cooperation with the Department of Mechanical Engineering and a dual M.S./EE master's degree in cooperation with the Department of Electrical Engineering.

Applications for admission as graduate students in MS&E must submit the results of the verbal, quantitative, and analytical parts of the Graduate Record Examination. The deadline for application is February 1.

Except in unusual circumstances, admission is limited to the Autumn Quarter because courses are arranged sequentially with basic courses and prerequisites offered early in the academic year.

Assistantships and Fellowships—A limited number of fellowships and assistantships are awarded each year. Applicants admitted to the doctoral program, who have indicated on their application that they would like to be considered for financial aid, are automatically considered for these assistantships and fellowships.

Information about loan programs and need-based aid for U.S. citizens and Permanent Residents can be obtained from the Graduate Financial Support section of the Financial Aid Office.

MASTER OF SCIENCE

The M.S. degree programs require a minimum of 45 units beyond the equivalent of a B.S. degree at Stanford. All programs represent substantial progress in the major field beyond the bachelor's degree.

University requirements for the master's degree are described in the "Graduate Degrees" section of this bulletin.

MANAGEMENT SCIENCE AND ENGINEERING

The M.S. program in Management Science and Engineering (MS&E) prepares individuals for a life-long career addressing critical technical and managerial needs in private and public decision making. Department requirements for the M.S. degree provide breadth across some of the areas of the department, and flexibility for meeting individual objectives of depth in a particular area of concentration. The master's degree may be a terminal degree program with a professional focus, or a preparation for a more advanced graduate program. The M.S. degree can normally be earned in one academic year (three academic quarters) of full-time work, although students may choose to continue their education by taking additional MS&E courses beyond that year. Background requirements, taken in addition to degree requirements, must be met by students who have had insufficient course work in mathematical sciences, computer science, engineering and/or natural sciences.

Students must take a minimum of 45 course units as follows:
1. At least five core courses.
2. At least three other courses in an area of concentration of their choice.
3. A course in probability, unless a college-level course in probability has already been passed.
4. A project course requirement.
5. The remaining units in elective courses.

Background Requirements—Students must have had or must take the following (or equivalent) courses before the M.S. degree is conferred: Mathematics 41, 42, 51 (Calculus, 15 units), Computer Science 106A (programming, 5 units), and an additional 15 units of engineering, mathematical sciences, or natural sciences. These courses do not count toward the 45 units of the M.S. degree. These additional background requirements would typically be met by students who have a bachelor's degree in engineering, or mathematical or natural sciences. Students are notified at the time of admission of any remaining need to meet background requirements.

Core Courses—M.S. students must take at least five courses out of the following ten options:

- Dynamic Systems (MS&E 201) or Stochastic Decision Models (MS&E 251)
- Linear and Non-Linear Optimization (MS&E 211)
- Introduction to Stochastic Modeling (MS&E 221) or Simulation (MS&E 223)
- Economic Analysis (MS&E 241)
- Decision Analysis (MS&E 252), or Risk Analysis (MS&E 251A)
- Industrial Accounting (MS&E 140), Investment Science (MS&E 242), Financial Decisions (MS&E 245E), or Introduction to Finance (MS&E 245G)
- Production Systems (MS&E 261)
-Organizational Behavior and Management (MS&E 280)
- Marketing for Technology-Based companies (MS&E 279), or Global Entrepreneurial Marketing (MS&E 271)
- Strategy in Technology-Based Companies (MS&E 270)

Students may not waive core courses. They may, however, substitute an approved, more advanced course in the same area.

Courses in an Area of Concentration—Students must complete a departmentally approved set of three or more courses of 3 units or more in an area of concentration of one of the following types:
1. An area of concentration in the MS&E department.
2. An area of concentration in one of the seven other departments of the School of Engineering.
3. In exceptional cases, a coherent area of concentration designed by the student.

Project Course Requirement—Students must take either a designated project course or two designated integrated project courses.

Additional requirements are:
1. At least 27 units must be in courses numbered 200 and above in the MS&E, and at least 36 units must be in courses numbered 100 or above in MS&E or closely related fields. These courses and all core, concentration, and project course requirements must be taken for a letter grade.
2. The degree program must be completed with a grade point average (GPA) of 3.0 or higher.
3. Courses in athletics do not apply towards the degree.
4. All transfers of graduate-level units (a maximum of 9 units) and all course substitutions must have prior written approval in a Course Waiver/Transfer form.
5. A maximum of 18 Non-Degree Option (NDO) units can be applied toward the degree.

ENGINEERING: MANUFACTURING SYSTEMS ENGINEERING

The M.S. in Engineering with a concentration in Manufacturing Systems Engineering addresses the need for engineers who combine management and design skills focused on manufacturing. There is a critical need for individuals who can deal directly with product design for manufacturability; design of integrated manufacturing systems; financial, organizational, and strategic management issues; and elements of automation technology such as computer-aided design, computer-aided manufacturing, robotics, and microprocessor control.
Manufacturing Systems Engineering is a joint effort of the departments of Mechanical Engineering, and Management Science and Engineering. The program seeks highly qualified students with strong educational backgrounds in engineering and provides a demanding curriculum that is strong in both hardware and engineering management. Successful applicants should have a minimum of one year of full-time industrial experience.

The hardware and engineering-design aspects of the program include:

- Ambidextrous Thinking
- Design for Manufacturability
- Integrated Design for Marketability and Manufacturing
- Manufacturing and Design
- Microprocessor Applications
- Robotics and Manipulation
- Smart Product Design

The engineering management subjects include:

- Engineering Economy
- Industrial Accounting
- Inventory Control and Production Systems
- Management of New Product Development
- Manufacturing Strategy
- Manufacturing Systems Design
- Marketing for Technology-Based Companies
- Organizational Behavior and Management
- Supply
- Supply Chain Management

The hardware and engineering design courses provide hands-on training of these functions and the trade-offs that must be made in selecting alternative systems configurations.

The engineering management subjects provide a suitable perspective so that alternative system choices can be appropriately evaluated for their financial, organizational, and production impacts, as well as their impact on the firm’s manufacturing policy.

Beyond the required core, the curriculum allows for elective courses chosen from a broad set of relevant electives providing additional training in engineering management, engineering-design hardware, and aspects of computer science. A student may follow individual interests and tailor the program to meet individual needs.

Students interested in a career focused on manufacturing management and product development may apply for the Dual Manufacturing Systems Engineering and the M.B.A. program. Minimum requirements can be met through six to seven quarters of study if the candidate matriculates in both Engineering and the M.B.A. program. Minimum requirements can be met so that alternative system choices can be appropriately evaluated for their financial, organizational, and production impacts, as well as their impact on the firm’s manufacturing policy.

Beyond the required core, the curriculum allows for elective courses chosen from a broad set of relevant electives providing additional training in engineering management, engineering-design hardware, and aspects of computer science. A student may follow individual interests and tailor the program to meet individual needs.

Students interested in a career focused on manufacturing management and product development may apply for the Dual Manufacturing Systems Engineering and the M.B.A. program. Minimum requirements can be met through six to seven quarters of study if the candidate matriculates in both programs simultaneously.

The detailed requirements for the M.S. in Manufacturing Systems Engineering are available from the MS&E Student Services office.

MANAGEMENT SCIENCE AND ENGINEERING (MS&E) AND ELECTRICAL ENGINEERING (EE)

Admission—For the dual degree, admission to both departments is required, but is coordinated by designated members of both Admissions Committees who make recommendations to the committees of their respective departments.

Advising—Every student in the dual degree program has one adviser in EE, and one in MS&E. In addition, a committee consisting of designated faculty from both departments serves as a review committee on performance and as an overseeing body of ongoing and graduating students of the program. The committee, consisting of designated members of both Admission Committees as described in the previous section, may initially serve as this overseeing body.

The Dual Degree Program—This dual-degree program enables a small, selective set of graduate students to obtain both the MS&E master’s degree and the EE master’s degree simultaneously. Students complete the course requirements for each department. However, the total number of units required to complete the dual-degree is 72 (versus 90 if the two degrees were pursued separately), and the total number of full-time quarter residency equivalents required to complete the dual degree is six (students with a 50 percent teaching or research assistantship, who average 9 units per quarter, earn .62 of a full quarter of residence).

PROFESSIONAL EDUCATION

The Stanford Center for Professional Development (SCPD) provides opportunities for employees of some local and remote companies to take courses at Stanford.

The Honors Cooperative Program (HCP) provides opportunities for employees of some local companies to earn a M.S. degree over a longer period, by taking one or two courses per academic quarter. Some required courses are only offered on campus; HCP students must plan to attend those courses at Stanford to meet the degree requirements. It is not currently possible to complete this program as a remote HCP student. Students must apply for a degree program through the standard application process, and must meet the standard application deadline of February 1.

The Non-Degree Option (NDO) allows employees of some local companies to take courses for credit from their company sites before being admitted to a degree program. Students apply to take NDO courses each quarter through the Stanford Center for Professional Development.

For additional information about the NDO application process and deadlines, see http://scpd.stanford.edu, or contact the SCPD at (650) 725-3000.

The department offers a Certificate Program within the framework of the NDO program. A certificate in one of several specialties can be obtained by completing three core courses, plus one MS&E elective course for the total of four courses. For further information, see: http://scpd.stanford.edu/ce/ndp/certificate.html.

DOCTOR OF PHILOSOPHY

University requirements for the Ph.D. degree are described in the “Graduate Degrees” section of this bulletin.

The Ph.D. degree in MS&E is intended for students primarily interested in a career of research and teaching, or high-level technical work in universities, industry or government. The program requires three years of full-time graduate study, at least two years of which must be at Stanford University. Typically, however, students take about four to five years after entering the program to complete all Ph.D. requirements. The Ph.D. is generally organized around the requirement that the students acquire a certain breadth across some of the eight areas of the department, and depth in one of them. These areas are:

- Decision analysis and risk analysis
- Economics and finance
- Information science and technology
- Organization, technology, and entrepreneurship
- Policy and strategy
- Probability and stochastic systems
- Production operations and management
- Systems modeling and optimization

Doctoral students are required to take a number of courses, both to pass a qualifying exam in one of these areas and to complete a dissertation based on research which must make an original contribution to knowledge.

Each student admitted to the Ph.D. program must satisfy a breadth requirement and pass a qualification procedure. The purpose of the qualification procedure is to assess the student’s command of the field and to evaluate his or her potential to complete a high-quality dissertation in a timely manner. The student must complete specified course work in one of the eight areas of the department. The qualification decision is based on the student’s grade point average (GPA), on the one or two preliminary papers prepared by the student, and on the student’s performance in an area examination. Considering this evidence, the department faculty votes on advancing the student to candidacy in the department at large. The Ph.D. requires a minimum of 72 units, at least 54 of which must be in courses of 3 units or more. At least 48 course units in courses of 3 units or more must be taken for a letter grade. Finally, the student must pass a University oral examination and complete a Ph.D. dissertation. During the course of the Ph.D. program, students who do not have a master’s degree are strongly encouraged to complete one, either in MS&E or in another Stanford department.
Breadth Requirement—

1. The breadth requirement is to be satisfied by a choice of four courses spanning four out of the above mentioned eight areas of the department. The list of courses satisfying the breadth requirement is available from the MS&E Student Services office.
2. The Ph.D. candidacy form must contain four courses that satisfy the breadth requirement.
3. Courses chosen to satisfy the breadth requirement must be taken for letter grades.
4. At least one of the four courses chosen to satisfy the breadth requirement must be at the 300 level.

Qualification Procedure Requirements—The qualification procedure is based on breadth across the department’s disciplines and depth in an area of the student’s choice. The qualification process must be completed by the end of the month of May of the student’s second year of graduate study in the department. The performance of all doctoral students is reviewed every year at a department faculty meeting at the end of May or beginning of June. Ph.D. qualification decisions are made at that time and individual feedback is provided.

The Ph.D. qualification requirements comprise three elements:

1. Grade Point Average: a student must maintain a GPA of at least 3.4 in the four courses chosen to satisfy the breadth requirements, and a GPA of at least 3.4 in the set of all courses taken by the student within the department. In both cases, the GPA is computed on the basis of the nominal number of units for which each course is offered.
2. Paper(s): a student may choose between two options, either to be completed before the Spring Quarter of the student’s second year. The first option involves one paper supervised by a primary faculty adviser in one area and a faculty consultant in another area. The objective is to permit a student who has decided on a principal thesis focus to concentrate early in that area while benefiting from the input (and broadening) afforded by the participation of a faculty member outside the primary area of research. This paper should be written in two quarters.
   - The second option involves two shorter sequential tutorials in two different areas, with two different faculty advisers. Each tutorial should be completed in one quarter. In both options, the student chooses the faculty adviser(s)/consultant with the faculty members’ consent.
   - A student may register for up to three per tutorial and up to 6 units for a paper. These paper or tutorial units do not count towards the 54 course units required for the Ph.D., and letter grades are not given.
3. Area Qualification: in addition, during the second year, a student must pass an examination in an area of his or her choice, either in one of the eight department areas already defined by the faculty, or in a ninth area representing a mix of area specialties to be defined by a cognizant faculty group (including at least three faculty members) appointed by the department chair. This area examination is written, oral, or both at the discretion of the area faculty administering the exam.
4. Area Course Requirement: students must complete the depth requirements of one of the eight areas of the MS&E department. The Ph.D. requirements for the eight areas of the MS&E department are available from the MS&E Student Services office.

COURSES

(AY) indicates that the course is subject to the University Activity Unit limitations (8 units maximum).
(WIM) indicates that the course meets the Writing in the Major requirements.

UNDERGRADUATE

60. Engineering Economy—(Enroll in Engineering 60.)
   3 units, Aut (Jacker)
   Win, Sum (Staff)

101. Undergraduate Directed Study—(Formerly IE 191.) Directed study on a subject of mutual interest to the student and faculty member.
   Student must find a faculty sponsor and submit a one-page description of plan.
   1 or more units (Staff)

107. Interactive Management Science—(Formerly EES&OR 137; graduate students register for 207.) Examines analytical techniques such as linear and integer programming, Monte Carlo simulation, forecasting, decision analysis, and Markov chains in the environment of the spreadsheet. Materials include spreadsheet add-ins for implementing these and other techniques. Emphasis is on building intuition through interactive modeling, and extending the applicability of this type of analysis through integration with existing business data structures. Project required of those enrolled in 207.
   3 units, Aut, Sum (Savage)

108. Senior Project—(Formerly IE 180.) Restricted to IE majors in their senior year. Students participate in a major project in groups of four. Problem identification and definition, emphasizing data collection, synthesizing feasible solutions to real problems, and presentation of results. Prerequisites: 121, 140, 164, 169, 180, 245, 260; Computer Science 106B or X; Engineering 40, 62.
   5 units, Win (Staff)

111. Introduction to Optimization—(Formerly EES&OR 111; enroll in Engineering 62.)
   4 units, Aut (Cottle)
   Spr (Veinott)

120. Probabilistic Analysis—(Formerly EES&OR 120.) Probabilistic concepts important to rigorous problem solving, focusing on model building and communication: the structuring, processing, and presentation of probabilistic information. Probabilistic information using axiomatic principles. Life examples provide motivation and illustrations of modeling techniques for probabilistic situations. Standard spreadsheet use provides probabilistic insights (and solution capability) to complement analytical closed form solutions. Topics: introductory probability (tools and concepts, e.g., the axioms of probability theory, random variables, distributions, the concept of conditioning, expectation and limit theorems, etc.). Materials from legal, social, medical, physical, and daily encountered problems. Prerequisites: 120 or Statistics 116.
   4 units, Spr (Glynn)

121. Introduction to Stochastic Modeling—(Formerly EES&OR 121.) Stochastic processes and models in operations research. Discrete and continuous time parameter Markov chains. Queuing theory, inventory theory, simulation. Prerequisite: 120 or Statistics 116.
   4 units, Spr (Veinott)

122. The Flaw of Averages—(Formerly EES&OR 21.) A common cause of bad planning is the flaw of averages. This error occurs whenever an uncertain quantity is represented by a single average number. Examples of the flaw of averages may be obvious or insidious. The information age is changing our perspective of uncertainty. Seminar is designed to recognize the flaw of averages, avoid it in everyday thinking, introduce recent information technologies for preventing the flaw of averages, and relate this new approach of dealing with uncertainty to traditional statistics.
   2 units, Aut (Savage)

130. Information Systems—(Formerly IE 175.) Introduction to the design and use of computer-based information systems. Topics: software and hardware used in information systems, information requirements, database design, information system design, organizational aspects of information systems, and applications of information systems in different industries. Prerequisites: 180; Computer Science 106A, 106B.
   4 units, Win (Staff)

170
131. Information Science—Information science is presented in terms of five essential aspects of information (five E's): Information as entropy is the classical information theory concerning bits and bytes, channel capacity, bandwidth, coding, and encryption. Information as an economic commodity, unlike other commodities information generally, is not lost when it is consumed, and this has important consequences for how information is efficiently produced, priced, and distributed. Information as enlightening, where information can influence decisions made, and for this purpose has a value that can be calculated. Information as embodied in physical form, where vast quantities of information are stored in data bases and data warehouses, and transmitted through networks that package, encrypt, switch, and route it from location to location. Information as extracted from data, using data-mining and modeling techniques. Modern instances of these five information concepts. 

3 units, Win (Luenberger)

140. Industrial Accounting—(Formerly IE 133.) Non-majors and minors who have taken or are taking elementary accounting should not enroll. Introduction to accounting concepts and the operating characteristics of accounting systems. The principles of financial and cost accounting, design of accounting systems, techniques of analysis, and cost control. Designed for the use of accounting information and not as an introduction to a professional accounting career. Interpretation and use of accounting information for decision making is stressed. 

3-4 units, Aut, Sun (Staff)

141. Financial Literacy—(Formerly EES&OR 41.) Practical knowledge about personal finance and money management including budgeting, credit cards, banking, insurance, taxes, and saving. Real-life credit card bills, bank statements, paycheck stubs, and insurance policies. 

1 unit, Win, Spr (Morrison)

152. Introduction to Decision Analysis—(Formerly EES&OR 152.) How to make good decisions in a complex, dynamic, and uncertain world. People often make decisions that on close examination they regard as wrong. Decision analysis uses a structured conversation based on actional thought to obtain clarity of action in a wide variety of domains. Topics: distinctions, possibilities and probabilities, relevance, value of information and experimentation, relevance and decision diagrams, risk attitude. (WIM) 

4 units, Spr (Shachter)

160. Analysis of Production and Operating Systems—(Formerly IE 260.) Graduate students register for 260; see 260. 

4 units, Aut (Staff)

164. Manufacturing Systems Design—(Formerly IE 125; graduate students see 264.) The concepts and techniques of designing and improving productive systems. Emphasis is on the physical and organizational design of high-performance manufacturing systems. Multidisciplinary approach with the use of digital simulation as a tool for evaluating design alternatives. Prerequisites: 121, 169, 180. (WIM) 

5 units, Spr (Bailey)

169. Quality Assurance and Control—(Formerly IE 121.) Introduction to the concepts and statistical methods that companies use to manage and improve quality. Topics: sampling inspection, statistical process control, quality function deployment, cost of quality, and Taguchi's method for designing in quality. Prerequisites: 120 or Statistics 116, and Statistics 110 or 190. 

4 units, Win (Staff)

180. Organizations: Theory and Management—(Formerly IE 100.) For undergraduates only, with preference to IEEM and MS&E majors. Survey of classical and modern organization theory, covering the behavior of the individual, the work group, and the organization. 

4 units, Aut (Staff) Spr (Hinds)

181. Issues in Technology and Work for a Post-Industrial Economy—(Formerly IE 101.) Introduces undergraduates in industrial engineering and other engineering disciplines to the study of technology and work, exploring topics of contemporary concern and identifying challenges posed by a post-industrial workplace. Objectives: explore how changes in technology and organization are altering the way we work and live our lives; become acquainted with approaches to studying and designing work; and examine how a grounded understanding of work and work practices can assist engineers in designing better technologies and organizations. Representative topics: job design, distributed and virtual organizations, the blurring of boundaries between work and family life, computer supported cooperative work, trends in skill requirements and occupational structures, monitoring and surveillance in the workplace, downsizing and its effects on work systems, project work and project based lifestyles, the growth of contingent employment, telecommuting, electronic commerce, and the changing nature of labor relations. 

3 units (Barley) given 2001-02

182. Work, Technology, and Society—(Formerly IE 170; fulfills the School of Engineering's Technology in Society requirement.) Seminar on work in contemporary society as influenced by rapid technological change. Causes and consequences of the current revolution in work, and policies for grappling with resultant problems. Focus is on the U.S., with attention to key trends in selected foreign countries. Topics: new technology in the workplace and its bearing on occupational and organizational changes, employer-employee relations, worker health and safety, economic competitiveness, women workers, workplace ethics, and the future of work. Limited enrollment. 

4 units (McGinn) given 2001-02

192Q, Stanford Introductory Seminar: International Environmental Policy—Preference to sophomores. Introduction to the science, using economics and the politics of international environmental policy. Current negotiations on global climate change are a case study. Lectures/materials are self-contained and similar to material the instructor used in briefing international negotiations and the U.S. Congress, integrating the material more comprehensively in policy briefings on individuals, dimensions, or the problem and its potential solutions. 

4 units, Aut (Weyant)

193. Technology in National Security—(Formerly EES&OR 193; graduate students register for 293.) Examines critical decisions made by the U.S. in selected security and space programs, emphasizing current issues. Case studies illustrate the process by which technical, political, and economic issues are brought into the policy process; particularly, the way in which technical organizations in government, government committees, and science advisory boards interact to bring advice to senior policy makers. Some case decisions in other countries. (WIM) 

3 units, Aut (Perry)

194. The Role of Analysis in Environmental Policy Decisions—(Formerly EES&OR 194; graduate students register for 294.) Examines major past and current public policy decisions on issues such as air pollution, toxic chemicals, nuclear waste, and global climate alteration. Case studies from the instructors' personal experience illustrate the process by which technical, political, and economic factors are brought into the policy process. Emphasis is on the role of analysis in summarizing technical information and uncertainties and on the reconciliation of differing points of view among government experts, scientific advisory boards, and interested/affected parties among the public. Recommended: background in quantitative analysis (i.e., basic undergraduate courses in engineering, science, or economics). 

3-5 units, Spr (North)

195. International Security in a Changing World—(Formerly EES&OR 195; same as Political Science 138.) Surveys the major international and regional security problems in the modern world. Interdisciplinary faculty lecture on the political and technical issues
involved in arms control, the military legacy of the Cold War, regional security conflicts, proliferation of advanced weapons capabilities, ethnic conflicts, and peacekeeping efforts. GER:3B (DR:9)
5 units, Win (Blacker, Perry, May, Sagan)

196. Transportation Systems and Urban Development—(Formerly EES&OR 196.) Introduction to transportation systems and planning, and their roles in society. Analytical tools introduced at a conceptual level examine issues and evaluate alternatives. Policy implications and system effectiveness analysis of transportation in an urban context. Topics: economic analysis of transportation, supply and demand equilibrium analysis, urban transportation networks, congestion management, short and long term transportation planning, the impact of technology on transportation systems, land use and transportation, case studies and analysis of current transportation news items. Prerequisite: Mathematics 21.
3 units (Staff) not given 2000-01

197. Ethics and Public Policy—Ethical issues in science- and technology-related public policy conflicts. Develops the capacity for rigorous critical analysis of complex, value-laden policy disputes. Topics: the nature of ethics and morality; the natures of and rationales for liberty, justice, and human rights; and the use and abuse of these concepts in recent and current policy disputes. Cases from: biomedicine, environmental affairs, the technical professions, communications, and international relations. GER:3a (DR:8) (WIM)
5 units, Win (McGinn)

PRIMARILY FOR GRADUATE STUDENTS

GENERAL AND SYSTEMS ANALYSIS METHODS

201. Dynamic Systems—(Formerly EES&OR 231.) Introductory; the goal is to train students to think dynamically in decision making, and recognize and analyze dynamic phenomena in diverse situations. Concepts: formulation and analysis; state-space formulation; solutions of linear dynamic systems, equilibria, dynamic diagrams; eigenvalues and eigenvectors of linear systems, the concept of feedback; nonlinear dynamics, phase plane analysis, linearized analysis, Liapunov functions, catastrophe theory. Examples: grabber-holder dynamics, technology innovation dynamics, creation of new game dynamics in business competition, ecosystem dynamics, social dynamics and stochastic exchange dynamics. Prerequisite: Mathematics 103 or equivalent.
4 units, Win (Tse)

207. Interactive Management Science—(Formerly EES&OR 237; undergraduates register for 107.) Examines analytical techniques, e.g., linear and integer programming, Monte Carlo simulation, forecasting, decision analysis, and Markov chains in the environment of the spreadsheet. Spreadsheet add-ins for implementing these and other techniques. Emphasis is on building intuition through interactive modeling, and extending the applicability of this type of analysis through integration with existing business data structures. Project.
3 units, Aut, Sum (Savage)

208. Practical Training—(Formerly EES&OR 208.) Students obtain employment in a relevant industrial or research activity, chosen to enhance their professional experience, and consistent with the degree program they are pursuing. Prerequisite: consent of instructor.
1 unit, Aut, Win, Spr, Sum (Savage)

OPTIMIZATION

4 units, Aut (Staff)

3 units, Aut (Eaves)

PROBABILITY AND STOCHASTIC SYSTEMS

220. Probabilistic Analysis—(Formerly EES&OR 221.) Concepts and tools for the analysis of problems under uncertainty, focusing on model building and communication: the structuring, processing, and presentation of probabilistic information. Examples from legal, social, medical, and physical problems provide motivation and illustrations of modeling techniques. Spreadsheets illustrate and solve problems as a complement to analytical closed-form solutions. Topics: axioms of probability, random variables, distributions, conditioning, expectation inference, and limit theorems. Prerequisite: Mathematics 51.
4 units, Aut (Shachter)

221. Stochastic Modeling—(Formerly EES&OR 222.) Continuation of 220. Topics: limit theorems, discrete and continuous time Markov chains, renewal processes, queuing theory, and transform analysis. Emphasis is on building a framework to formulate and analyze probabilistic systems. Prerequisite: 220 or Statistics 217.
3 units, Win (Glynn)

223. Simulation—(Formerly EES&OR 232.) Generation of uniform and non-uniform random numbers, discrete-event simulations, simulation languages, design of simulations, statistical analysis of the output of simulations, variance reduction, optimization via simulation, applications to modeling stochastic systems in computer science, engineering, finance, and operations research. Prerequisites: a working knowledge of FORTRAN, PASCAL, C, or C++; probability at the level of 120 or Statistics 116.
3 units, Spr (Staff)

224. Stochastic Models in Operations Research—(Formerly EES&OR 273.) Formulation and analysis of models in operations research involving stochastic processes. Topics: Markovian queues, queues with embedded Markov chains, general single server queue, queuing networks, diffusion approximations, queues in heavy traffic. Prerequisites: 221, 251, or equivalent.
3 units (Staff) not given 2000-01

INFORMATION SCIENCE AND TECHNOLOGY

230. Introduction to Computer Networks—(Enroll in Electrical Engineering 284.)
3 units, Aut (Tobagi)

232. Information Technology and Supply Chain Management—(Formerly IE 267; same as Business T372.) Advancements in information technologies have enabled major innovations in the re-engineering of industry supply chains, redefining the ways companies operate their supply chains. New ventures have emerged to create values for business partners and the consumers in supply chain integration. How information technologies have advanced supply chain integration and coordination. The dimensions of business and process improvements. New opportunities using supply chain management concepts and emerging technologies. Enrollment limited.
4 units, Spr (Lee, Whang)
234. Organizations and Information Systems—(Formerly IE 275.)
For graduate students interested in how information systems impact organizations and how organizations take control of information technology (IT) to gain a competitive edge. Topics: IT strategy, the fit between IT and corporate culture, IT architectural alternatives, changing technologies and organizational learning, the effect of IT on competition, and outsourcing as an offensive strategy. Student teams perform field studies based on situations in which information technology is creating a significant management problem or business opportunity. Case based. Enrollment limited. Prerequisites: 180 or 280, consent of instructor.
4 units, Spr (Tabrizi)

236. Pricing Next Generation Telecommunications Products and Services—(Formerly EES&OR 286.) Telecommunication products and services pricing as the key to success in a rapidly changing and highly competitive market. Interdisciplinary approach to position, price, and distribution of traditional/innovative telecommunication services. Topics: the telecommunication industry as driven by technological advancements, policy choices, and explosive business opportunities; the pricing revolution and arbitrage opportunities in international voice created by data-voice convergence and liberalization; competitive aspects of service delivery channels; commoditizing of bandwidth and basic services; clearinghouses; financial risk hedging through futures/derivatives trading; the need to develop intelligent pricing and provisioning agents for product bundling; grade of service differentiation; positioning and revenue optimization by capturing consumer preferences. Group project in industrial participation.
3 units, Sum (Chiu)

237. Progress in Worldwide Telecommunications—(Formerly EES&OR 297.) Interdisciplinary study of topics in current worldwide developments and economic trends with the participation of prominent guest speakers from telecommunications organizations and industry. Topics: telecommunications services and networks, (de)regulation and market-driven competition, technology, standardization, international organizations, and the needs of the underserved parts of the world. Individual or team case study and a verbal presentation. May be repeated for credit.
3 units, Sum (Ivanek, Chiu)

ECONOMICS, FINANCE, AND INVESTMENT

241. Economic Analysis—(Formerly EES&OR 241.) Principal methods of the economic analysis of the production activities of firms (production technologies, cost and profit; perfect and imperfect competition); individual choice (preferences and demand); and the market-based system (price formation, efficiency, welfare.) Emphasis is on the analytical foundations and the practical applications of the methods presented. See 341 for continuation of 241. Recommended: 211.
4 units, Win (DeVilliers)

242. Investment Science—(Formerly EES&OR 242.) Introduction to modern quantitative investment analysis: theory and practical application. How modern investment concepts can be used to evaluate and manage opportunities; structure portfolios; and use sophisticated investment products including stocks, bonds, mortgages, and annuities. Topics: deterministic cash flows (time-value of money, present value, internal rate of return, term structure of interest rates, bond portfolio immunization, project optimization); mean-variance theory (Markowitz model, capital asset pricing); dynamic and uncertain cash flows. Emphasis is on translating theory into actual procedures. Examples of applications for every major topic. Group project devoted to application of the theory. See 342 for continuation of 242.
3 units, Aut (Chiu)
Sum (Feinstein)

245G. Introduction to Finance—(Formerly IE 236; same as Business F221.) The foundations of finance, with applications in corporate finance and investment management. The process of valuation, which is central to many of the major financial decisions made by corporate managers and investors. Topics: criteria for making investment decisions, relationships between risk and return, market efficiency, and the valuation of derivative securities (e.g., options). The major financial instruments issued by corporations including short and long term debt, equity, and convertible securities. Conceptually rigorous; cases illustrate applications of the main concepts. Prerequisites: 120 or Statistics 116; 140 and Engineering 60. Recommended: Engineering 62; Statistics 110 or 190.
4 units, Win (Admiral)

247E. International Investment and Financing—(Formerly IE 237.) Builds on the concepts in 235, e.g., NPV, capital structure, and cost of capital estimation, and extends these concepts to an international setting where foreign exchange plays a key role. Topics: exchange rate determination theories, the performance of exchange forecasting models, exchange rate exposure and hedging, international borrowing and capital structure, and international project evaluation. Practical standpoint; however, an understanding of the theory is a necessity in "real world" applications. Prerequisite: 245.
3-4 units, Spr (Staff)

247S. International Investments—(Formerly EES&OR 243.) Introduces international financial markets, their comparative behavior, and their interrelations. Focus is on the assets traded in liquid markets: currencies, equities, bonds, swaps, and derivatives. Topics: institutional arrangements, taxation and regulation, international arbitrage and parity conditions, valuation of target firms for cross-border acquisitions, international diversification and portfolio management, derivative instruments and dynamic investment strategies, international performance analysis, international capital flows and financial crises, and topics of current relevance and importance. Corequisite: basic finance theory (equivalent of 242 or 245).
3 units, Sum (Fu)

248. Economics of Natural Resources—(Formerly EES&OR 246.) Intertemporal economic analysis of natural resource use, particularly energy, and including air, water, and other depletable mineral and biological resources. Emphasis is on an integrating theory for depletable and renewable resources. Stock-flow relationships; optimal choices over time; short- and long-run equilibrium conditions; depletion/extinction conditions; market failure mechanisms (common-property, public goods, discount rate distortions, rule-of-capture); policy options. Prerequisite: 241 or Economics 51.
4 units (Sweeney) not given 2000-01

249. Growth and Development—(Formerly EES&OR 249.) How to assess new investment opportunities in the countries of the Pacific Rim and other fast growing economies. Useful for investors and those guiding their country's development choices. Topics: the mechanism of economic growth, the equation of interest, optimal growth, economic interpretation of the calculus of variations and optimal control theory results, uncertainty, tools for evaluating long-term growth rate, geometric moments, and exponential distribution. Investment incentives, country risk indices. The long view: rule of law vs. rule of people. Practical cases from Ireland, E. European countries, China, and other E. Asian countries.
3 units, Sum (de La Grandville)

DECISION AND RISK ANALYSIS

250A. Engineering Risk Analysis—(Formerly IE 240.) The techniques of analysis of engineering systems for risk management decisions involv-
ing trade-offs (technical, humans, environmental aspects). Four parts: elements of decision analysis; probabilistic risk analysis (fault trees, event trees, etc.); economic analysis of failure consequences (issues of human safety and long-term economic discounting); and case studies (e.g., space, systems, nuclear power plants, liquefied natural gas terminals, and dams). Emphasis is on risk management issues in the public and private sectors. Prerequisites: 120 or Statistics 116, and Engineering 60, or equivalents.

3 units, Win (Paté-Cornell)

250B. Project Course in Engineering Risk Analysis—(Formerly IE 241.) Students, individually or in groups, choose, define, formulate, and resolve a real risk management problem, preferably from a local firm or institution. Oral presentation and report required. Scope of the project is adapted to the number of students involved. Three phases: risk assessment, communication, and management. Emphasis is on the use of probability for the treatment of uncertainties and sensitivity to problem boundaries. Enrollment limited, consent of instructor. Prerequisite: 250A.

3 units, Spr (Paté-Cornell)

251. Stochastic Decision Models—(Formerly EES&OR 251.) Efficient formulation and computational solution of sequential decision problems under uncertainty. Markov decision chains and stochastic programming. Maximum expected present value and rate of return. Optimality of simple policies: myopic, linear, index, acceptance limit, and (s,S). Optimal stationary and periodic infinite-horizon policies. Applications to investment, options, overbooking, inventory, production, purchasing, selling, quality, repair, sequencing, queues, capacity, transportation. MATLAB is used. Prerequisites: probability, linear programming.

3 units, Win (Veinott)

252. Decision Analysis I—(Formerly EES&OR 252.) Coherent approach to decision making, using the metaphor of developing a structured conversation having desirable properties, and producing actional thought that leads to clarity of action. Instruction is Socratic, with computational issues covered in problem sessions. Emphasis is on creation of distinctions, representation of uncertainty by probability, development of alternatives, specification of preference, and the role of these elements in creating a normative approach to decisions. Evaluates information-gathering opportunities in terms of a value measure. Relevance and decision diagrams represent and clarify inference and decision. Principles are applied to decisions in business, technology, law, and medicine. See 352 for continuation.

4 units, Aut (Howard)

254. The Ethical Analyst—(Formerly EES&OR 254.) The professional analyst who uses technical knowledge in support of any individual, organization, or government is ethically responsible for the consequences. Students are sensitized to ethical issues, providing the means to form ethical judgments, questioning the desirability of physical coercion and deception as a means to reach any end. Exploration of human action and relation in society is conducted in the light of previous thought, and is used to provoke additional research on the desired form of social interactions. Attitudes toward ethical dilemmas are explored by creating an explicit personal code. Issues from the range of human affairs test the student’s framework for ethical judgment.

1-4 units, Spr (Howard)

PRODUCTION OPERATIONS, SERVICES, AND MANUFACTURING

260. Analysis of Production and Operating Systems—(Formerly IE 260, undergraduate students register for 160.) Introduction to the design, operation, and control of production systems using mathematical, computational, and modern analytical techniques. Topics: determination of optimal facility location, determination of production lot sizes, optimal timing and sizing of production capacity expansion, and introduction to inventory control. Prerequisites: 120 or Statistics 116, and Engineering 62.

4 units, Aut (Staff)

261. Inventory Control and Production Systems—(Formerly IE 261.) Topics in the planning and control of manufacturing systems. The functions of inventory, determination of order quantities and safety stocks, alternative inventory replenishment systems, item forecasting, production-inventory systems, materials requirements planning (MRP), just-in-time systems, master and operations scheduling, supply chain management, and service operations. Enrollment limited. Prerequisite: 120 or Statistics 116 or equivalent.

3 units, Win (Hausman)

262. Supply Chain Management—(Formerly IE 262.) Definition of a supply chain, coordination difficulties, pitfalls and opportunities in supply chain management, inventory-service tradeoffs, performance measurement and incentives. Supply chain network design, global supply chain management, the manufacturing/distribution interface, supplier management. Design and redesign of products and processes for supply chain management, tools for design, industrial applications, strategic alliances, current industry initiatives. Enrollment limited to 50 MS&E students. Prerequisite: 260 or 261.

3 units, Spr (Hausman)

263. Service Operations Management—(Formerly IE 263.) Operations management in the service industries (e.g., banking, transportation, travel and tourism, health, government) and within service functions of manufacturing (e.g., financing, customer service). Topics: design and delivery of services, the measurement of productivity and quality, managing capacity and demand, quality management, reengineering of service delivery processes, management of technology in services, and managing human resources. Prerequisite: 120 or Statistics 116. Recommended: Engineering 62.

3 units, Spr (Brandeau)

264. Manufacturing Systems Design—(Formerly IE 225; undergraduates see 125.) The concepts and techniques useful in the initial design and redesign of modern, high-performance manufacturing systems. Multidisciplinary approach considers the design of the physical and organizational aspects of manufacturing systems. Emphasis is on the use of simulation as a tool for design evaluation. Prerequisite: graduate standing in engineering.

4 units, Aut (Jucker)

265. Reengineering the Manufacturing Function—(Formerly IE 265.) Preference given to undergraduates. Student teams of four to six redesign the manufacturing and distribution system of a medium-sized manufacturer, focusing on the transportation system, inventory policies for a regional warehouse, design of a national distribution system, operational improvements of work flow, layout of the manufacturing plant, and redesign of the planning and control system. Redesign is at an operational level consistent with a strategy of integrating the functions of manufacturing and distribution. Modular approach, with each module requiring analytical or game software. Data is provided. Groups meet twice per module with faculty; written report required. Topics: production planning, inventory theory, linear/integer programming, economic analysis, and applied probability. Modules are integrated via the focus on the customer; group learning is emphasized. Enrollment limited. Prerequisite: senior or graduate standing, 160; Engineering 60 and 62.

4 units (Carlson) alternate years, given 2001-02

266. Management of New Product Development—(Formerly IE 266.) Techniques of managing or leading the process of new product development that have been found effective. Emphasis is placed on how much control is desirable and how that control can be exercised in a setting where creativity has traditionally played a larger role than discipline. Topics: design for manufacturability, assessing the market, imposing discipline on the new product development process, creating an effective development organization, and developing products to hit cost targets.

4 units, Win (Carlson)
Decisions in entrepreneurial settings, including selecting financial partners. Evans is on understanding why changes occur in addition to what they entail. Topics: changes in the mode of production, performance objectives, sources of inspiration, factory set-up, work organization, arenas of competition, and information technology. Implications for future design.

4 units, Spr (Bailey)

267. Innovations in Manufacturing—(Formerly IE 226.) Major trends in innovations in manufacturing as they have evolved over time. Emphasis is on understanding why changes occur in addition to what they entail. Topics: changes in the mode of production, performance objectives, sources of inspiration, factory set-up, work organization, arenas of competition, and information technology. Implications for future design.

4 units, Spr (Bailey)

268. Manufacturing Strategy—(Formerly IE 268.) For graduate students only; priority given to Manufacturing Systems Engineering. The development and implementation of the manufacturing functional strategy. Emphasis is on the integration of manufacturing strategy with the business and corporate strategies of a manufacturing-based firm. Topics: types of manufacturing technologies and their characteristics, quality management, capacity planning and facilities choice, the organization and control of operations, and determining manufacturing's role in corporate strategy. Prerequisite: 261 or 260.

3 units, Spr (Carlson)

269. Quality and Operations Management—(Formerly IE 221.) Quality is a means of survival and a strategic weapon for a firm. Using a case-based methodology, focus is on implementation issues and industrial trends from the strategic, operational, and organizational perspective. Manufacturing and service-based industries. Topics: statistical process control, inspection, experimentation, quality philosophies, customer satisfaction, etc.

4 units, Win (Kane)

270. Strategy in Technology-Based Companies—(Formerly IE 270.) For graduate students; priority given to IEEM. Introduction to the basic concepts of strategy, with emphasis on high technology firms. Topics: strategic alliances, standards setting, vertical integration, strategic choice, generic and hypercompetitive approaches, organizational capabilities, and complexity/evolutionary perspectives. Enrollment limited.

4 units, Aut (Eisenhardt)

271. Global Entrepreneurial Marketing—(Formerly IE 271.) Designed to equip an engineer with the marketing skills needed to launch and lead a high-growth, high-tech venture, cultivating the skills needed to market new products to new customers, using new technology, sometimes in a new company. The marketing challenges facing entrepreneurs who expand internationally early in the life of the company. Learning is by case method, working in teams, and with a field-based entrepreneurial project. Each student writes a strategic thinking paper. Team performance cultivates entrepreneurial leadership and teamwork skills. Prerequisites: 140, and Engineering 60. Recommended: 245, 273.

4 units, Win (Kosnik)

272. Entrepreneurial Finance—(Formerly IE 272.) Primarily for graduate engineering students. Introduction to the concepts in and around the financing of entrepreneurial companies. Focus is on teaching future general managers how to use financial perspective to make better decisions in entrepreneurial settings, including selecting financial partners, evaluating financing vehicles, and financing companies through all growth stages, from start-up through initial public offering. Prerequisites: 140, and Engineering 60. Recommended: 245.

3 units, Win (Mackenzie)

273. Technology Venture Formation—(Formerly IE 273.) Open to graduate students interested in high technology entrepreneurship. Emphasis is on how technology ventures are created. Topics: opportunity identification, market assessment, product plans, selling strategies, financing options, and teamwork. Student teams write and present a business plan. Enrollment limited. Recommended: 140, 270, 271, 272 or equivalent.

4 units, Aut, Spr (Lyons, MacLean)

274. Building Dynamic Entrepreneurial Organizations—(Formerly EES&OR 284.) Focus is on the dynamic development of corporate skills, knowledge, and infrastructure to compete in a changing global competitive environment due to rapid technology advancement, global economic development, changes in consumer's preference, and government regulations. Model analysis and case studies are used to develop a methodology in building dynamic entrepreneurial organizations in response to dynamic competitive requirements. Links between EES&OR core and the notion of managing change as a basis for a normative theory on entrepreneurial activities in new business creation and corporate expansion.

3 units, Spr (Tse)

4 units, Win (DeVilliers)

276. Managing to IPO: Control Systems—(Formerly IE 234; same as Business 319A.) How firms evolve and adapt their control/information systems when changes occur in their markets, technology, competition, and in their own internal capabilities. Emphasis is on the challenges faced by start-up and pre-IPO ventures when designing their control/information systems. Topics: target costing, activity-based management, quality and customer satisfaction, balanced scorecards, competitor cost/pricing analysis, and incentive-system design.

4 units, Win, Spr (Foster)

277. Creativity and Innovation in Organization—(Formerly IE 201.) For master's students and undergraduates (seniors only). Individual, group, and organizational perspectives on what sparks and hampers innovation. Lectures, exercises, case discussions, and group projects.

4 units, Win (Sutton)

278. Marketing for Technology-Based Companies—(Formerly IE 269.) Priority given to MS&E graduate students. Introduction to marketing strategy and execution for technology-based companies in imagination-intensive industries. Topics: market segmentation and selection, positioning, product management, pricing, channels of distribution, marketing communication. Using case studies based on real companies, students learn to diagnose problems and opportunities, make decisions, analyze customers, competitors, channels, economic and ethical issues that affect their decisions, and reality test their recommended approach. Prerequisites: 140, and Engineering 60. Recommended: 245.

4 units (Kosnik) not given 2000-01

279. Organizational Behavior, Management, and Work

280. Organization Behavior and Management—(Formerly IE 203.) Organization theory; concepts and functions of management; behavior of the individual, work group, and organization. Emphasis is on case and related discussion. Enrollment limited to 65 graduate students per section; priority given to IEEM majors.

4 units, Aut (Sutton)

281. Management and Organization of Research and Development—(Formerly IE 220.) The organization of R&D in industry and the problems of the technical labor force. Relevant theoretical perspectives from sociology, anthropology, and management theory on the social and pragmatic issues that surround technical innovation and the employment of scientists and engineers. Possible topics: organization of scientific and technical communities, industrialization of research, the nature of scientific and technical work, strategies for fostering innovation, careers of scientists and engineers, and managerial problems characteristic of R&D settings.

4 units (Barley) not given 2000-01
284. Technology and Work—(Formerly IE 223.) Theory and research on the social implications of technology and technological change for workers at all levels. Alternate conceptions of technology as social phenomenon, approaches to the study of technology in the workplace, reactions of individuals and groups to technological change, the construction of a technology's social meaning, and the management of technological change. Emphasis is on automation, electronic data processing, and sophisticated microelectronic technologies, including CAD-CAM systems, telecommunication networks, medical imaging technologies, artificial intelligence, and personal computers.

4 units (Barley) not given 2001-02

PUBLIC POLICY ANALYSIS

293. Technology in National Security—(Formerly EES&OR 293.) Undergraduate students register for 193; see 193.

3 units, Aut (Perry)

294. The Role of Analysis in Environmental Policy Decisions—(Formerly EES&OR 294.) Undergraduate students register for 194; see 194.

3-5 units, Spr (North)

298. Technology, Policy, and Management in Newly-Industrializing Countries—(Formerly IE 279; same as Science, Technology, and Society 279.) Technology is seen as the key to development and prosperity in most parts of the world. Building technological capability in newly-industrializing countries at the national and firm level. What makes technology special, government intervention that affects technology, the concept of technology leader and technology follower environments, the transfer of technology from "leader" countries, indigenous technological capability, human capital, culture and innovation, the role of small firms and new enterprises in technological capability. Managing innovation in firms: how innovation is different in technology-followers, organizing for shop-floor innovation, building an innovation culture, the special role of R&D in followers, the role of design, technology strategy for followers. Cases from Korea, India, Brazil, Singapore, and other NICs.

2-4 units (Forbes) given 2001-02

299. Voluntary Social Systems—(Formerly EES&OR 299.) Exploration of ethical theory, feasibility, and desirability of a social order in which coercion by individuals and government is minimized and people pursue ends on a voluntary basis. Topics: efficacy and ethics; use rights for property; contracts and torts; spontaneous order and free markets; crime and punishment based on restitution; guardian-ward theory for dealing with incompetents; the effects of state action-hypothesis of reverse results; applications to help for the needy, armed intervention, dealing with incompetents; the effects of state action-hypothesis of crime and punishment based on restitution; guardian-ward theory for

1-3 units, Win (Howard)

PRIMARILY FOR DOCTORAL STUDENTS

GENERAL AND SYSTEMS ANALYSIS METHODS

300. Ph.D. Qualifying Tutorial—(Formerly EES&OR 400.) Restricted to Ph.D. students assigned tutorials as part of the EES&OR Ph.D. qualifying process.

1-3 units, Aut, Win, Spr, Sum (Staff)

301. Thesis and Dissertation Research—(Formerly EES&OR 409, IE 301.) Work on dissertation for Ph.D. degree or thesis for Engineer's degree. Limited to students who have been advanced to candidacy for the degree of Ph.D. or Engineer degrees.

1 or more units, Aut, Win, Spr, Sum (Staff)

302. Optimal Dynamic Systems—(Formerly EES&OR 331.) Controllability and observability, stabilizing feedback. Optimal control theory and the Pontryagin maximum principle; problems with inequality constraints, transversality condition, discounting cost, infinite horizon problem; the Hamilton-Jacobi-Bellman equation; stochastic control. Applications: optimal economic growth, control of predator/prey systems, spread of product innovation. Prerequisite: 231.

3 units, Aut (Van Roy)

OPTIMIZATION

3 units, Aut (Cottle)

311. Optimization—(Formerly EES&OR 311.) Applications, theory, and algorithms for finite-dimensional linear and nonlinear optimization problems with continuous variables. Elements of convex analysis, first- and second-order optimality conditions, sensitivity and duality. Algorithms for unconstrained optimization, linearly constrained optimization problems (including linear and quadratic programs), and nonlinearly constrained problems. Prerequisites: Mathematics 113, 115.

3 units, Win (Cottle)

3 units, Aut (Murray)

313. Vector Space Optimization—(Formerly EES&OR 313.) Optimization theory from the unified framework of vector space theory, i.e., treating together problems of mathematical programming, calculus of variations, optimal control, estimation, and other optimization problems. Emphasizes geometric interpretation. Duality theory. Examples. Topics: vector spaces, including function spaces; Hilbert space and the projection theorem; dual spaces and the separating hyperplane theorem; linear operators and adjoints; optimization of functionals, including theory of necessary conditions in general spaces, and convex optimization theory; constrained optimization, including Fenchel duality theory. Prerequisite: Mathematics 115.

3 units, Aut (Luenberger) alternate years, not given 2001-02

316. Linear Complementarity—(Formerly EES&OR 316.) Theory of the linear complementarity problem, its applications, and algorithms for its solution. Elements of quadratic programming theory. Pivotable algebra, Schur complements, and matrix classes. Analytic existence theorems. Lemke's algorithm, the principal pivoting method and degeneracy resolution techniques. Indirect algorithms. Prerequisite: 311 or consent of instructor.

3 units, Aut (Van Roy)

3 units (Van Roy) not given 2000-01

PROBABILITY AND STOCHASTIC SYSTEMS

321. Stochastic Systems—(Formerly EES&OR 321.) Topics in stochastic processes, emphasizing applications. Markov chains in discrete and
continuous time; Markov processes in general state space; Lyapunov functions; regenerative process theory; renewal theory; martingales, Brownian motion, and diffusion processes. Application to queueing theory, storage theory, reliability, and finance. Prerequisites: 221 or Statistics 217; Mathematics 113 and 115.

3 units, Win (Glynn)

322. Stochastic Calculus and Control—(Formerly EES&OR 322.) Ito integral, existence and uniqueness of solutions of stochastic differential equations (SDEs), diffusion approximations, numerical solution of SDEs, controlled diffusions and the Hamilton-Jacobi-Bellman equation, statistical inference for SDEs. Applications to finance and queueing theory. Prerequisites: 221 or Statistics 217; Mathematics 113 and 115.

3 units, Spr (Glynn) alternate years, not given 2001-02

3 units (Glynn) alternate years, given 2001-02

INFORMATION SCIENCE AND TECHNOLOGY

334. Network Architectures and Performance Engineering—(Same as Electrical Engineering 384S.) Introduction to the modeling and control methodologies used in network performance engineering: Markov chains and stochastic modeling, queuing networks, stochastic simulation, dynamic programming, network optimization algorithms, large-scale distributed computation for networking operations etc. The application of such methodologies to key design issues in high-performance network architectures for IP networking, wireless networks, and optical networks: traffic modeling, congestion control, IP network dynamics, TCP flow control, quality of service support, network admission control and operations management, power control and dynamic bandwidth allocation in wireless networks, wavelength routing and topology design of optical networks, server placement and capacity management etc. Prerequisites: 284 and basic understanding of probability.

3 units, Spr (Bambos)

335. Queuing Systems and Networks—(Formerly EES&OR 373.) Advanced stochastic modeling and analysis of systems involving queuing delays. Markovian queues. Stability analysis of the GI/G/1 queue. Key results on single and multi-server queues. Approximation methods. Queuing networks. Introduction to controlled queuing systems. Applications to performance modeling, analysis, and evaluation of communication networks, computer systems, flexible manufacturing systems, service systems, etc. Prerequisite: 221 or equivalent.

3 units, Aut, Spr (Bambos) alternate years, not given 2001-02

336. Topics in Queuing Networks—(Formerly EES&OR 374.) Advanced efficient control and high-performance design of queuing systems involving job scheduling and resource (server) allocation. Dynamic and stochastic scheduling. Resource allocation in random environments. Real-time scheduling algorithms. Efficient control of queuing networks (routing, admission, flow control, etc.). Performance evaluation of complex queuing structures; identification of performance bottlenecks and techniques for alleviating them. General principles and methodology of high-performance design. Case studies and applications to the design of communication networks, high-speed switching, computer systems, flexible manufacturing systems, service systems, parallel and distributed processing networks, etc. Prerequisite: 335 or equivalent.

3 units (Staff) alternate years, given 2001-02

3 units, Win (Van Roy)

ECONOMICS, FINANCE, AND INVESTMENT

341. Advanced Economic Analysis—(Formerly EES&OR 341.) Builds on 241 concepts. Market structure and industrial organization (oligopoly, strategic behavior of firms, game theoretic models); economics of uncertainty; general equilibrium theory and economic efficiency (formulation, Walras’ Law, existence, uniqueness, duality between efficiency and general equilibrium; trade); intertemporal equilibrium and asset markets; macroeconomic analysis and economic growth (accounting identities, general equilibrium perspective); public goods, externalities. Background for additional advanced economics. Prerequisite: 241.

3 units, Spr (Sweeney)

342. Advanced Investment Science—(Formerly EES&OR 342.) Advanced topics and research in the theory and application of investment concepts. Topics: forwards and futures contracts, continuous and discrete time models of stock price behavior, geometric Brownian motion, Ito’s lemma, basic options theory, Black-Scholes equation, advanced options techniques, models and applications of stochastic interest rate processes, and optimal portfolio growth. Computational issues and general theory. Teams work on independent projects that apply the principles. Prerequisite: 242.

3 units, Win (Eaves)

344. Equilibrium Programming—(Formerly EES&OR 344.) Mathematical models of equilibria in economics and in conflict. Price equilibria. Extensive form games, general and partial equilibrium economic models, Nash equilibria. Solution of equilibrium models by the homotopy principle: deform the system to an easily and uniquely solved one, and follow the solution of the system as it is deformed, with retrogressions, back to the original system. Piecewise linear and differential homotopies and curve following. Subdivisions, atlases, regularity, degree, fixed points, stationary points, general and special case algorithms. Prerequisite: 211.

3 units, Win (Eaves)

346. Economic Analysis of Market Organizations—(Formerly EES&OR 346.) For second-year or more advanced graduate students. Studies microeconomics and management science to decision behavior and mechanism design in market organizations, emphasizing asymmetric information structures. Topics: game theory, economics of information, and nonlinear pricing. Applications: priority pricing of congested systems, emission trading of pollutants, design of competitive markets for electric power, competitive product pricing, etc. Prerequisites: basic knowledge of microeconomics, optimization, probability theory, and decision theory. Recommended: familiarity with mathematical modeling and skills in computer programming.

3 units, Aut (Chao)

347. Capital Investment and Financing—(Formerly EES&OR 347.) Optimal capital investment and financing decisions for firms operating in a dynamic and uncertain environment. Forecasting and valuing project cash flows. Designing and managing projects to create and capitalize on operating options and follow-on investment opportunities. Financing alternatives and the relationship between investment type and optimal financial structure. Prerequisites: basic finance theory (equivalent of 242 or Industrial Engineering 235).

3-4 units (Staff) not given 2000-01

348. Optimization of Uncertainty and Applications in Finance—(Formerly EES&OR 358.) How to make optimal decisions in the
349. Investment Science Frontiers—(Formerly EES&OR 349.) Advanced concepts of investment science with emphasis on theories and methods for solving practical problems: real options theory and practice; valuing and structuring projects, mergers, acquisition and contracts; designing portfolios for optimal growth; and managing risk and enhancing value within a complex business enterprise. Combination lecture, seminar, and project. No auditors. Prerequisites: 242, 242.

3 units (Luenberger) alternate years, given 2001-02

DECISION AND RISK ANALYSIS

350. Doctoral Seminar in Risk Analysis—(Formerly IE 340.) Limited to doctoral students. Reading/review of the literature in the fields of engineering risk assessment and management. New methods and topics, emphasizing probabilistic methods and decision analysis. Applications to risk management problems involving the technical, economic, and organizational aspects of engineering system safety. Possible topics: treatment of uncertainties, learning from near misses, and use of expert opinions.

3 units, Spr (Paté-Cornell)

3 units, Spr (Veinott)

352. Decision Analysis II—(Formerly EES&OR 352.) The extension of decision making from a system of thought about decisions to the considerations necessary for aiding other people and organizations in decision making: decision engineering. Topics: how to organize the decision conversation, the role of the decision analysis cycle and the model sequence, assessing the quality of decisions, framing decisions, the decision hierarchy, strategy tables for alternative development, creating decision diagrams that are sparse and effective, understanding and overcoming biases in assessment, developing and using evocative and assessed knowledge maps, dealing with “uncertainty about probability.” Interpretation of various forms of sensitivity analysis, use of approximations, value of revelation, value of joint information, options, flexibility, bidding, assessing and using corporate risk attitude, risk sharing and scaling, and treating decisions involving health and safety. See 353 for continuation of 352. Prerequisite: 252.

4 units, Win (Howard)

353. Decision Analysis III—(Formerly EES&OR 353.) Decision analysis beyond the basic paradigm, emphasizing determining and extending the boundaries of systematic analysis of decisions. Topics: the concept of decision composite; probabilistic insurance and other challenges to the normative approach; the relationship of decision analysis to classical inference and data analysis procedures; the likelihood and exchangeability principles; inference, decision, and experimentation using conjugate distributions; developing a risk attitude based on general properties; examination of alternative decision-aiding practices like analytic hierarchy and fuzzy approaches. Students make presentations on current research. Object is to prepare doctoral students for research and to enable all to understand the discipline at the fundamental levels. Prerequisite: 352.

3 units, Spr (Howard)

354. Topics in Financial Risk Analysis—(Formerly EES&OR 245.) Mathematical theory of: stochastic dominance, stochastic approximation, multivalued (“fuzzy”) logic. Applications in finance: arbitrage in financial markets, non-parametric approaches to prediction of financial distress, analysis of anomalies in financial markets, alternative approaches to pricing derivative securities. Analysis of financial frauds and insider trading. Prerequisites: probability at the level of EES&OR 221; fundamental finance course, e.g., EES&OR 242 or IEEM 235; facility with formal mathematical models.

3 units, Spr (De Villiers)

3 units, Win (Shachter)

PRODUCTION OPERATIONS, SERVICES, AND MANUFACTURING

3 units, Aut (Veinott)

362. Advanced Models in Production and Operations—(Formerly IE 362.) The design and operation of production-inventory systems, production scheduling, capacity planning, plant location, sequencing, assembly-line balancing, multigoal optimizations. Readings primarily from journal articles. Prerequisite: 260.

3 units, Spr (Carlson) alternate years, not given 2001-02

3 units, Win (Staff) alternate years, not given 2001-02

364. Single and Multi-Location Inventory Models—(Formerly IE 364.) Theoretical treatment of the management and control problems of inventory systems in production and distribution, with models for single and multi-location systems. Emphasis is on operating characteristics, performance measures, and optimal operating and control policies. Prerequisite: Statistics 217 or equivalent.

3 units (Hausman) alternate years, given 2001-02

primarily on deterministic models. Topics: resource allocation problems, scheduling and sequencing problems, models of flexible manufacturing systems, manufacturing cell design, and queuing network models of manufacturing systems. Prerequisites: 260 or equivalent, Engineering 62 or equivalent.

### 367. Advances in Integrated Supply Chain Management—(Formerly IE 367.)
The integration and coordination of material, information, and financial flows in a supply chain that spans suppliers, manufacturers, distributors, logistics providers, and customers. Recent advances prepare students for research. Topics: information distortion, postponement, centralized vs. decentralized control, vendor managed inventory, logistic restructuring, incentive issues, manufacturer and retailer interface, replenishment coordination, and value of information.

### STRATEGY, ENTREPRENEURSHIP, AND MARKETING

#### 374. Creativity and Innovation in Organizations—(Formerly IE 324.)
Draws on anthropology, economics, engineering, history, organizational behavior, psychology, and sociology to explore the meaning, determinants, and effects of creativity in organizations. Theory and research on individual creativity; creativity as a social process. Focus is on understanding, building, and testing scholarly theory about creativity. Enrollment limited to 12. Prerequisites: doctoral standing and completion of Psychology 212 and Sociology 360.

<table>

#### 376. Strategy and Organization Doctoral Research Seminar—(Formerly IE 326.)
Review of current research at the interface between strategy policy and organization theory. Topics: top management teams and strategic decision making processes; strategic boundary issues (e.g., strategic alliances, vertical integration, and diversification); reward structure and board relationships; evolution of strategies, technology, and populations of organizations. Enrollment limited and at the discretion of instructor. Prerequisite: Sociology 360 or equivalent.

#### 382. Organizations as Social Networks—(Formerly IE 322.)
Social structures can be investigated as social networks. Organizational and inter-organizational structures may be analyzed as patterned relationships among individuals, groups, and other organizations. Such networks appear as predictors of a variety of social dynamics (attitude similarity, the diffusion of innovation, turnover, and the allocation of organizational resources). Methods for collecting and analyzing network data include graph theory, sociometry, clique detection, centrality analysis, blockmodeling, and the quadratic assignment procedure. Readings of recent published research, actual data sets, and relevant computer programs. Prerequisites: one or more courses in anthropology, organizational behavior, political science, psychology, or sociology. Recommended: course in statistics or research methods.

### 383. Doctoral Seminar on Ethnographic Research—(Formerly IE 323.)
Designed for graduate students; upper-level undergraduates with consent of instructor. Ethnosemantic interviewing and participatory observation is emphasized. Techniques for taking, managing, and analyzing fieldnotes and other qualitative data. 15 hours per week outside of class collecting and analyzing own data. Methods texts and ethnographies offer examples of how to analyze and communicate ethnographic data. Prerequisite: consent of instructor.

<table>

#### 385. Remote and Distributed Work—(Formerly IE 325.)
Focus is on understanding how being remote from the objects on which one works or distributed from one’s counterparts can affect productivity, interpersonal relationships, perceptions of work, information sharing, organizational structure, and other factors related to work and work effectiveness. Current research on distributed work and research in related areas that provide a theoretical foundation for understanding the impact of distance on work. Prerequisite: consent of instructor.

### PROJECT COURSES, SEMINARS, AND WORKSHOPS

#### 401. Cases and Projects in Decision Engineering—(Formerly EES&OR 401.)
The development of communication, organization, and modeling skills as they relate to decision making in operations, strategy, and policy. Student teams compete in cases and projects. Emphasis is on problem identification, yield consideration, teamwork, project scheduling, task definition, task allocation, task amalgamation, group behavior, technical writing, public speaking, critique and defense, and the use of software, literature, principals, and experts. Enrollment limited. Prerequisites: three courses in MS&E or equivalent. Corequisites: three more courses in MS&E or equivalent.

<table>

#### 402. Sponsored Projects in Decision Engineering—(Formerly EES&OR 402.)
Each student team addresses a project in operations, strategy, or policy as sponsored by a business, medical, or government client. Emphasis is on team interaction with the sponsor, model construction and analysis, data collection, use of literature and experts, formulation of recommendations, and communication. Enrollment limited. Prerequisites: 401, six courses in MS&E or equivalent, consent of instructor. Corequisites: three more courses in MS&E or equivalent.

#### 411. Topics in Mathematical Programming Seminar—(Formerly EES&OR 457.)
Presentations by students and invited speakers. Introduction to techniques for solving structured linear programs. A fundamental problem of the decision sciences is finding an "optimal" solution when some of the parameters of a planning or design problem (e.g., coefficients and right-hand sides of a linear program) are not known with certainty. Such problems, when converted to deterministic equivalent, were too large to solve in practice. Recent approaches that solve important classes of stochastic programs using decomposition and (importance) sampling techniques.

430. Contextual and Organizational Issues in Human-Computer Interaction—(Formerly IE 205.) Focus is on the contextual issues associated with designing and using computer interfaces and technology, providing insights into, experience with, and ways of understanding issues in work and consumer settings that influence the design of computer interfaces. Student team projects develop skills in: observing individuals and groups of people in context, using models of work and other activity to extend their design capabilities, identifying constraints and tradeoffs on designs within the context of use, and observing and working with people in interdisciplinary design groups. Enrollment limited. Prerequisite: Computer Science 247A or consent of instructor. 4 units, Spr (Hinds)

442. Investment Projects—(Formerly EES&OR 442.) Students teams address a practical problem in investment. Faculty assist in identifying appropriate projects and in developing students' understanding of relevant analytical tools. Students assume full responsibility for project analysis and presentation to the decision maker. 4 units (Staff) not given 2000-01

444. Investment Practice—(Formerly EES&OR 444.) Project designed to enhance student's abilities to formulate and design superior solutions to financial issues in industry and the financial services sector. Short projects illustrate the basic application and implementation of investment principles. Students complete a new project from industry. Enrollment limited to 30 EES&OR students. Prerequisites: 242, 342. 4 units, Spr (R. Luenberger)

446. Transportation, Energy, and Environment Research Roundtable (TEERR)—(Formerly EES&OR 446.) Presentations and discussions of research in progress or contemplated, focused on the interplay of transportation, energy, and environmental economics and policy issues. Students present either their own research or, subject to approval, recent research by others. 1 unit (Sweeney) not given 2000-01

447. Investment Research Seminar—(Formerly EES&OR 447.) Presentation/discussion of recent research on investment. Topics vary with the current research interests of participants. Students should be actively involved in research on investment. Prerequisite: consent of instructor. 1-3 units (Staff) not given 2000-01

452. Decision Analysis Practice—(Formerly EES&OR 452.) Students trained in decision analysis (DA) theory apply their knowledge in practice. Student teams analyze the current decision of an actual decision-maker in business, medical, non-profit, or governing organizations. Teams gain experience framing and structuring a decision, developing decision models, determining trade-offs in values and preferences, and appraising the basis for decisions. Business projects typically consider capital investment, R&D, product development, or marketing and pricing decisions for major corporations, high-technology start-up businesses, or family-owned businesses around the world. Medical projects address critical diagnosis and treatment decisions in cancer, emergency medicine, gynecology, nephrology, pediatrics, pharmacology, or psychiatry. Projects include business problems, medical projects, and choices faced by non-profit charitable and educational institutions. 4 units, Spr (Holtzman, Robinson)

454. Decision Analysis Seminar—(Formerly EES&OR 454.) Discussion of current research in decision analysis and related topics presented by doctoral students and invited speakers. 1 unit, Aut, Win, Spr (Howard)

455. Intelligent Decision Systems—(Formerly EES&OR 455.) How to automate a decision analysis consultation to address large numbers of similar decisions (e.g., over the Internet), extending decision analysis (DA) beyond individual decisions to classes of decisions that share a common structure. Decision-class analysis is the foundation for intelligent decision system (IDS) design. Decision class analysis, decision diagram formulation, taxonomy of ignorance, disjoint knowledge maps, preference models, precondition-action rules, and formal decision methods; other topics depend on student interests. Projects have addressed such decision classes as: consumer purchases, personal investments, medicine, manufacturing, on-board decision-making for planetary exploration, and sailboat racing. Prerequisite: 352. Recommended: 452 (may be taken concurrently). 4 units, Spr (Holtzman)

458. Decision Structuring Seminar—(Formerly EES&OR 458.) Practical develops skills in the using of tools and techniques of decision structuring. Student teams develop the right setting and frame to structure complex decision situations. Team presentation on: a decision described in a recent news article; the issues in a business case study; and a current decision of a decision-maker in a business, medical, non-profit, or governing organization. Topics practiced: traps and tools of decision framing; up and down the decision hierarchy; creative people and the creative process; dynamics of strategy tables; inside-out and outside-in; relevance and decision diagrams; forces and dialectics; teamwork; surmounting organizational barriers when to be quick and dirty; when to be thorough and tidy; intriguing and insightful presentations; and differences and similarities in how decisions are structured in the high-tech pharmaceuticals, medical, energy, transportation, and financial industries. For students taking 452 in the following quarter, the teams and initial structuring of a decision can form the basis for a complete decision analysis project. Prerequisite: 252. Recommended: 352, 456. 2 units, Win (Holtzman, Robinson)

459. Interdisciplinary Seminar on Conflict Resolution—(Formerly EES&OR 489; same as Economics 386, Law 611, Psychology 283.) Addresses problems of conflict resolution and negotiation from an interdisciplinary perspective. Presentations by faculty and by scholars from other universities. 1-2 units, Win (Arrow, Ross, Wilson, Alexander)

464. Global Project Coordination—(Formerly IE 264.) Students engage in projects that are local in nature, and which are related to the planning and design of supply chains and product development. Project teams from Stanford and an overseas university work on common projects using telephones, faxes, emails, internet, video-conferencing, face-to-face meetings, etc. As part of the project, students travel to Hong Kong or the Netherlands. 3 units, Win (Tabrizi) Spr (Kopczak)

472. Industry Thought Leaders Seminar—(Formerly IE 292.) Dialogue with leading entrepreneurs, corporate executives, venture capitalists, and technology leaders from Silicon Valley and around the world. A prominent entrepreneur or other industry thought leader provides cutting-edge ideas and pragmatic lessons, creating a gathering place for Stanford's extended entrepreneurial community. Autumn: strategy. Winter: entrepreneurial marketing. Spring: entrepreneurial leadership. 1 unit, Aut (Eisenhardt) Win (Kosnik) Spr (Byers)

473. Project Course in Strategy Modeling—(Formerly EES&OR 483.) The design and application of formal models in the study of strategic planning problems. Problems involving issues of technology development, resource management, and uncertainty in a corporate setting. Emphasis is on the integrated utilization of modeling tools drawn from diverse methodologies and the requirements for successful application in a policy-making or corporate strategy context. Links between art, theory, and practice are emphasized. Prerequisites: 211, 241, and 252 or equivalent. Recommended: some background in finance and marketing. 4 units, Spr (Weyant)

479. Management of Technological Enterprises Seminar—(Formerly EES&OR 479.) Speakers from industry on leading edge technologies
and their management. Seminar series focus is on the electronic foodchain in the Internet age, primarily semiconductor, computer, telecommunication, and software industry experts and executives. Objectives: provide insights into industry dynamics and economics, and the development of strategies to succeed in a volatile marketplace crowded with mature and emerging technologies; and to help synthesize the variety of systems approaches learned in “solving” key strategic issues faced by the high tech industry.

1 unit, Spr (Tse)

493. Decision Making and National Security Problems—(Formerly EES&OR 493.) Seminar for graduate students with an interest in government decision making in areas which involve a technological component, e.g., defense, energy, and environment, and high-technology trade and policy. Follows 193 or 194.

3 units, Spr (Perry)

495. Quantitative Analysis of Public Policy Decisions—(Formerly EES&OR 495.) A current public policy problem is addressed as a single project team, completing the major phases of analysis during the quarter: framing, modeling, data gathering, evaluation, and communication. Instructor coaches the team and provides guidance on gaps in the team’s knowledge. Past topics: environmental, health, technology, and transportation issues. Enrollment limited. Prerequisites: 211, 231, 241, 252, or equivalents, or consent of instructor.

3 units, Spr (Borison)

498. Medical Modeling Workshop—(Formerly EES&OR 498.) Discussion of current research in quantitative medical modeling by students, faculty, and invited speakers.

1 unit, Aut, Win, Spr (Shachter)

MATERIALS SCIENCE AND ENGINEERING

Chair: Bruce M. Clemens

Associate Chair: Reinhold H. Dauskardt

Associate Professor: Reinhold H. Dauskardt

Assistant Professors: Michael D. McGehee, Paul C. McIntyre, Charles B. Musgrave, Shan X. Wang

Professor (Research): Robert S. Feigelson

Courtesy Professors: Curtis W. Frank, James S. Harris, James D. Plummer, Jonathan F. Stebbins

Courtesy Associate Professor: Huajian Gao

Courtesy Assistant Professor: Kyeongjae Cho

Acting Assistant Professor: Jonathan Doan

Consulting Professors: Paul A. Flinn, Michael A. Kelly, Thomas Marieb, Jeffrey Wadsworth

Consulting Assistant Professor: Keith W. Rollag

The Department of Materials Science and Engineering is concerned with the relation between the structure and properties of materials, factors that control the internal structure of solids, and processes for altering the structure and properties of solids. It brings together in a unified discipline the developments in physical metallurgy, ceramics, and the physics and chemistry of solids. The undergraduate program, described under the “School of Engineering” section of this bulletin, provides training for the materials engineer and also preparatory training for graduate work in materials science. Capable students are encouraged to take at least one year of graduate study to extend their course work. Coterterminal degree programs are encouraged both for undergraduate majors in Materials Science and Engineering and for undergraduate majors in related disciplines. Graduate programs lead to the degrees of Master of Science, Engineer, and Doctor of Philosophy.

FACILITIES

The department is based in the Thomas F. Peterson Engineering Laboratory (Building 550), with extensive facilities in the newly renovated McCullough building and the new McCullough Annex. Between Peterson and the new McCullough complex are housed offices for the chair and most of the faculty, for the administrative and technical staff, and for most graduate students, along with a number of lecture and seminar rooms. Facilities for teaching and research are also available, including equipment for electrical measurements; mechanical testing of bulk and thin film materials; fracture and fatigue of advanced materials; metallurgy; optical, scanning, transmission electron microscopy and atomic force microscopy; UHV sputter deposition; vacuum annealing treatments; wet chemistry; and x-ray diffraction. The McCullough Complex is also the home for the Center for Research on Information Storage Materials (CRISM) with corresponding facilities for magnetic measurements. The Rapid Prototyping Laboratory (RPL), housing material deposition and removal stations, is a joint facility with Mechanical Engineering, and is housed next to the Peterson Labs in Building 530. The department maintains two microcomputer clusters for its students, one with a number of Macintosh and Windows computers, and the other with five HP and DEC workstations. Both clusters are linked with the worldwide Internet network.

Depending on the needs of their program, students and faculty also conduct research in a number of other departments and independent laboratories. Chief among these are the Center for Integrated Systems (CIS), the Center for Materials Research (CMR), and the Stanford Synchrotron Radiation Laboratory (SSRL).

The Center for Integrated Systems (CIS) is a laboratory joining government and industrially funded research on microelectronic materials, devices, and systems. It houses a 10,000 square foot, class 100 clean room for Si and GaAs integrated circuit fabrication; a large number of electronic test, materials analysis, and computer facilities; and office space for faculty, staff, and students. In addition, CIS provides start-up research funds and maintains a “Fellow-Mentor” program with industry.

For information on CMR and SSRL, see the “Center for Materials Research” and “Stanford Synchrotron Radiation Laboratory” sections of this bulletin.

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

The undergraduate program provides training in solid state fundamentals and in physical metallurgy. Students desiring to specialize in this field during their undergraduate period may do so by following the curriculum outlined in the “School of Engineering” section of this bulletin as well as the School of Engineering Undergraduate Handbook. The University’s basic requirements for the bachelor’s degree are discussed in the “Undergraduate Degrees” section of this bulletin. Electives are available so that students with broad interests can combine materials science and engineering with work in another science or engineering department.

For information about an MSB minor, see the “School of Engineering” section of this bulletin.

COTERMINAL B.S./M.S. PROGRAM

Stanford undergraduates who wish to continue their studies for the Master of Science degree in the coterminous program should apply for entrance after the beginning of the eighth quarter of undergraduate work and before the end of the eleventh quarter. The application must give evidence that the student possesses the potential for strong academic performance at the graduate level. Each application is evaluated by the department’s Admissions Committee. Scores from the Graduate Record Exam (GRE) General Test must be reported before action can be taken on an application. Materials science is a highly integrated and interdisci-
ciplinary subject, and so applications from students of any engineering or science undergraduate major are encouraged. Information forms pertaining to the coterminal program may be obtained from the department's Student Resource Center, room 550B, or from Degree Progress in the Registrar's Office, Old Union. Students entering the coterminal program and receiving both their B.S. and M.S. degree in Materials Science and Engineering should also see the "Master of Science for MS&E Coterminal Students" section below.

GRADUATE PROGRAMS

Graduate students can specialize in any of the areas of materials science and engineering. In collaboration with other departments of the University, additional special programs are available.

MASTER OF SCIENCE

The University’s basic requirements for the M.S. degree are discussed in the “Graduate Degrees” section of this bulletin. The following are specific departmental requirements.

The Department of Materials Science and Engineering (MSE) requires a minimum of 45 units for a master’s degree. Up to 9 units of work done as a graduate student at another institution may sometimes be transferred to give unit credit toward the electives used in acquiring a Stanford degree. Substitution of courses taken for specific Stanford courses is approved on the Master’s Proposal Proposal. Master’s Proposal forms should be filled out, signed by the students’ academic adviser, and submitted to the department’s Student Services Coordinator by the end of the first week of the students’ second quarter of study. (Generally, this means by the end of the first week of Winter Quarter.) Final changes to the master’s program must be submitted no later than one academic quarter prior to degree conferral.

Degree requirements (for students entering after September 1, 1997) are as follows:

1. A minimum of 33 units of MSE course work, including cross-listed courses, taken for a letter grade. The following are limitations:
   a) A maximum of 9 units of cross-listed courses may be used in fulfilling this requirement.
   b) One-unit seminars and research units cannot be used to fulfill this requirement.
2. Lab courses MSE 171, 172, 173 (which count toward the required 33 units of MSE course work).
   Note: students who have had equivalent lab courses at other universities, equivalent practical experience, or have a materials related degree or background are expected to file a petition with the department’s Student Services Coordinator to have this requirement waived.
3. Six courses selected from MSE 152, 251, and 201 through 209. These “core” courses count towards the required 33 units of MSE course work. However:
   a) MSE 152 is not an option for students with materials science undergraduate degrees.
   b) MSE 251 may not be used to fulfill this "core" requirement if the student has a materials science undergraduate degree, although it may be applied towards the required 33 units of MSE course work.
4. Approved course electives to bring total units to 45. Of the 12 units of elective courses:
   a) Nine of the 12 units must be taken for a letter grade.
   b) A maximum of 3 units may be seminars.
   c) If writing a Master’s Research Report, a minimum of 6 and a maximum of 9 units of MSE Research units may be used.
   d) A maximum of 3 units may be undergraduate units (offered at Stanford University).
   e) A maximum of 5 units may be used for a foreign language course (not including any remedial English courses).
   f) The combination of seminar, undergraduate, and language units may not exceed 6 units total.
   g) The combination of research, seminar, undergraduate, and language units may not exceed 12 units total. (Research units are only allowed when writing a Master’s Research Report.)
5. A minimum grade point average (GPA) of 2.75 for course work at Stanford.

All proposed degree programs are subject to approval by the department’s Academic Degree Committee, which has responsibility for assuring that each proposal is a technically coherent program.

PETITION PROCESS FOR TRANSFER FROM M.S. TO PH.D. DEGREE PROGRAM

When a student is admitted to the graduate program, he or she is admitted specifically into either the M.S. or the Ph.D. program. Admission to the Ph.D. program is required for the student to be eligible to work towards the Ph.D. degree. A student in the M.S. program can petition to be admitted to the Ph.D. program by filing an M.S. to Ph.D. Transfer Petition.

This petition must be accompanied by a one-page statement of purpose stating the reasons why the student wishes to transfer to the Ph.D. program, and two letters of recommendation from members of the Stanford faculty, including one from the student’s prospective adviser and at least one from an MSE faculty member belonging to the Academic Council.

The M.S. to Ph.D. Transfer Petition is due to the Student Services Coordinator by the end of the second week of Spring Quarter during the student’s first year in the M.S. program. Only students enrolled in the 200 series core-course sequence are eligible to petition, and a grade point average (GPA) of 3.25 or better in the first two quarters of the core-course sequence is required.

Transferring to the Ph.D. program is a competitive process and only fully qualified M.S. students are admitted. The Admissions Committee and the department chair consider the student’s original application to the graduate program as well as the material provided with the transfer petition. Decisions regarding these petitions are normally available by the fourth week of Spring Quarter.

M.S. RESEARCH REPORT

Students wishing to take this option must submit a program of study, including not more than 9 and no less than 6 MSE research units, to the department for approval at least two quarters before the degree is granted. The total combined units of MSE research units, seminars, language courses, and undergraduate courses cannot exceed 12. If a master’s research report is not to be submitted, units of MSE 200 cannot be applied to the department’s requirement of 45 units for the master’s degree.

The report must be approved by two faculty members. One faculty member is the student’s research adviser. The other faculty member is assigned by the department. Three copies of the report (one copy for each approving faculty member and the department library), in final form and signed by two faculty members, must be in the hands of the department’s Student Services Coordinator one week prior to the beginning of the final examination period of the final quarter of the program. The report is not an “official” University thesis but rather is intended to demonstrate to the department faculty an ability to conduct and report directed research. The Master’s Report is not appropriate for students wishing to petition for the Ph.D. program. Refer to the Materials Science and Engineering Student Handbook for more information and further clarification concerning this report.

M.S. FOR MSE COTERMINAL STUDENTS

The University’s basic requirements for the M.S. degree are discussed in the “Graduate Degrees” section of this bulletin. The following are specific departmental requirements.

The Department of Materials Science and Engineering (MSE) requires a minimum of 45 units for a master’s degree. Students who have received or are currently working towards a B.S. degree in Materials Science and Engineering from Stanford and are pursuing a M.S. in Materials Science and Engineering should follow the requirements below in lieu of those stated in the “Master of Science” section listed above. Master’s Program Proposal forms should be filled out, signed by the students’ academic adviser, and submitted to the department’s Student Services Coordinator by the end of the first week of the students' second
quarter of study. (Generally, this means by the end of the first week of Winter Quarter.) Final changes to the master’s program must be submitted no later than one academic quarter prior to degree conferral. Degree requirements (for students who entered after September 1, 1997) are as follows:

1. A minimum of 21 units of MSE course work taken for a letter grade. Crosslisted courses, 1-unit seminars, research units and/or MSE 400 cannot be used to fulfill this requirement. These 21 units of MSE courses must include:
   a) The three remaining core classes (MSE 191/201 to 199/209) not taken for the B.S. degree in MSE.
   b) Twelve units of non-crosslisted MSE 300-level courses (not including 300).
2. Approved course electives to bring the total units to 45. Of the 24 units of elective courses:
   a) Twenty-one of the 24 units must be taken for a letter grade.
   b) A maximum of 3 units may be seminars.
   c) If writing a Master’s Research Report, a minimum of 6 and a maximum of 9 units of M.S. research units (MSE 200) may be used.
   d) A maximum of 6 units may be undergraduate units.
   e) A maximum of 5 units may be used for a foreign language course (not including any remedial English courses).
   f) The combination of seminar, undergraduate, and language units may not exceed 9 units total.
   g) The combination of research*, seminar, undergraduate, and language units may not exceed 15 units total.
3. A minimum grade point average (GPA) of 2.75 for course work at Stanford.

* See the Master’s Research Report section listed above, noting the additional unit privileges allotted to coterminal students. See the department's Student Services Coordinator for more information and/or clarification on what constitutes an approved course.

### Engineer

The University’s basic requirements for the degree of Engineer are outlined in the “Graduate Degrees” section of this bulletin.

A student wishing to enter the Engineer program must have completed the substantial equivalent requirements of the M.S. in Materials Science and Engineering, and must file with the department’s Student Services Coordinator a petition requesting admission to the program, as well as stating the type of research to be done and the professor who will be supervising. Once approved, the Application for Candidacy must be submitted to the department’s Student Services Coordinator a petition requesting admission to the program, as well as stating the type of research to be done and the professor who will be supervising. Once approved, the Application for Candidacy must be submitted to the department’s Student Services Coordinator by the end of the first week of the preceding quarter. Final changes to the master’s program must be submitted no later than one academic quarter prior to degree conferral.

1. Complete the requirements for the M.S. in Materials Science and Engineering (MSE), unless receiving residency credit for completing a master’s degree elsewhere.
2. Pass a departmental oral qualifying examination the second year after admission. A GPA of 3.25 from the nine core classes (201-209) is required for admission to the Ph.D. qualifying exam. Students whose GPA is between 3.00 and 3.25 may petition for possible admission to the exam. Students who have passed the departmental oral examination are required to complete the Application for Candidacy for the Ph.D. degree by the end of the quarter in which they pass the exam. Final changes in the Application for Candidacy form must be submitted no later than one academic quarter prior to degree conferral.

3. Submit a program consisting of at least 72 units, which contains a minimum of 57 technical course units. Of these 57 units, 42 must be taken as non-cross listed MSE courses. A maximum of 12 units of cross-listed MSE courses can be applied toward this requirement, and 9 units of non-MSE technical courses can be used. The 42 units of MSE courses must be taken for a letter grade. The remaining units may consist of research, seminars, language classes, and so on. The program for the M.S. and Ph.D. combined must include the following:
   a) MSE 201 through 209 (27 units), except for students who have had equivalent courses at other universities and have successfully petitioned out.
   b) A minimum of 12 units of 300-level courses from the MSE faculty (not including MSE 300).
   c) A minimum of 12 units of courses taken from one of the following lists of Advanced Specialty Courses (see below). Some and/or all of these courses can be the same as the courses used to meet requirement ‘3b’ above; however, the units may not be counted twice.
4. Maintain a GPA of 3.0 for all course work taken as a graduate student at Stanford.
5. Present the result of the dissertation at a department seminar immediately preceding the University Oral examination.

### Advanced Specialty Courses

Materials Characterization: Elect. Engr. 329, 331; MSE 320, 321, 322, 323, 324, 325
Synthesis and Processing Materials: Chem. Engr. 310A, 310B, 340, 345, 460; MSE 313, 315; Mech. Engr. 262A

### COURSES

(WIM) indicates that the course meets the Writing in the Major requirements. (AU) indicates that the course is subject to the University Activity Unit limitations (8 units maximum).

#### PRIMARILY FOR UNDERGRADUATES

50. Introductory Science of Materials—(Enroll in Engineering 50.)
   4 units, Win (Bravman)
   Spr (Sinclair)

100. Undergraduate Independent Study—Independent study in materials science under supervision of a faculty member.
   1-3 units, any quarter (Staff)

150. Undergraduate Research—Participation in a research project.
   3-6 units, any quarter (Staff)

151. Microstructure and Mechanical Properties—For undergraduates; see 251. Prerequisite: Engineering 50 or equivalent.
   3 units, Aut (Dauskardt)

152. Electronic Materials Engineering—Materials engineering for information technology applications. The fundamental electrical, optical, and magnetic properties of materials. Production of semiconductor

159Q. Stanford Introductory Seminar: Research in Japanese Companies—Preference to sophomores. The home-campus equivalent of the course taught at Kyoto. Knowledge from this research, and company visits, is evaluated in a seminar/discussion setting. Lecture/discussion on the structure of a Japanese company from the point-of-view of Japanese society. Visiting researchers from Japanese companies, with brief presentations and extensive question and answer periods, explore the Japanese research ethic.

3 units, Spr (McIntyre)

4 units, Aut (Doan)

4 units, Win (Doan)

163. Materials Science Lab III—For undergraduates. Lab on experimental techniques for the study of the mechanical properties of materials, including fracture toughness testing of metallic materials, ductile-to-brittle transition curves, fracture of ceramics using indentation techniques, and effects of grain size on yielding and strain hardening. Prerequisites: 198/208, 151/251, or equivalent.

4 units, Spr (Nix)

169Q. Stanford Introductory Seminar: Issues in Science and Christianity—Preference to sophomores. Insights as provided by modern science and the Christian perspective, and ways to integrate them. Seven patterns that have been used in the effort to describe the interaction between them. Consideration of contemporary issues such as creationism vs. evolution, determinism vs. free will, issues at the beginning and ending of life, and responsibility for the environment.

3 units, Win (Babe)

170. Materials Selection in Design—For undergraduates; see 270. Prerequisites: Engineering 14 and 50 or Mechanical Engineering 111.

3 units (Prinz) alternate years, given 2001-02

171. Materials Science Lab I—For graduates; see 161. Prerequisite: Engineering 50 or equivalent.

3 units, Aut (Doan)

172. Materials Science Lab II—For graduates; see 162. Prerequisite: 193/203.

3 units, Win (Doan)

173. Materials Science Lab III—For graduates; see 163. Prerequisites: 198/208, 151/251, or equivalent.

3 units, Spr (Nix)

179Q. Stanford Introductory Seminar: Materials in Sports—Preference to sophomores. Introduction to materials science using sporting equipment as a vehicle to highlight material properties, performance, and selection criteria. The classes of material, and the properties relevant to sporting equipment performance. Examples from modern sporting equipment (golf clubs, tennis rackets, skis, and bicycles) highlight the relationship between material properties and product performance.

3 units, Spr (McIntyre)

191. Mathematical and Computational Methods in Materials Science—For undergraduates; see 201. Prerequisite: familiarity with ordinary differential equations.

4 units, Aut (Barnett)

192. Solid State Thermodynamics—For undergraduates; see 202. Prerequisite: physical chemistry or introductory thermodynamics.

4 units, Aut (Musgrave)

193. Atomic Arrangements in Solids—For undergraduates; see 203.

4 units, Aut (Sinclair)

194. Phase Equilibria—For undergraduates; see 204. Prerequisite: 192/202.

4 units, Win (McIntyre)

195. Waves and Diffraction in Solids—For undergraduates; see 205. Prerequisite: 193/203 or consent of instructor.

4 units, Win (Clemens)

196. Imperfections in Crystalline Solids—For undergraduates; see 206. Prerequisite: 193/203.

4 units, Win (Nix)

197. Rate Processes in Materials—For undergraduates; see 207. Prerequisites: 191/201, 192/202, 194/204.

4 units, Spr (Clemens)

198. Mechanical Properties of Materials—For undergraduates; see 208. Prerequisites: 193/203, 196/206.

4 units, Spr (Dauskardt)

199. Electrical and Magnetic Properties of Solids—For undergraduates; see 209. Prerequisite: 195/205 or equivalent.

4 units, Spr (Wang)

PRIMARILY FOR GRADUATES

200. Master’s Research—Participation in a research project.

1-15 units, any quarter (Staff)

201. Mathematical and Computational Methods in Materials Science—Use of matrix and tensor analysis, with applications to the effects of crystal symmetry on physical property tensors related to elastic deformation, thermal expansion, diffusion, electricity and magnetism, piezoelectricity, and thermodynamics. Selected topics in elementary waves in solids, analytical and numerical solutions of the one-dimensional diffusion equation, or an introduction to the use of the calculus of variations. Assignments use Mathematica.

3 units, Aut (Barnett)

3 units, Aut (Musgrave)

203. Atomic Arrangements in Solids—Atomic arrangements in perfect and imperfect crystalline solids, defect chemistry, and elements of formal crystallography, including development of point groups and space groups.

3 units, Aut (Sinclair)
3 units, Win (McIntyre)

205. Waves and Diffraction in Solids—The elementary principals of x-ray, vibrational, and electron waves in solids. Basic wave behavior including Fourier analysis, interference, diffraction, and polarization. Examples of wave systems, including electromagnetic waves from Maxwell’s equations. Diffracted intensity in reciprocal space and experimental techniques such as electron and x-ray diffraction. Lattice vibrations in solids, including vibrational modes, dispersion relationship, density of states, and thermal properties. Free electron model. Basic quantum mechanics and statistical mechanics including Fermi-Dirac and Bose-Einstein statistics. Prerequisite: 193/203 or consent of instructor.
3 units, Win (Nix)

3 units, Win (Nix)

3 units, Spr (Clemens)

3 units, Spr (Dausskardt)

209. Electrical and Magnetic Properties of Solids—Introduction to the electronic, magnetic, optical, and ferroelectric properties of solids. Emphasis is on concepts and models of phonons and electronic energy bands as applied to metals, semiconductors, magnetic materials, and insulators. Elementary quantum and statistical mechanics concepts are utilized. Prerequisite: 195/205 or equivalent.
3 units, Spr (Wang)

1-15 units, any quarter (Staff)

227. Scattering Physics—(Enroll in Applied Physics 196.)
4 units, not given 2000-01

230. Materials Science Colloquium—Can be repeated for credit. (AU)
1 unit, Aut (Clemens, Barnett)
Win (Dausskardt, Sinclair)
Spr (McIntyre, Nix)

251. Microstructure and Mechanical Properties—Primarily for students without a materials background. Mechanical properties and their dependence on microstructure in a range of engineering materials.

3 units (Nix) alternate years, given 2001-02

260. Advanced Dislocation Theory—The mathematical theory of dislocations and how to apply it. Possible topics: elastic Green’s functions, formula of Volterra and Mura, specializing the results, self-energies of dislocations in 2-D and 3-D, interaction energies in elasticity, the Lothe-Brown formula; and forces on dislocation elements due to other dislocations, surfaces, and sources of applied stress.
3 units (Barnett) alternate years, given 2001-02

3 units (Prinz) alternate years, given 2001-02

299. Practical Training—Provides educational opportunities in high-technology research and development labs in industry. Qualified graduate students engage in internship work and integrate that work into their academic program. Following the internship, students complete a research report outlining their work activity, problems investigated, key results, and any follow-on projects they expect to perform. Meets the requirements for Curricular Practical Training for students on F-1 visas. Student is responsible for arranging own employment. See department Student Services Coordinator before enrolling. Can be repeated for credit.
1 unit, any quarter (Staff)

300. Ph.D. Research—Participation in a research project.
1-15 units, any quarter (Staff)

310. Integrated Circuit Fabrication Processes—(Enroll in Electrical Engineering 212.)
3 units, Aut (Plummer)

312. New Methods in Thin Film Synthesis—Techniques to grow thin films on an atomic scale provide the materials base for new classes of coatings and devices. The fundamentals of vacuum growth techniques, molecular beam epitaxy (MBE), chemical vapor deposition (CVD), ion beam assisted deposition, and plasma processes. Relationships between deposition parameters and film properties. Industrial applications of thin film synthesis.
3 units, Aut (Clemens)

313. Principles of Ceramics Processing—Fundamental description of the unit process operations used to fabricate polycrystalline ceramic components. Topics: grain growth, solid state and liquid phase sintering, drying, ceramic forming processes, beneficiation, introductory rheology, particle packing, size/shape effects, influence of processing additives, powder synthesis through solid state reactions and wet chemical methods. Prerequisites: 204 and 207, or their equivalents.
3 units, Aut (McIntyre) alternate years, not given 2001-02
315. Polymer Physics—(Enroll in Chemical Engineering 460.)
3 units, Spr (Frank) alternate years, not given 2001-02

316. Nanoscale Science, Engineering, and Technology—The techniques for patterning materials at the nanometer length scale: self-assembly, electron beam lithography, scanning probe lithography, and epitaxy. Electrical, optical, magnetic, chemical, and mechanical properties of nanostructured inorganic/organic hybrids, synthetic and biological supramolecules (e.g., dendrimers, liquid crystals, proteins, DNA), epitaxially grown films, nanoparticles, nanotubes, nanowires, self-assembled monolayers, and molecular wires. The hierarchical design of materials, molecular electronics, biomimetics, and scanning probe microscopy.
3 units, Aut (McGehee)

317. Advanced Integrated Circuit Fabrication—(Enroll in Electrical Engineering 311.)
3 units, Spr (Saraswat)

318. Integrated Circuit Fabrication Laboratory—(Enroll in Electrical Engineering 410.)
3-4 units, Win (Saraswat)

319. Electron and Ion Beams for Semiconductor Processing—(Enroll in Electrical Engineering 217.)
3 units, Spr (Pease) alternate years, not given 2001-02

3 units (Saraswat) alternate years, given 2001-02

321. Transmission Electron Microscopy—Image formation and interpretation. The contrast phenomena associated with perfect and imperfect crystals from a physical point of view and from a formal treatment of electron diffraction theory. The importance of electron diffraction to systematic analysis and recent imaging developments. Prerequisite: 193/203, 195/205, or equivalent.
3 units, Win (Saraswat)

322. Thin Film and Interface Microanalysis—The science and technology of a variety of microanalytical techniques, including Auger electron spectroscopy (AES), Rutherford backscattering spectroscopy (RBS), secondary ion mass spectroscopy (SIMS), ion scattering spectroscopy (ISS), and x-ray photoelectron spectroscopy (XPS or ESCA). Generic processes such as sputtering and high-vacuum generation. Prerequisite: some prior exposure to atomic and electronic structure of solids.
3 units, Aut (McGehee) alternate years, given 2001-02

323. Selected Topics in Thin Film Microcharacterization—Case-study characterizing materials, defining problems in characterizing surfaces or thin films, carrying out analyses of relevant samples, and reporting the results. Students operate modern electron, ion, and x-ray probe instruments to study samples. Methodology for approaching characterization problems; experience in interpreting and presenting experimental results. Emphasis is on the application of theoretical measurement capabilities to practical problems, and the capabilities and limitations of modern techniques. Topics: choosing the appropriate techniques, analytical pitfalls, quantitative analysis, effects of noise and other uncertainties on analytical precision. Enrollment limited. Prerequisite: 323 or consent of instructor.
3 units, Win (Saraswat) alternate years, not given 2001-02

324. X-Ray Diffraction—Diffraction theory and its relationship to structural determination in solids. Focus is on applications of x-rays; concepts can be applied to neutron and electron diffraction. Topics: Fourier analysis, kinematic theory, Patterson functions, diffraction from layered and amorphous materials, single crystal diffraction, dynamic theory, defect determination, surface diffraction, techniques for data analysis, and determination of particle size and strain. Prerequisites: 193/203, 195/205.
3 units (Clemens) alternate years, given 2001-02

325. Scattering Physics—(Enroll in Applied Physics 218.)
3 units, not given 2000-01

3 units (McIntyre) alternate years, given 2001-02

334. Basic Physics for Solid State Electronics—(Enroll in Electrical Engineering 228.)
3 units, Aut (J. Harris)

335. Properties of Semiconductor Materials—(Enroll in Electrical Engineering 327.)
3 units, Win (J. Harris)

336. Physics of Advanced Semiconductor Devices—(Enroll in Electrical Engineering 328.)
3 units, alternate years, given 2001-02

341. Principles and Models of Semiconductor Devices—(Enroll in Electrical Engineering 216.)
3 units, Aut (Saraswat)

342. The Electronic Structure of Surfaces and Interfaces—(Enroll in Electrical Engineering 329.)
3 units, Aut (Pianetta) alternate years, not given 2001-02

3 units, Spr (McGehee)
348. Principles of Magnetic Recording—Fundamental understanding and applications of magnetic recording. Read and write processes, inductive and MR and GMR heads, thin film and particular media, medium and head noise, head-media interface. Technology trends and recording system issues introduced. Prerequisite: 347 or equivalent or consent of instructor.

3 units, Aut (Wang) alternate years, not given 2001-02

349. Introduction to Information Storage Systems—(Enroll in Electrical Engineering 335.)

3 units, Win (Wang)

350. Micromechanics—Use of the theory of elasticity to discuss fields of dislocations, inclusions, inhomogeneities, and their interactions in deformable solids. Applications to the microscopic foundations of macrosopic plasticity, the effects of strain energy on morphologies associated with phase transformations, and the determination of “effective” properties of composite media. Prerequisite: any brief introduction to the theory of elasticity, or consent of instructor.

3 units, Win (Barnett)

351. Microstructural Design of Advanced Materials and Composites—Strategies for the control of mechanical properties through microstructural design in a range of engineering materials and their composites. Emphasis is on a fracture mechanics description of strengthening and toughening methods in advanced ceramics and various composites. The structural reliability of brittle materials systems and their relationship to microstructure and processing in terms of fracture statistics, and long-term properties in terms of subcritical crack-growth processes with examples and applications, including cyclic fatigue and high-temperature creep of metals and ceramics. Prerequisites: basic understanding of materials microstructure, mechanical properties, and fracture mechanics; 251 and 358, or equivalents.

3 units, Spr (Dauskardt)

352. Stress Analysis of Thin Films and Layered Composite Media—Introduction to methods of stress analysis of layered dissimilar media, including thin films deposited on substrates, composite laminates, and stratified anisotropic elastic materials based on techniques pioneered by Stroh. Stress states generated by thermal and elastic mismatch and local stress concentrations at interfacial cracks or corners with applications to integrated circuit devices, aircraft materials, and geophysical media. Prerequisites: introductory course on the strength of materials or the theory of elasticity, some familiarity with matrix algebra.

3 units, Win (Barnett) alternate years, not given 2001-02

3 units (Nix) alternate years, given 2001-02

354A. Theory and Applications of Elasticity—(Enroll in Mechanical Engineering 240A.)

3 units, Win (Gao)

354B. Introduction to Fracture Mechanics—(Enroll in Mechanical Engineering 240B.)

3 units, Spr (Gao)

355. Time-Dependent Plasticity—Theories and mechanisms of creep. Temperature and strain rate effects on the plastic flow of solids. The relation of high temperature strength and ductility of materials to structure. Prerequisite: 198/208.

3 units (Nix) alternate years, not given 2001-02

356. Fatigue Design and Analysis—(Enroll in Mechanical Engineering 245.)

3 units, Win (Nelson)

357. Physical Solid Mechanics—(Enroll in Mechanical Engineering 229.)

3 units, Spr (Cho)

3 units, Win (Dauskardt)

359. Crystalline Anisotropy—Introductory matrix and tensor analysis with applications to the effects of crystal symmetry on elastic deformation, thermal expansion, diffusion, piezoelectricity, magnetostriction, and thermodynamics, following a treatment at the level of Nye's text. Homework sets use Mathematica™.

3 units (Barnett) alternate years, not given 2001-02

360. Techniques of Failure Analysis—(Enroll in Aeronautics and Astronautics 252.)

2 units, Spr (Ross)

361. Mechanics of Composites—(Enroll in Aeronautics and Astronautics 256.)

3 units, Win (Springer)

400. Participation in Materials Science Teaching—Can be repeated for credit.

1-3 units, Aut, Win, Spr (Staff)

405. Seminar in Applications of Transmission Electron Microscopy—Can be repeated for credit. (AU)

1 unit, Aut, Win, Spr (Sinclair)

459. Frontiers in Interdisciplinary Biosciences—Cross-listed in multiple departments in the schools of Humanities and Sciences, Engineering, and Medicine; students should enroll directly through their affiliated department, if at all possible. Introduction to cutting-edge research involving interdisciplinary approaches to bioscience and biotechnology; for specialists and non-specialists. Associated with Stanford’s Clark Center for Interdisciplinary Bioscience, and held in conjunction with a seminar series meeting twice monthly during 2000-01. Leading investigators from Stanford and throughout the world speak on their research; students also meet separately to present and discuss the ever-changing subject matter, related literature, and future directions. Prerequisite: keen interest in all of science, with particular interest in life itself. Recommended: basic knowledge of biology, chemistry, and physics.

2 units, Aut, Win, Spr (S. Block)
MECHANICAL ENGINEERING

Chair: Ronald K. Hanson

Associate Chair for Student Services: M. Godfrey Mungal

Associate Chair for Faculty Affairs: Mark R. Cutkosky

Associate Chair for Graduate Curriculum and Admissions: Parviz Moin

Division Chairs: Thomas F. Andriacchi, Scott Delp (co-chairs, Biomechanical Engineering), Mark Cappelli, (Thermosciences Division), Thomas J. R. Hughes (Mechanics and Computation); (the Design Division, and the Flow Physics and Computation Division operate without a chair)

Laboratory Directors: David W. Beach (Program Director, Manufacturing Systems Engineering and Product Realization Laboratory), J. Edward Carryer (Smart Product Design Laboratory), Mark R. Cutkosky (Manufacturing Sciences Lab and Manufacturing Models Laboratory), Dennis R. Carter (Veterans Affairs Rehabilitation R&D Center), John K. Eaton (Heat Transfer and Turbulence Mechanics), Larry J. Leifer (Center for Design Research and Stanford Learning Lab), Reginald E. Mitchell (High Temperature Gasdynamics), Parviz Moin (Center for Turbulence Research), Friedrich B. Prinz (Rapid Prototyping Laboratory)

Associate Professors: Mark A. Cappelli, Scott L. Delp, Rolf A. Faste, Kenneth E. Goddard, Kosuke Ishii, David M. Kelley, Thomas W. Kenny, Sanjiva Lele, Reginald E. Mitchell, Sheri D. Shappard

Assistant Professors: Kyeongjae Cho, Christopher Edwards, J. Christian Gerdes, Jean H. Hegarda, Juan G. Santiago

Professors (Research): Richard Christensen, Paul Durbin, Kenneth Waldron, Kenneth Waldron, Felix E. Zajac

Professor (Teaching): David W. Beach

Courtesy Professors: George S. Springer, Paul Yock

Consulting Associate Professor: Fu-Ruo Chang

Honorary Professor (Research): Charles A. Taylor

Senior Lecturer: J. Craig Milroy

Lecturers: Eugene Alexander, Michael Barry, Albert Makino, Neal Moore, Richard Neptune, Matthew R. Ohline, Robert E. Smith, Nancy Squires

Consulting Associate Professors: J. Edward Carryer, Brent Constantz, Paul Mitiguy, Carol B. Muller, Sunil Puria

Consulting Assistant Professors: Michael Barry, Brendan J. Boyle, William Burnett, Sara Little Turnbull, Scott Yerby

Visiting Professors: Dick Desautel, Javier Jimenez, Darryl Thenlen

Visiting Assistant Professor: B. Gurumoorthy

Visiting Assistant Professor: Darryl Thenlen

The programs in the Department of Mechanical Engineering (ME) are designed to provide background for a wide variety of careers. The discipline is very broad, and is generally understood to emphasize an appropriate mix of applied mechanics, biomechanical engineering, computer simulations, design, and energy science and technology. Graduates at all degree levels have traditionally entered into energy industries, product manufacturing industries, transportation, government laboratories and agencies dealing with these problems, and a variety of academic positions.

Since mechanical engineering is a broad discipline, the undergraduate program can be a springboard for graduate study in business, law, medicine, political science, and other professions where a good understanding of technology is often important. Both undergraduate and graduate programs provide excellent technical background for work in biomechanical engineering, environmental pollution control, ocean engineering, transportation, and on other multidisciplinary problems that concern our society. Throughout the various programs, considerable emphasis is placed on developing systematic procedures for analysis, effective communication of one's work and ideas, practical and aesthetic aspects in design, and responsible use of technology. This can provide a student with an approach and a philosophy of great utility, irrespective of an ultimate career.

The department has five divisions: Biomechanical Engineering, Design, Flow Physics and Computation Division (jointly with the Department of Aeronautics and Astronautics), Mechanics and Computation, and Thermosciences. Each maintains its own labs, shops, and offices.

The Biomechanical Engineering (BME) Division has teaching and research activities which focus primarily on musculoskeletal biomechanics, neuromuscular biomechanics, cardiovascular biomechanics, and rehabilitation engineering. Research in other areas including hearing, ocean, plant, and vision biomechanics exist in collaboration with associated faculty in biology, engineering, and medicine. The Biomechanical Engineering Division has particularly strong research interactions with the Mechanics and Computation Division, the Design Division, and the departments of Functional Restoration, Radiology, and Surgery in the School of Medicine.

The Design Division emphasizes cognitive skill development for creative design. It is concerned with automatic control, computer-aided design, creativity, design aesthetics, design research, experimental stress analysis, fatigue and fracture mechanics, finite element analysis, human factors, kinematics, manufacturing systems, microcomputers in design, micro-electromechanical systems (MEMS), optimization, design for manufacturability, and robotics. The Design Division offers undergraduate and graduate programs in Product Design (jointly with the Department of Art and Art History). The division offers a master's program in Manufacturing Systems Engineering jointly with the Department of Management Science and Engineering, and the Graduate School of Business.

The Flow Physics and Computation Division (FPC) is a joint laboratory of the departments of Aeronautics and Astronautics, and Mechanical Engineering. FPC is contributing new theories, models and computational tools for accurate engineering design analysis and control of complex flows (including acoustics, chemical reactions, interactions with electromagnetic waves, plasmas, and other phenomena) of interest in aerodynamics, electronics cooling, environment engineering, materials processing, planetary entry, propulsion and power systems, and other areas. A significant emphasis of FPC research is on physical modeling and analysis of physical phenomena in engineering systems. FPC students and research staff are developing new methods and tools for generation, access, display, interpretation and post-processing of large databases resulting from numerical simulations of physical systems. Research in FPC ranges from advanced simulation of complex turbulent flows to active flow control. The FPC faculty teach graduate and undergraduate courses in acoustics, aerodynamics, computational fluid mechanics, computational mathematics, fluid mechanics, combustion, and thermodynamics and propulsion.

The Mechanics and Computational Division covers biomechanics, continuum mechanics, dynamics, experimental and computational mechanics, finite element analysis, fluid dynamics, fracture mechanics, micro mechanics, nanotechnology, and simulation based design. Qualified students can work as research project assistants, engaging in thesis research in working association with the faculty director and fellow students. Projects include analysis, synthesis, and control of systems; biomechanics; flow dynamics of liquids and gases; fracture and micro-mechanics, vibrations, and nonlinear dynamics; and original theoretical.
computational, and experimental investigations in the strength and deformability of elastic and inelastic elements of machines and structures.

The Thermosciences Division offers courses and specialized work in applied thermodynamics, combustion, energy systems, fluid mechanics, gas physics and chemistry, heat transfer, laser diagnostics, materials processing, plasma sciences, propulsion, and sensors.

**Mission Statement**—The goal of Stanford’s undergraduate program in Mechanical Engineering is to provide each student with a balance of intellectual and practical experiences, accumulation of knowledge, and self-discovery in order to prepare the graduate to address a variety of societal needs. The program prepares each student for entry-level work as a mechanical engineer, for graduate study in engineering, or for graduate study in another field where a broad and fundamental engineering background provides a desirable foundation. With solid grounding in the principles and practice of mechanical engineering, graduates are ready to engage in a lifetime of learning about and employing new concepts, technologies, and methodologies, whatever their ultimate career choice.

**FACILITIES**

The department divisions maintain modern laboratories that support undergraduate and graduate instruction and graduate research work.

The Structures and Composites Laboratory, a joint activity with the Department of Aeronautics and Astronautics, studies structures made of fiber-reinforced composite materials. Equipment for fabricating structural elements include autoclave, filament winder, and presses. X-ray, ultrasound, and an electron microscope are available for nondestructive testing. The lab also has environmental chambers, a high speed impactor, and mechanical testers. Lab projects include designing composite structures, developing novel manufacturing processes, and evaluating environmental effects on composites.

Experimental facilities are available through the interdepartmental Structures and Solid Mechanics Research Laboratory, which includes an electrohydraulic materials testing system, a vehicle crash simulator, and a shake table for earthquake engineering and related studies, together with highly sophisticated auxiliary instrumentation. Facilities to study the micromechanics of fracture areas are available in the Micromechanics/Fracture Laboratory, and include a computer controlled materials testing system, a long distance microscope, an atomic force microscope, and other instrumentation. Additional facilities for evaluation of materials are available through the Center for Materials Research, Center for Integrated Circuits, and the Ginzton Laboratory. Laboratories for biological experimentation are available through the School of Medicine. Individual accommodation is provided for the work of each research student.

Many Biomechanical Engineering Division activities and resources are associated with the Rehabilitation Research and Development Center of the Veterans Administration Palo Alto Health Care System. This major national research center has computational and prototyping facilities. In addition, the Rehabilitation Research and Development Center houses the Electrophysiology Laboratory, Experimental Mechanics Laboratory, Human Motor Control Laboratory, Rehabilitation Device Design Laboratory, and Skeletal Biomechanics Laboratory. These facilities support graduate course work as well as Ph.D. student research activities.

Computational and experimental work is also conducted in various facilities throughout the School of Engineering and the School of Medicine, particularly in the Advanced Biomaterials Testing Laboratory of the Department of Material Science and Engineering, the Orthopaedic Research Laboratory in the Department of Functional Restoration, and the Vascular Research Laboratory in the Department of Surgery. In collaboration with the School of Medicine, biologically and clinically oriented work is conducted in various facilities throughout the Stanford Medical Center and the Veterans Administration Palo Alto Health Care System.

The Design Division has facilities for lab work in experimental mechanics and experimental stress analysis. Additional facilities, including MTS electrohydraulic materials test systems, are available in the Solid Mechanics Research Laboratory. Design Division students also have access to Center for Integrated Systems (CIS) and Ginzton Lab microfabrication facilities.

The division also maintains the Product Realization Laboratory, a teaching facility offering students integrated experiences in market definition, product design, and prototype manufacturing. The PR Lab provides coaching, design and manufacturing tools, and networking opportunities to students interested in product development. The ME 310 Design Project Laboratory has facilities for CAD, assembly, and testing of original designs by master’s students in the engineering design program. A Smart Product Design Laboratory supports microprocessor application projects. The Center for Design Research (CDR) has an excellent facility for concurrent engineering research, development, and engineering curriculum creation and assessment. Resources include a network of high-performance workstations. For World Wide Web mediated concurrent engineering by virtual, non-colocated, design-development teams, see the CDR URL (http://cdr.stanford.edu). In addition, CDR has several industrial robots for student projects and research. These and several NC machines are part of the CDR Manufacturing Sciences Lab. The Manufacturing Modeling Laboratory (MML) addresses various models and methods that lead to competitive manufacturing. MML links design for manufacturing (dfm) research at the Department of Mechanical Engineering with supply chain management activities at the Department of Management Science and Engineering. The Rapid Prototyping Laboratory consists of seven processing stations including clearing, CNC milling, grit blasting, laser deposition, low temperature deposition, plasma deposition, and shot peening. Students gain experience by using ACIS and Pro Engineer on Hewlett Packard workstations for process software development. The Design Division also has a unique “Product Design Loft,” in which students in the joint program in Design develop graduate thesis projects.

Flow Physics and Computation Division has a 32 processor Origin 2000 super computer and an array of powerful workstations for graphics and advanced data analysis. FPC is strongly allied with the Center for Turbulence Research (CTR), a research consortium between Stanford and NASA, and the Center for Integrated Turbulence Simulations (CITS), which is supported by the Department of Energy (DOE) under its Accelerated Strategic Computing Initiative (ASCI). The Center for Turbulence Research has direct access to major national computing facilities located at the nearby NASA-Ames Research Center, including massively parallel super computers. The Center for Integrated Turbulence Simulations has access to DOE’s vast supercomputer resources. The intellectual atmosphere of the Flow Physics and Computation Division is greatly enhanced by the interactions among CTR’s and CITS’s staff of postdoctoral researchers and distinguished visiting scientists.

The Mechanics and Computation Division has a Computational Mechanics Laboratory that provides an integrated computational environment for research and research-related education in computational mechanics and scientific computing. The laboratory houses Silicon Graphics, Sun, and HP workstations and servers, including an 8-processor SGI Origin2000 and a 16-processor networked cluster of Intel-architectured workstations for parallel and distributed computing solution of computationally intensive problems. A wide spectrum of software is available on the laboratory machines, including major commercial packages for engineering analysis, parametric geometry and meshing, and computational mathematics. The laboratory supports basic research in computational mechanics as well as the development of related applications such as simulation-based design technology.

The Thermosciences Division has two major labs. The Heat Transfer and Turbulence Mechanics (HTTM) Laboratory concentrates on fundamental research aimed at understanding and improved prediction of turbulent flows and thermal and fluid sciences at the microscales. The High Temperature Gas-Dynamics Laboratory (HTGL) is engaged in research activities in combustion, laser-based diagnostics and sensors, plasma sciences, pollutant formation, and reactive and non-reactive gas dynamics. The experimental capability of the HTGL includes a central laboratory computer with dedicated minicomputers, diagnostic devices for combustion gases, a spray combustion facility, laboratory combustors including a coal combustion facility and supersonic combustion
facilities, several advanced laser systems, a variety of plasma facilities, a pulsed detonation facility, and four shock tubes and tunnels. The Thermosciences and Design Division share the Microscale Thermal and Mechanical Characterization laboratory (MTMC). MTMC is dedicated to the measurement of thermal and mechanical properties in thin-film systems, including microfabricated sensors and actuators and integrated circuits, and features a nanosecond scanning laser thermometry facility, a laser interferometer, a near-field optical microscope, and an atomic force microscope. The activities at MTMC are closely linked to those at the Heat Transfer Teaching Laboratory (HTTTL), where undergraduate and master’s students use high-resolution probe stations to study thermal phenomena in integrated circuits and thermally-actuated microvalves. HTTTL also provides macroscopic experiments in convection and radiative exchange.

Guidance and Control Laboratory, a joint activity with the Department of Aeronautics and Astronautics and the Department of Mechanical Engineering, specializes in construction of electromechanical systems and instrumentation, particularly where high precision is a factor. Work ranges from robotics for manufacturing to feedback control of fuel injection systems for automotive emission control. The faculty and staff work in close cooperation with both the Design and Thermosciences Divisions on device development projects of mutual interest.

Many computation facilities are available to department students. Three of the department’s labs are equipped with super-minicomputers. Numerous smaller minicomputers and microcomputers are used in the research and teaching laboratories. Library facilities at Stanford are outstanding. In addition to the general library, there are Engineering, Mathematics, Physics, and other department libraries of which engineering students make frequent use.

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

Specializing in mechanical engineering (ME) during the undergraduate period may be done by following the curriculum outlined earlier under the “School of Engineering” section of this bulletin. The University’s basic requirements for the bachelor’s degree are discussed in the “Undergraduate Degrees” section of this bulletin. Courses taken for the departmental major (math; science; science, technology, and society; engineering fundamentals; and engineering depth) must be taken for a letter grade if the instructor offers the option.

A Product Design program is offered by the Design Division and leads to the B.S. Engineering (Product Design). An individually designed major in Biomechanical Engineering (B.S.E.: Biomechanical Engineering), offered by the Biomechanical Engineering Division, may be appropriate for some students preparing for medical school or graduate bioengineering studies.

Grade Requirements—To be recommended by the department for a B.S. in Mechanical Engineering, a student must achieve the minimum grade point average (GPA) set by the School of Engineering (2.0 in engineering fundamentals and engineering depth).

For information about an ME minor, see the “School of Engineering” section of this bulletin.

COTERMINAL B.S. /M.S. PROGRAM

Stanford undergraduates who wish to continue their studies for the Master of Science degree in the coterminal program should apply for entrance after the beginning of the eighth quarter of undergraduate work and before the end of the 11th quarter. The application must provide evidence of potential for strong academic performance as a graduate student. The application is evaluated and acted on by the graduate admissions committee of the department. Typically, a GPA of at least 3.25 in engineering, science, and math is expected. Applicants must have completed two of 111, 112, 113, 131A, 131B, 131C, and must take the Graduate Record Examination (GRE) before action is taken on the application. Product designers must have completed 116A to be considered, and are required to work at least one year before rejoining the program. Co-terminal information and forms can be obtained from the ME Student Services office.

GRADUATE PROGRAMS

ADMISSION AND FINANCIAL ASSISTANCE

To be eligible for admission to the department, a student must have a B.S. degree in engineering (the Ph.D. degree requires the completion of the M.S.), physics, or a comparable science program. Applications for all degree programs are accepted throughout the year, although applications for fellowship aid must be received by January 14. The department annually awards, on a competitive basis, a limited number of fellowships, teaching assistantships, and research assistantships to incoming graduate students. Research assistantships are used primarily for post-master’s degree students and are awarded by individual faculty research supervisors, not by the department. Preference for teaching assistantships is generally given to students who obtain the bachelor’s or master’s degree at Stanford.

Mechanical engineering is a varied profession, ranging from primarily aesthetic aspects of design to highly technical scientific research. Discipline areas of interest to mechanical engineers include biomechanics, energy conversion, fluid mechanics, materials, nuclear reactor engineering, propulsion, rigid and elastic body mechanics, systems engineering, scientific computing, and thermodynamics, to name a few. No mechanical engineer is expected to have a mastery of the entire spectrum.

Master’s degree programs are offered in Mechanical Engineering (M.S.: ME), Engineering (Manufacturing Systems Engineering, M.S.E.: MSE), Engineering (Biomechanical Engineering, M.S.E.: BME), Engineering (Product Design, M.S.E.: PD), and Engineering (M.S.E.).

The following sections list specific requirements for the master’s degrees listed above.

MASTER OF SCIENCE

The basic University requirements for the M.S. degree are discussed in the “Graduate Degrees” section of this bulletin.

The master’s program normally consists of three quarters of full-time course work. No thesis is required, although many students become involved in research projects during the master’s year, particularly to explore their interests in working for the Ph.D. degree. Students whose undergraduate backgrounds are entirely devoid of some of the major subject disciplines of engineering (for example, applied mechanics, applied thermodynamics, fluid mechanics, ordinary differential equations) may need to take some undergraduate courses to fill in obvious gaps and prepare themselves to take graduate courses in these areas. Such students may require more than three quarters to fulfill the master’s degree requirements, as the make-up courses may not be used for other than the unrestricted electives (see item '4' below) in the M.S. degree program. However, it is not the policy to require fulfillment of mechanical engineering B.S. degree requirements in order to obtain an M.S. degree; furthermore, students who have already fulfilled certain categories of the M.S. degree requirements as a result of undergraduate work may find they have sufficient time (see item ‘3’ below) to obtain the M.S. degree in the normal three quarters.

MECHANICAL ENGINEERING

The master’s degree program requires 45 units of course work taken as a graduate student. At least 36 of the units must be taken at Stanford; any units transferred from other universities (up to 9 are allowed) must be in graduate-level courses taken while registered as a graduate student and may not be applied toward fulfillment of item '2' below. No thesis is required. However, students who desire some research experience during the master’s year may participate in research through ME 290, 291, and 292.

The department’s requirements for the M.S. in Mechanical Engineering are:
1. Mathematical Competence in Two of the Following Areas: complex variables, linear algebra, modern algebra, numerical analysis, partial differential equations, statistics, or vector and tensor analysis, as
demonstrated by completion of two courses from Computer Science 137, 205, 237A,B,C; Mathematics 106, 109, 113, 131, 132; ME 200-208; Statistics 110, 161. Requirement: 6 units.

Students who completed comparable graduate-level courses as undergraduates and who can demonstrate their competence to instructors may be exempted from this requirement by their advisers and the ME Student Services office, and place the units in the approved elective category.

2. Eighteen units of graduate-level courses in ME consisting of:
   a) A Specialty in Mechanical Engineering: a set of graduate-level courses in mechanical engineering to provide depth in one area. These sets have been approved by the faculty as providing depth in specific areas as well as a significant component of applications of the material in the context of engineering synthesis. These courses are listed in the Mechanical Engineering Graduate Handbook.
   b) Breadth in Mechanical Engineering: at least two additional graduate-level courses outside the depth area to bring the total number to at least 18 ME units in courses numbered 207 and above, excluding 290-301 and math courses. Courses 200-206, 288-301, and 311 may not be counted in these categories.

3. Approved Electives: to bring the total number of units to 39: all these units must have adviser approval. Graduate engineering, math, and science courses are normally approved, and upper-level undergraduate courses may be approved if consistent with the student’s objectives. Of the 39 units, no more than 6 may come from ME 291 and 292, and no more than 3 may come from the other courses numbered 290-299 or other seminars. Students planning a Ph.D. degree should discuss with their adviser the desirability of taking 291 or 292 during the master’s year.

4. Unrestricted Electives: to bring the total number of units submitted for the M.S. degree to 45: students are encouraged to use these units outside of engineering, mathematics, or the sciences. Students should consult their advisers on course loads and on ways to use the unrestricted electives to make a manageable program.

5. Within the courses satisfying the requirements above, there must be at least one graduate-level course dealing with lab studies. Courses which satisfy this requirement are 207A,B, 217B, 218A, 224, 225A, 226B, 248, 254, 267, 282A, 282B, 303, 310A,B,C.

Candidates for the M.S. in Mechanical Engineering are expected to have the approval of the faculty, and a minimum grade point average (GPA) of 2.75 in the 45 units presented in fulfillment of degree requirements. All courses used to fulfill requirements 1, 2, 3, and 5 above must be graded (excluding seminars and courses for which a Satisfactory/No Credit grade is given to all students).

Students falling below a GPA of 2.5 at the end of 20 units may be disqualified from further registration. Students failing to meet the complete degree requirements at the end of 60 units of graduate registration are disqualified from further registration. Courses used to fulfill deficiencies arising from inadequate undergraduate preparation for mechanical engineering graduate work may not be applied to the 60 units required for graduate registration.

PRODUCT DESIGN

The focus of the Joint Program in Design is the intersection of technology with human needs and aspirations. This program is a joint offering of the Department of Mechanical Engineering and the Department of Art and Art History. The resulting two-year degree of MS in Engineering (Product Design) is considered a terminal degree for the practice of design.

Free Electives† |
Total | 60

* Taken jointly each quarter.
† These electives allow a student to pursue studies suited to personal needs. A list of pre-approved product design electives is outlined in the Mechanical Engineering Graduate Handbook.

Note: Students with Bachelor’s degrees held to the program design a 45-unit program with their adviser.

Admission requirements are the same as for the M.S.:ME described above, with the additional requirements of a minimum of one year’s experience after the bachelor’s degree, and a portfolio showing strong evidence of design ability and aesthetic skills and sensitivity.

Students with non-engineering undergraduate degrees in design, art, architecture, etc., may apply to the Department of Art and Art History for a similar graduate design program administered by that department and leading to an M.F.A. in Design. Students with non-engineering degrees who wish to earn the M.S. degree should consult with the program adviser.

MANUFACTURING SYSTEMS ENGINEERING

The M.S. in Engineering (Manufacturing Systems Engineering) addresses the need for engineers who combine management and design skills focused on manufacturing. There is a critical need for individuals who can deal directly with product design for manufacturability; design of manufacturing tools; financial, organizational, and strategic management issues; and elements of automation technology such as computer-aided design, computer-aided manufacturing robotics, and microprocessor control.

Manufacturing Systems Engineering (MSE) is offered jointly by two departments: Mechanical Engineering, and Management Science and Engineering. The program seeks high-quality students with strong educational backgrounds in engineering and provides a demanding curriculum strong in both hardware aspects and engineering management. Students must apply directly to the MSE program by submitting an application to the Department of Mechanical Engineering.

The hardware and engineering-design aspects of the program include:

| ME 207A,B. Integrated Design in Marketing and Manufacturing |
| ME 217A,B. Design for Manufacturability |
| ME 218A,B,C. Smart Product Design |
| ME 310A. Tools for Team-Based Design |
| ME 310B,C. Design Project Experience with Corporate Partners |
| ME 313. Ambidextrous Thinking |
| ME 319. Robotics and Vision Lab |

The engineering management subjects include:

| Manage. Sci. & Engr. 203. Organization Behavior and Management |
| Manage. Sci. & Engr. 225. Manufacturing Systems Design |
| Manage. Sci. & Engr. 261. Inventory Control and Production Systems |
| Manage. Sci. & Engr. 262. Supply Chain Management |
| Manage. Sci. & Engr. 266. Management of New Product Development |
| Manage. Sci. & Engr. 268. Manufacturing Strategy |
| Manage. Sci. & Engr. 269. Marketing for Technology-Based Companies |

Hardware and engineering design courses provide hands-on knowledge of these functions and the trade-offs that must be made to take advantage of the relationships between design and manufacturing. Engineering management subjects provide a suitable perspective for evaluating alternative financial, organizational, and production systems as well as a firm’s manufacturing policy.

Beyond the required core, the curriculum allows for choice from a broad set of relevant electives to provide additional training in engineering management and engineering design hardware. Here a student may tailor the program to meet individual interests and needs.

Students in the MSE program must have faculty approval and a minimum GPA of 3.0 in the 45 units presented in fulfillment of the degree requirements.

DUAL M.S.E. AND M.B.A. PROGRAM

Students interested in a career focused on manufacturing management and product development may apply for the dual Manufacturing Systems Engineering and Master of Business Administration Program. Minimum requirements can be met through seven quarters of study if the candidate
matriculates to both programs simultaneously. For additional information, contact the MSE Design Division Office.

BIOMECHANICAL ENGINEERING

Students interested in graduate studies in biomechanical engineering can choose one of the programs below.

1. **M.S. in Mechanical Engineering**: students who apply and are admitted to the M.S./ME program can elect to take biomechanical engineering courses as part of their M.S./ME requirements. These courses are usually applied towards the student's engineering breadth or technical electives.

2. **M.S. in Engineering: Biomechanical Engineering (M.S.E.:BME)**: this degree program allows students more flexibility in taking courses in the life sciences and generally emphasizes a more interdisciplinary curriculum. Minimum grade point average (GPA) requirements are the same as for the M.S. in Mechanical Engineering.

A Ph.D. in Biomechanical Engineering is not given. Students from either master's degree path (Mechanical Engineering or Biomechanical Engineering) receive their Ph.D. degrees in Mechanical Engineering. The Ph.D. qualifying examinations are flexible enough to accommodate students with either master's degree preparation.

ENGINEERING

As described in the “School of Engineering” section of this bulletin, each department in the school may sponsor students in a more general degree, the M.S. in Engineering. Sponsorship by the Department of Mechanical Engineering (ME) requires (1) filling a petition for admission to this program on the day before instruction begins, and (2) that the center of gravity of the proposed program lies in ME; no more than 18 units used for the proposed program can have been previously completed. The program must include at least 9 units of graduate-level work in the department other than ME 200-206 and 288, 290-297, 301, 311. The petition must be accompanied by a statement explaining the program objectives and how it is coherent, contains depth, and fulfills a well-defined career objective. The grade requirements are the same as for the M.S. in Mechanical Engineering.

POST-MASTER'S DEGREE PROGRAMS

The department offers two post-master's degrees: Engineer and Doctor of Philosophy. Post-master's research generally requires some evidence that a student has research potential before a faculty member agrees to supervision and a research assistantship. It is most efficient to carry out this preliminary research effort during the M.S. degree year.

ENGINEER

The basic University requirements for the degree of Engineer are discussed in the “Graduate Degrees” section of this bulletin. This degree represents an additional year of study beyond the M.S. degree and includes a research thesis. The program is designed for students who wish to do professional engineering work upon graduation and who want to engage in more specialized study than is afforded by the master's degree alone.

Admission standards are substantially the same as indicated under the master's degree. However, since thesis supervision is required and the availability of thesis supervisors is limited, admission is not granted until the student has personally engaged a faculty member to supervise a research project. This frequently involves a paid research assistantship awarded by individual faculty members (usually from the funds of sponsored research projects under their direction) and not by the department. Thus, personal arrangement is necessary. Students studying for the M.S. degree at Stanford and desiring to continue to the Engineer degree ordinarily make such arrangements during the M.S. degree year. Students holding master's degrees from other universities are invited to apply and may be admitted providing they are sufficiently well qualified and have made thesis supervision and financial aid arrangements.

Department requirements for the degree include an acceptable thesis; up to 18 units of credit are allowed for thesis work. In addition to the thesis, 27 units of approved advanced course work in mathematics, science, and engineering are expected beyond the requirements for the M.S. degree; the choice of courses is subject to approval of the adviser. Students who have not fulfilled the Stanford M.S. degree requirements are required to do so (with allowance for approximate equivalence of courses taken elsewhere).

Candidates for the degree must have faculty approval and have a minimum grade point average (GPA) of 3.0 for all courses (exclusive of thesis credit) taken beyond those required for the master's degree.

DOCTOR OF PHILOSOPHY

The basic University requirements for the Ph.D. degree are discussed in the “Graduate Degrees” section of this bulletin. The Ph.D. degree is intended primarily for students who desire a career in research, advanced development, or teaching; for this type of work, a broad background in math and the engineering sciences, together with intensive study and research experience in a specialized area, are the necessary requisites.

A Ph.D. degree is not given. Students from either master's degree path (Mechanical Engineering or Biomechanical Engineering) receive their Ph.D. degrees in Mechanical Engineering. The Ph.D. qualifying examinations are flexible enough to accommodate students with either master's degree preparation.

The basic University requirements for the degree of Engineer are discussed in the “Graduate Degrees” section of this bulletin. This degree represents an additional year of study beyond the M.S. degree and includes a research thesis. The program is designed for students who wish to do professional engineering work upon graduation and who want to engage in more specialized study than is afforded by the master's degree alone.

Admission standards are substantially the same as indicated under the master's degree. However, since thesis supervision is required and the availability of thesis supervisors is limited, admission is not granted until the student has personally engaged a faculty member to supervise a research project. This frequently involves a paid research assistantship awarded by individual faculty members (usually from the funds of sponsored research projects under their direction) and not by the department. Thus, personal arrangement is necessary. Students studying for the M.S. degree at Stanford and desiring to continue to the Engineer degree ordinarily make such arrangements during the M.S. degree year. Students holding master's degrees from other universities are invited to apply and may be admitted providing they are sufficiently well qualified and have made thesis supervision and financial aid arrangements.

Department requirements for the degree include an acceptable thesis; up to 18 units of credit are allowed for thesis work. In addition to the thesis, 27 units of approved advanced course work in mathematics, science, and engineering are expected beyond the requirements for the M.S. degree; the choice of courses is subject to approval of the adviser. Students who have not fulfilled the Stanford M.S. degree requirements are required to do so (with allowance for approximate equivalence of courses taken elsewhere).

Candidates for the degree must have faculty approval and have a minimum grade point average (GPA) of 3.0 for all courses (exclusive of thesis credit) taken beyond those required for the master's degree.
The Ph.D. thesis normally represents at least one full year of research work and must be a substantial contribution to knowledge. Students may register for course credit for thesis work (ME 301) to help fulfill University residence requirements, but there is no minimum limit on registered dissertation units. Candidates should note that University residence requirements (see the "Graduate Degrees" section of this bulletin) are expressed in terms of equivalent full-time registration and not in terms of units per se; questions on this should be addressed to the manager of Student Services.

The department has a breadth requirement for the Ph.D. degree. This may be satisfied either by a formal minor in another department or by course work that is approved by the dissertation reading committee.

The final University oral examination is conducted by a committee consisting of a chair from another department and four faculty members of the department or departments with related interests. Usually, the committee includes the candidate’s adviser and two faculty members chosen to read and sign the candidate’s dissertation. The examination consists of two parts. The first is open to the public and is scheduled as a seminar talk, usually for one of the regular meetings of a seminar series. The second is conducted in private and covers subjects closely related to the dissertation topic.

A student wishing to complete the Ph.D. requirements in four years should ordinarily complete the M.S. by the Spring Quarter of the first year, pass the qualifying examination by the Autumn Quarter of the second year and complete the course work, demonstrate feasibility of research methods, and obtain approval of the dissertation proposal by the end of the third year.

COMBINED PH.D./M.D. DEGREE PROGRAM

Students interested in a career oriented towards biomechanical research and clinical medicine can pursue the combined Ph.D./M.D. degree program.

The Ph.D. degree is administered by the Department of Mechanical Engineering of the School of Engineering. To be formally admitted as a Ph.D. degree candidate in this combined degree program, the student must apply through normal department channels and must have earned an M.S. in Mechanical Engineering, an M.S.E in Biomechanical Engineering, or a comparable master’s degree. Students must pass the Department of Mechanical Engineering Ph.D. qualifying examination and pursue a doctoral thesis in a biomechanical engineering area.

The M.D. degree is administered by the School of Medicine. Students must apply separately through regular channels for admission to the M.D. program and satisfactorily complete 204 units in courses and clerkships approved for credit toward the M.D. degree. Of these, 72 quarter units must be in clerkships. For further information on the M.D. program, consult the School of Medicine Catalog.

For students fulfilling the full M.D. requirements who earned their master’s level engineering degree at Stanford, the Department of Mechanical Engineering may waive its normal department requirement that the 36 units applied towards the Ph.D. degree (beyond the master’s degree level) be formal course work. Consistent with the University Ph.D. requirements, the department may instead accept 36 units consisting of courses, research, or seminars that are approved by the student’s Ph.D. thesis reading committee and the department chair. For further information, consult the manager of Student Services.

Ph.D. MINOR

Students who wish a Ph.D. minor in ME should consult the ME Student Services office. A minor in ME may be obtained by completing 20 units of approved graduate-level ME courses or by completing 9 units of graduate-level courses and passing the departmental qualifying oral examination in two appropriate areas identified by the minor adviser.

Courses approved for the minor must form a coherent program and must be selected from those satisfying requirement ‘2’ for the M.S. in Mechanical Engineering.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

(AU) indicates that the course is subject to the University Activity Unit limitations (8 units maximum).

PRIMARILY FOR UNDERGRADUATES

Note 1—The following are especially suitable for freshmen.

101. Visual Thinking

105. Manufacturing and Design

Note 2—Lab sections in experimental engineering are assigned in groups. If the lab schedule permits, students are allowed, with due regard to priority of application, to arrange own sections and lab periods. Enrollment with the instructor concerned, on the day before instruction begins or the first day of University instruction, is essential in order that the lab schedule may be prepared. Enrollment later than the first week is not permitted.

10. Introduction to Engineering Analysis—(Enroll in Engineering 10.)

30. Engineering Thermodynamics—(Enroll in Engineering 30.)

4 units, Win (Cappelli) Spr (Santiago)

38. The Design of Life—The design of a variety of living organisms is considered from a mechanical perspective.

3 units, Win (Carter)

70N. Stanford Introductory Seminar: The Aerodynamics of Sports Balls—Preference to freshmen. The aerodynamics of the ball play a major role in many sports, e.g., the curve and knuckle ball in baseball, the spiral of a correctly thrown football, the effect of top spin in tennis, and the effect of dimples on a golf ball. The complex aerodynamics can be understood by application of basic concepts and experimental techniques. Simple, intuitive application of the basic principles precede lab and/or field experiments to verify their intuition. Lab experiments involve flow visualization in a wind tunnel; field experiments may involve tests in throwing, hitting, or kicking various balls and interaction with local teams. Teams of two to three prepare a written report discussing the importance of aerodynamics in a particular sport.

3 units, Spr (Mungal)

71Q. Stanford Introductory Seminar: The Burning of Fossil Fuels, Global Warming, and the Environment—Preference to sophomores. Combustion has been humankind’s primary energy source. The role that combustion plays as a future energy source and the environmental and economic consequences of this. Issues: projections of energy utilization and energy sources into the future (and the associated uncertainties), the environmental effects of combustion (including air quality and global warming), strategies to reduce the environmental effects of combustion, and the role of regulations in driving combustion technology and the use of fossil fuels. Structured presentations, open discussion, directed readings. Outside speakers; visit to the campus combustion laboratory. Project with oral/written reports.

3 units (Bowman) not given 2000-01

72N. Stanford Introductory Seminar: The Jet Engine—Preference to freshmen. The basics of how a jet engine works and the technologies and
analytical techniques required to understand them. Brief coverage of
dynamics, thermodynamics, turbomachinery, combustion and pollution
formation, advanced materials, cooling technologies, and control sys-
tems. Field trips. Prerequisites: high school physics and an interest in
how mechanical things work.
3 units, Aut (Eaton)

73N. Stanford Introductory Seminar: Designing the Human Expe-
rience—An Exploration into the Theory and Practice of Design
Thinking—Preference to freshmen. Readings, discussion, and projects
explore the proposition that design education is for everyone.
3 units, Win (Leifer)

74N. Stanford Introductory Seminar: Stuff—Preference to freshmen.
The advancement of human society largely depends on the “stuff”
available for housing, transportation systems, industrial products, de-
defense systems, etc. Frequently, “human made stuff” gets exposed to
unfriendly environments such as high temperatures, corrosive liquids,
and gases. The most extreme conditions occurs in aircraft engines. A trip
to an airline maintenance facility provides insight to what environmental
conditions advanced turbine blades are required to suffer, and how
engineers prevent the premature “death” of turbine blades to avoid major
catastrophes.
3 units (Prinz) not given 2000-01

75N. Stanford Introductory Seminar: Mechanical Design Issues for
Sports Equipment—Preference to freshmen. Any sporting goods de-
partment reveals interesting examples of mechanical design, accompa-
nied by “literature” which highlights the novel design “features.” Design
features can be understood and are sensible, e.g., “perimeter weighting”
in golf clubs, or are less obvious, and perhaps of no real utility, e.g.,
“bubble shaft” in golf clubs or “fat head” in baseball bats. Analyses of
some designs, and conclusions about their relative merits.
3 units, Aut (Kenny)

76N. Stanford Introductory Seminar: Burn Baby Burn—The Sci-
ence of Flames—Preference to freshmen. The roles that chemistry and
fluid dynamics play in governing the behaviors of flames. Emphasis is on
factors that affect flame microstructure, external appearance, and on the
fundamental physical and chemical processes that cause flames and fires
to propagate. Topics: history, thermodynamics, and pollutant formation
in flames. Trips to labs where flames are studied. Prerequisites: high
school physics and an interest in thermochemical phenomena.
3 units, Spr (Mitchell)

99. Mechanical Dissection—Series of mechanical dissection labs to
resolve common questions of everyday products and provide confidence in
“hands-on” skills. Students choose a current product, track its history,
obtain samples (current and “antique”), disassemble, and explore func-
tions. Formal and informal presentations. Lab. Enrollment limited to 20.
Prerequisite: keen sense of curiosity.
3 units (Sheppard) not given 2000-01

100A.B. Mathematical and Computational Methods for Engineers—
(Enroll Engineering 155A.B.)

101. Visual Thinking—Lecture/lab. Visual thinking and language skills
are developed and exercised in the context of solving design problems.
Exercises for the mind's eye. Quickly executed diagrammatic, ortho-
graphic, perspective, and three-dimensional sketching with emphasis on
fluid and flexible idea production. The relation between visual
thinking and the creative process. Enrollment limited to 60.
3 units, Aut, Win, Spr (Staff)

102. Integration, Prototyping, Design, and Evaluation—The integra-
tion of human values, technology, and manufacturing towards engineering
solutions to design problems. Emphasis is on the development and
timely evaluation of potential candidates through the use of methodolo-
gy, computers, and rapid prototyping techniques. Lecture and lab.
Enrollment limited to 30.
3 units (Milroy) not given 2000-01

103. Manufacturing and Design—(Graduate students register for 303.)
Emphasis is on prototype development techniques as an intrinsic part of
the design process. The fundamentals of machining, welding, and
casting, introduced in lecture and supported by lab experience. Manufac-
turing processes through lecture, films, and field trips. Design aspects are
developed in an individual term project chosen, designed, and fabricated
by students. Limited enrollment with consent of instructor. Corequisite,
unless student has prior drafting experience: 103D. Corequisite for
Mechanical Engineering and Product Design undergraduate majors for
WIM: Engineering 102M. (WIM)
4 units, Aut, Win (Beach)

103D. Engineering Drawing and Design—The fundamentals of engi-
neering drawing including orthographic projection, dimensioning, sec-
tioning, exploded and auxiliary views, and assembly drawings. Designed
to accompany 103. Homework drawings are of parts fabricated by the
student in the shop. Major assignments in 103 are supported by material
in 103D and assignment dates are sequenced on the assumption that the
student is enrolled in both courses simultaneously.
1 unit, Aut, Win (Milroy)

104. Dynamic Behavior—(Enroll in Engineering 104.)

105. Feedback Control Design—(Enroll in Engineering 105.)

106. Vehicle Dynamics and Control—(Graduate students register for
227.) The application of the principles of dynamics, kinematics, and
control theory to the design and analysis of ground vehicle behavior.
Simplified models of ride, handling, and braking, their role in developing
intuition, and their limitations in engineering design. Suspension design
fundamentals. Multibody dynamics approaches to vehicle modeling.
Performance and safety enhancement through automatic control systems
such as anti-lock braking, active suspensions, and stability control.
Prerequisite: 161 or Engineering 104.
3 units, Spr (Gerdes)

106D. Vehicle Dynamics and Control Laboratory—(Graduate stu-
dents register for 227D.) Demonstration of handling fundamentals,
suspension set-up, and controller design using scale cars.
1 unit, Spr (Gerdes)

109. Computer Aided Design of Model Yachts—(Graduate stu-
dents register for 209.) Hands-on introduction to the art and science of
engineering and manufacturing. Students design and construct free
sailing model yachts to a high standard of craftsmanship using Computer
Aided Design and Manufacturing (CAD/CAM). Includes: sailing theory
(aerodynamics and hydrodynamics of sail boats); model yacht design
(nomenclature, scaling issues, lofting, history of rating rules, yacht
aesthetics, tradeoffs between speed and control); the use of design and
manufacturing systems (MaxSurf, Vellum, and laser-cuter); necessary
construction techniques (hull fixture, planking, fiberglassing, casting
ballast, sail making, finishing, and rigging); and sailing technique
(tuning for performance). Field trips. Enrollment limited to 33.
4 units (Fastie) alternate years, given 2001-02

110A. Design Sketching—Freehand sketching, rendering, and design
development. Work is guided by instructors. Concurrent assignments in
115 and 116B.C provide subject matter, but the class is open to anyone
wishing to improve freehand drawing skills. (AU)
1 unit, Win, Spr (Staff)

110B. Advanced Design Sketching—Freehand sketching, rendering,
design development, and some computer use. Work is guided by instruc-
111. Stress, Strain, and Strength—Review of the basic mechanics of materials and engineering properties of structural materials. Stress concentrations and their avoidance through design. Static failure theories for ductile and brittle materials. Introduction to friction mechanics. Review of surface failure mechanisms including corrosion, fretting, and wear. Structural failure by global and local buckling of columns and plates. Introduction to failure by fatigue; fatigue failure criteria and life prediction methods. Case studies in failure of structural components emphasizing applications to mechanical design.

3 units, Aut (Pinsky)

112. Mechanical Systems Design—Objectives: provide students familiarity with the function of basic machine elements (e.g., gears, bearings), the trade-offs between various classes of machine elements, performance characteristics of various machine elements, and systems level design; and to provide experience in working in teams, selecting machine classes in synthesis-type problems, iterative design including prototyping, communicating ideas in graphical, textual, and oral forms, and design critiquing. Lecturers, labs. Prerequisites: 101, 111. Recommended: 103, Engineering 15.

4 units, Win (Gerdes)

113. Mechanical Engineering Design—Objective: create designs and models of new mechanical devices. Design is studied as an activity and experienced by students as they work on a team design project obtained from industry and other sponsoring organizations. Prerequisites: 101, 103, 111, 112.

3 units, Spr (Staff)

114. Elements of Form—An exploration of proportion, rhythm, metaphor, scale, modularity, and other key concepts that enhance the designer's ability to generate appropriate form. Demonstrations, discussions, drawing, product examples, and modeling exercises develop the student's form vocabulary. Enrollment limited to 12. Prerequisites: 103, 115, and consent of instructor.

2 units, Spr (Fast)

115. Human Values in Design—Active encounters with human values in design. Lectures survey the central philosophy of the product design program, emphasizing the relation between technical and human values, the innovation process, and design methodology. Lab exercises include development of simple product concepts visualized in rapidly executed three-dimensional mockups. Prerequisite: 101.

3 units, Win (Kelley)

116A. Advanced Product Design: Formgiving—(Graduate students register for 316A.) Small- and medium-scale design projects are carried to a high degree of aesthetic refinement. Emphasis is on generating the appropriate forms to the task and setting. Prerequisites: 115, Art and Art History 160.

4 units, Aut (Staff)

116B. Advanced Product Design: Needfinding—(Graduate students register for 316B.) Exploration of human needs that leads to conceptualization of future products, environments, systems, and services. Field work in public and private settings; appraisal of personal values; readings on social ethnographic issues; and needfinding for a corporate client. Emphasis is on developing the flexible thinking skills that enable the designer to navigate the future. Prerequisite: 115, 116A, or consent of instructor.

4 units, Win (Faste)

116C. Advanced Product Design: Implementation—(Graduate students register for 316C.) Summary project utilizing the knowledge, methodology, and skills obtained in 115A,B, and 116A,B. Students implement design concept and present it to a professional jury. Prerequisite: 116.

4 units, Spr (Staff)

117. Introduction to Sensors—(Graduate students register for 220.) Sensors are widely used in scientific research and as an integral part of commercial products and automated systems. The basic principles for sensing displacement, force, pressure, acceleration, temperature, optical radiation, nuclear radiation, and other physical parameters. Performance, cost, and operating requirements of available sensors.Elementary electronic circuits which are typically used with sensors. Lecture demonstration of a representative sensor from each category elucidates operating principles and typical performance. Lab experiments with off-the-shelf devices.

3-4 units, Spr (Kenny)

118. Introduction to Mechatronics—(Graduate students register for 318.) Open to undergraduate and graduate students. Introduces the technologies involved in mechatronics (Intelligent Electro-Mechanical Systems) and the techniques necessary to apply this technology to mechatronic system design. Topics: electronics (A/D, D/A converters, op-amps, filters, power devices); software program design, event-driven programming; hardware and DC stepper motors, solenoids, and robust sensing. Lab component of structural assignments. Large and open-ended team project. Limited enrollment. Prerequisites: Engineering 40, Computer Science 106, or equivalent.

4 units, Win (Kenny, Ohline)

120. History and Philosophy of Design—Major schools of 19th- and 20th-century design (Arts-and-Crafts Movement, Bauhaus, Industrial Design, and post-modernism) are analyzed in terms of their continuing cultural relevance. The relation of design to art, technology, and politics; readings from principal theorists, practitioners, and critics; recent controversies in industrial and graphic design, architecture, and urbanism. Enrollment limited to 40.

4 units, Spr (Katz)

128. Design for Appropriate Technology—(Graduate students register for 328.) Lecture/lab. Design products for developing countries and markets with emphasis on culturally sensitive need determination; local material, process, and maintenance limitation; and information transfer. Weekly labs reinforce lecture topics. Team design projects explore solutions to real-world needs.

3 units, Spr (Staff)

128X. Design for Appropriate Technology Seminar—(Graduate students register for 328X.) Lecture. Design products for developing countries and markets with emphasis on culturally sensitive need determination; local material, process, and maintenance limitation; and information transfer.

1 unit, Spr (Staff)

130. Internal Combustion Engines—Internal combustion engines including conventional and turbocharged spark ignition, and diesel engines. Lectures: basic engine cycles, engine components, methods of analysis of engine performance, pollutant emissions, and methods of engine testing. Lab involves hands-on experience with engines and test hardware. Limited enrollment. Prerequisites: Engineering 30, 33, 131A (or concurrent enrollment in 131A), or equivalent.

3 units, Aut (Edwards)

131A. Heat Transfer—(Graduate students register for 250.) The principles of heat transfer by conduction, convection, and radiation are introduced with specific examples from the engineering of practical devices and systems. Topics: transient and steady conduction, conduction by extended surfaces, boundary layer theory for forced and natural convection, boiling, heat exchangers, and graybody radiative exchange.
Prerequisites: 33, Engineering 30. Recommended: intermediate calculus, ordinary differential equations.
4 units, Aut (Goodson)

131B. Fluid Mechanics: Compressible Flow and Turbomachinery—Introduction to engineering applications involving compressible flow: aircraft propulsion, rocket propulsion, power generation; application of mass, momentum, energy and entropy balance to compressible flows; variable area isentropic flow, normal shock waves, adiabatic flow with friction, flow with heat addition, Operation of flow systems: the propulsion system. Introduction to turbomachinery: pumps, compressors, turbines. Angular momentum analysis of turbomachine performance, centrifugal and axial flow machines, effect of blade geometry, dimensionless performance of turbomachines; hydraulic turbines; steam turbines; wind turbines. Compressible flow turbomachinery: the aircraft engine. Prerequisite: 131A.
3 units, Win (Squires)

134. Modern Experimentation—Practical introduction to modern techniques for data acquisition, experimental control, and statistical and time-domain analysis of sampled data. Introduction to and use of a range of measurement devices including traditional sensors and optically-based systems. Lab includes individual work in computerized data acquisition and experimental control including A/D and D/A conversion, digital interfacing, and software development using powerful graphical programming. Statistical concepts and sensor systems are introduced with simple experiments on small devices. Teams develop a fully integrated experiment to test and improve an interesting engineering system. Prerequisites: 33, 131A.
3 units, Win (Eaton)

140. Integrated Thermal Systems—Capstone course in thermal science, providing experience in thermal analysis and engineering, with emphasis on integrating heat transfer, fluid mechanics, and thermodynamics into a unified approach to treating complex systems. Lecture introduces mixtures, humidity, chemical and phase equilibrium, and availability. Labs apply principles through hands-on experience with a turbojet engine, a PEM fuel cell, and a hybrid solid/oxygen rocket motor. Analysis of systems is facilitated using MATLAB as a computational tool. Prerequisites: 131A, 131B, Engineering 30.
4 units, Spr (Edwards)

161. Dynamic Systems—Modeling, analysis, and measurement of mechanical and electromechanical systems. Numerical and closed form solutions of ordinary differential equations governing the behavior of single and multiple degree of freedom systems. Stability, resonance, amplification and attenuation, and control system design. Demonstrations and laboratory examples. Prerequisites: background in dynamics and calculus, e.g., Engineering 15 and Mathematics 43; and familiarity with differential equations, linear algebra, and basic electronics.
4 units, Aut (Mitiguy)

180. Skeletal Development and Evolution—(Graduate students register for 280.) The development, adaptation, repair, and aging of the vertebrate skeleton is considered from an evolutionary perspective. Emphasis is on the interacting influences of mechanobiology and molecular genetics.
3 units, Spr (Carter)

181. Biomechanics of Movement—(Graduate students register for 381.) Review of experimental techniques used to study human and animal movement, including motion capture systems, EMG, force plates, medical imaging, and animation. The mechanical properties of muscle and tendon, and quantitative analysis of musculoskeletal geometry. Projects and demonstrations emphasize applications of mechanics in sports, orthopaedics, neurology, and rehabilitation.
3 units, Aut (Delp)

182. Biomineralization—The process of formation and adaptation of mineralized structures formed by organisms, principally animal skeletons. Emphasis is on the interacting influences of phylogenetic history, material constraints, mechanical factors, and other ecological and physiological considerations. Skeletal formation processes and the skeletal microstructure and ultrastructure of every animal phylum. The evolutionary aspects of body plan design among the major animal phyla with skeletons.
2 units, Spr (Constants)

184A. Cardiovascular Biomechanics—(Graduate students register for 284A.) Biomechanical principles are developed and applied to the cardiovascular system. The relevance of mechanics in the study of cardiovascular function is examined from a historical perspective. Cardiovascular system anatomy, tissue mechanics, and blood rheology. Lumped parameter models, wave propagation models. Womersley theory, finite element methods of blood flow, pulsatile flow in deformable vessels, and cardiac fluid dynamics. Problems in modeling blood flow within the context of disease research, device design, and surgical planning.
3 units, Win (Taylor)

184B. Cardiovascular Biomechanics—Continuation of 184A.
3 units, Spr (Taylor)

191. Engineering Problems and Experimental Investigation—Directed study and research for undergraduates on a subject of mutual interest to student and staff member. Student must find faculty sponsor and have approval of the adviser.
1-5 units, any quarter (Staff)

194. Medical Device Design—(Graduate students register for 384.) Offered in collaboration with the School of Medicine. Introduction to medical device design for undergraduate and graduate engineering students. Significant design and prototyping. Labs expose students to medical device environments, including hands on device testing and field trips to operating rooms and local device companies. Limited enrollment. Prerequisite: 103/303.
3 units, Aut (Milroy)

1-3 units, Spr (Milroy)

UNDERGRADUATE AND GRADUATE

The following are especially suitable for advanced undergraduates and graduates and may be used to satisfy the M.S. requirement, item '3' above, approved electives.
103. Manufacturing and Design
105. Feedback Control Design—Enroll in Engineering 105
113. Engineering Design
161. Dynamic Systems
250. Heat Transfer

PRIMARILY FOR GRADUATES

ENGINEERING MATHEMATICS AND COMPUTATION

200A, B, C are intended for students in the master’s program with some proficiency in undergraduate engineering mathematics and computing. Students enrolling in this sequence should have had some exposure to elementary linear algebra (for example, elementary operations with matrices), ordinary differential equations (for example, Mathematics 130), and computer programming. Students who do not meet these guidelines should be prepared to devote additional remedial time to these courses or consider satisfying their requirements through Mathematics 113 and 131, and Computer Science 137.

200A. Mathematical and Computational Methods in Engineering—The theory of linear algebra; basis, linear independence, column space,
null space, rank. Emphasis is on computer solutions of the linear system of algebraic and differential equations. Roundoff errors, pivoting, and ill-conditioned matrices. Quadratic forms, norm and condition numbers, projection and least-squares, operation counts, eigenvalues, eigenvectors, and their computation. The canonical diagonal form, functions of a matrix. Unitary, Hermitian, and normal matrices. Principal stresses and axes. Recommended: familiarity with computer programming; Mathematics 103, 130, or equivalent.

3 units, Aut (Staff)

200B. Mathematical and Computational Methods in Engineering—Geometric interpretation of partial differential equations (PDEs), characteristics, solution of first-order equations, characteristics and classification of second-order PDEs, separation of variables, special functions, eigenfunction expansions, Fourier integrals and transforms, Laplace transforms, method of characteristics, analytic and numerical techniques, self-similarity. Prerequisite: 200A.
3 units, Win (Fierziger)

3 units, Spr (Moin)

206. Introduction to Symmetry Analysis—(Enroll in Aeronautics and Astronautics 218.)

DESIGN AND CONTROLS

207A,B. Integrated Design for Marketability and Manufacturing (IDMM)—Integrated market research, product design, prototype manufacture, pricing, and product management. New product launching, with emphasis on compressed development cycle time and cross functional staffing. Teams of MBAs and engineers compete for simulated sales and profitability. Innovative use of market research as a design tool, immersion in hands-on manufacturing process, product definition communication, and sales. Emphasis on process and material selection, design for productability, failure modes and effects analysis (FMEA), design for serviceability, environmental product design, and organization issues for simultaneous engineering. Enrollment limited to 40. No maximum enrollment for Stanford Instructional Television Network (SITN) students. Minimum enrollment of two per viewing site; single student site by prior consent of instructor. Prerequisite: 217A.
4 units, Aut, Win (Beach, Srinivasan)

211A,B,C. Product Design Master’s Thesis—For Product Design or Design (Art) majors only. Students create and present two masters’ theses under the supervision of engineering and art faculty. Theses involve the synthesis of aesthetics and technological concerns in the service of human need and possibility. Product Design students take for 4 units, Art students take for 2 units. Corequisite: Art and Art History 360.

211A. 2-4 units, Aut (Faste, Kelley)
211B. 2-4 units, Win (Faste, Kelley)
211C. 2-4 units, Spr (Faste, Kelley)

212. Calibrating the Instrument—Open to Product Design or Design (Art) majors. Calibrating the designer’s mind/body “instrument” in regards to aesthetic, kinesthetic, sensory, behavioral and experiential self-knowledge. Improvisation, educational kinesiology, Brain Gym, Zazen, and other methods are used to center and inform the designer. Shared stories and goal setting begin building community.
2 units, Aut (L. Faste, R. Faste)

3 units, Spr (Milroy)

214. Good Products and Bad Products—An analysis of characteristics of industrial products that can cause them to be successes or failures: the straight-forward (performance, economy, reliability), the complicated (human and cultural fit, compatibility with the environment, craftsmanship, positive emotional response of the user), the esoteric (elegance, sophistication, symbolism). Engineers and business people must better understand these factors to produce more successful products. Readings, lectures, projects, papers, guest speakers, and field trips. Enrollment limited.
3 units, Win (Adams, Beach)

215. The Designer in Society—Open to all graduate students. Participants’ career objectives and psychological orientation are compared with existing social values and conditions. Emphasis is on assisting individuals in assessing their roles in society. Readings on political, social, and humanistic thought are related to technology and design. Experiential, in-class exercises, and term project. Attendance mandatory. Enrollment limited to 24.
3 units, Win (Roth)

216. Introduction to Aircraft Design, Synthesis, and Analysis—(Enroll in Aeronautics and Astronautics 241A.)

217A. Design for Manufacturability: Product Definition—Systematic methodologies to define, develop, and produce competitive products. Methods cover the characterization of user values, design for manufacturability, and environmental compatibility. 217A addresses the key issues for product competitiveness. Student teams identify opportunities for improvement and develop a comprehensive product definition. Topics: design for value, functional analysis, quality function deployment, value engineering, design for assembly, product line structuring, process and material selection, design for productability, failure modes and effects analysis (FMEA), design for serviceability, environmental product design, and organization issues for simultaneous engineering. Enrollment limited to 40. No maximum enrollment for Stanford Instructional Television Network (SITN) students. Minimum enrollment of two per viewing site; single student site by prior consent of instructor.
4 units, Win (Ishii)

217B. Design for Manufacturability: Quality by Design—Building on the product definition process covered in 217A, focuses on the implementation of competitive product design. Student groups apply structured methods to optimize the design of an improved product, and plan for its manufacture, testing, and service. The project deliverable is a comprehensive product and process specification. Topics: concept generation and selection (Pugh’s Method), FMEA applied to manufacturing process, design for robustness, Taguchi Method, SPC and six sigma process, tolerance analysis, flexible manufacturing, product testing, rapid prototyping. Enrollment limited to 40, not including SITN students. Minimum enrollment of two per SITN viewing site; single student site by prior consent of instructor. Prerequisite: 217A.
4 units, Spr (Ishii)

217C. Manufacturing Systems Design—(Enroll in Management Science and Engineering 264.)
218A. Smart Product Design Fundamentals—Introduction. Lecture, lab, and design project based series on programmable electromechanical systems design. Topics: transistors as switches, basic digital and analog circuits, boolean algebra, combinatorial and sequential logic, operational amplifiers, comparators, software design, programming in FORTH and "C." Team project. Enrollment in 218B,C is contingent on completing 218A or passing a Smart Product Design Fundamentals proficiency examination given at the start of Autumn Quarter. Lab fee. Limited enrollment.

5 units, Aut (Carreyer)

218B. Smart Product Design Applications—Intermediate level in the series of programmable electromechanical systems design, introduced in the context of lab assignments and integrated into a team project. Topics: user I/O, timer systems, interrupts, signal conditioning, software design for embedded systems, sensors, actuators, noise, and power supplies. Team project. Lab fee. Limited enrollment. Prerequisite: completion of 218A or passing of the Smart Product Design Fundamentals proficiency examination.

5 units, Win (Carreyer)

218C. Smart Product Design Practice—Advanced level in the series of programmable electromechanical systems design. Topics: microprocessor communication, system design with multiple microprocessors, architecture and assembly language programming for the PIC microcontroller, design with programmable logic, understanding and controlling the embedded software tool chain, A/D and D/A techniques, electronic manufacturing technology. Lab fee. Limited enrollment. Team project. Prerequisite: completion of 218B.

5 units, Spr (Carreyer)

218D. Smart Product Design Projects—Industrially sponsored project course is the culmination of the Smart Product Design sequence. Student teams take on an industrial project that requires the application and extension of the knowledge gained in the prior three quarters, including prototyping of a final solution with hardware, software, and professional documentation and presentation. Lectures extend the students' knowledge of electronic and software design, and electronic manufacturing techniques. Topics: chip level design of microprocessor systems, real time operating systems, alternate microprocessor architectures, PCB layout and fabrication.

4 units, Aut (Carreyer)

219. Introduction to Robotics—(Enroll in Computer Science 223A.)

220. Introduction to Sensors—See 117.

221. Materials Selection in Design—(Enroll in Materials Science and Engineering 270.)

222. Kinematic Synthesis of Mechanisms—The rational design of linkages. Techniques are presented to determine linkage proportions to fulfill various design requirements using analytical, graphical, and computer based methods.

3 units, Win (Roth)

224. Precision Engineering—Advances in engineering are often enabled by more accurate control of manufacturing and measuring tolerances. Concepts and technology enable precision such that the ratio of overall dimensions to uncertainty of measurement is large relative to normal engineering practice. Typical application areas: non-spherical optics, computer information storage devices, and manufacturing metrology systems. Application experience is gained through the design and manufacture of a precision engineering project, emphasizing the principles of precision engineering. Lectures, structured labs, and field trips. Undergraduate prerequisite: consent of instructors.

4 units, Spr (Beach, DeBra)

225A. Control System Design and Simulation—(Enroll in Engineering 206.)

225B. Analysis and Control of Nonlinear Systems—(Enroll in Engineering 209A.)

226A. Modern Control Design I—(Enroll in Engineering 207A.)

226B. Modern Control Design II—(Enroll in Engineering 207B.)

227. Vehicle Dynamics and Control—See 106.

227D. Vehicle Dynamics and Control Laboratory—See 106D.

228. Introduction to Control Design Techniques—(Enroll in Engineering 205.)

MECHANICS OF SOLIDS

3 units, Spr (Cho)

230. Advanced Kinematics—Kinematics from mathematical viewpoints. Introduction to algebraic geometry of point, line, and plane elements. Emphasis is on basic theories which have potential application to mechanical linkages, computational geometry, and robotics.

3 units, Aui (Roth)

3 units, Aui (Heegaard)

3 units, Win (Heegaard)

232A. Introduction to Computational Mechanics I—Overview of modern computational methods for solving problems arising in the mechanics of solids and structures. Basic concepts of the finite element method (FEM) and boundary element method (BEM). Equations of linear solid mechanics including variational formulations. Elastic bars (elasticity in one-dimension), steady heat conduction (diffusion), and plane elasticity (plane stress and strain, axisymmetric elasticity). Students develop a finite element code in Matlab using the PDE Toolbox pre- and post-processor, solve problems, and visualize results at every stage. Introduction to simulation-based design methodologies.

3 units, Win (Pinsky)

232B. Introduction to Computational Mechanics II—Introduction to convergence analysis of the finite and boundary element method. Advanced element formulations: mixed finite element models for incompressible and constrained media. Variational treatment of constraints based on Lagrange multiplier and penalty methods; contact mechanics. Extension of the finite element and boundary element methods to time-dependent problems, including transient heat conduction and dynamic
analysis. Extension of Matlab finite element code for the time-dependent problems.
3 units, Spr (Pinsky)

3 units (Hughes) alternate years, not given 2001-02

234B. Finite Element Methods in Fluid Mechanics—Continuation of 234A.
3 units (Hughes) alternate years, not given 2001-02

234C. Finite Element Methods in Fluid Mechanics—Continuation of 234B.
3 units (Hughes) alternate years, not given 2001-02

3 units (Hughes) alternate years, given 2001-02

3 units (Hughes) alternate years, given 2001-02

3 units (Hughes) alternate years, given 2001-02

237. Free and Forc ed Motion of Structures—(Enroll in Aeronautics and Astronautics 244A.)

3 units, Aut (Cho)

3 units, Win (Cho)

3 units, Win (Gao)

3 units, Spr (Gao)

3 units (Gao)

241A. Theory of Plates—Analysis of stress, deformation in plates bent by transverse loads. Applications to circular, rectangular, other shapes. Vibrations, buckling. Prerequisite: 111 or Civil and Environmental Engineering 114.
3 units (Steele)

241B. Theory of Shells—Axisymmetric deformation of shells of revolution. Asymptotic expansions, direct and bending stress. Application to design of domes, pressure vessels, expansion joints and pressure sensing devices. Use of asymptotic solutions for "very large finite element computation." Prerequisite: 111 or Civil and Environmental Engineering 114.
3 units (Steele)

3 units, Spr (Steele)

243. Micromechanics—(Enroll in Materials Science and Engineering 350.)

244. Atomistic Simulations of Materials—Fundamental concepts and practical techniques of atomistic simulations. Fundamental concepts of molecular dynamics (MD) and Monte Carlo (MC) simulations are introduced based on the finite difference method. Practical computational techniques of MD and MC simulations. The strength and weakness of atomistic simulations under the light of the accuracy of interatomic potentials. Standard methods of simulation analysis in connection with numerical data analysis and statistical mechanics. Advanced simulation techniques (generalized MD, smart MC simulations, accelerated dynamics, and multiscale analysis).
3 units (Cho) not given 2000-01

3 units, Win (Nelson)

246. Techniques of Failure Analysis—Enroll in Aeronautics and Astronautics 252.

247A. Microstructure and Mechanical Properties—(Enroll in Materials Science and Engineering 251.)

248. Experimental Stress Analysis—Theory and applications of photoelasticity, strain gages, and holographic interferometry. Comparison of test results with theoretical predictions of stress and strain. Discussion of other methods of stress and strain determination (optical fiber sensors, acoustoelasticity, thermoelasticity, brittle coating, Moiré). Student project on use of strain gages. Lab fee.

3 units, Spr (Nelson)

249A. Quantum Simulations of Molecules and Materials—(Enroll in Chemical Engineering 444A.)

3 units (Cho) not given 2000-01

HEAT TRANSFER, FLUID MECHANICS, AND HIGH TEMPERATURE GAS DYNAMICS

250. Heat Transfer—For graduate students; see 131A.

3 units, Aut

251A. Fluid Mechanics—Exact and approximate analysis of fluid flow covering kinematics, global and differential equations of mass, momentum, and energy conversation. Forces and stresses in fluids. Euler’s equations and the Bernoulli theorem applied to inviscid flows. Vorticity dynamics. Topics in irrotational flow: stream function and velocity potential for exact and approximate solutions; superposition of solutions; complex potential function; circulation and lift. Some boundary layer concepts.

3 units, Aut (Lele)

251B. Fluid Mechanics—Laminar viscous fluid flow. Brief review of governing equations, boundary conditions, and constitutive laws. Exact solutions for parallel flows. Creeping flow limit, lubrication theory, and boundary layer theory including free-shear layers and approximate methods of solution; boundary layer separation. Introduction to stability theory and transition to turbulence. Prerequisite: 251A.

3 units, Win (Lele)

252A. Radiative Heat Transfer—The fundamentals of thermal radiation heat transfer; blackbody radiation laws; radiative properties of non-black surfaces; analysis of radiative exchange between surfaces and in enclosures; combined radiation, conduction, and convection; radiative transfer in absorbing, emitting, and scattering media. Advanced material for students with interests in heat transfer, as applied in high-temperature energy conversion systems. Take 252B,C for depth in heat transfer. Prerequisites: graduate standing and undergraduate course in heat transfer. Recommended: computer skills.

3 units, Aut (Mitchell)

3 units, Win (Goodson)

3 units, Spr (Eaton)

254. Computers and Instrumentation in the Fluid Mechanics Laboratory—Experimental methods associated with the interfacing of laboratory instruments, experimental control, sampling strategies, data analysis, and introductory image processing. Instrumentation including point-wise anemometers and particle image tracking systems. Lab. Prerequisites: previous experience with computer programming and consent of instructor.

3 or 4 units, Win (Santiago)

255. Compressible Flow—Recommended for students with little experience in compressible flow. Introduction to compressible flow. Sound waves and normal shock-waves. Quasi-one-dimensional steady flows in variable area ducts with friction, heating, and cooling; unsteady one-dimensional flow, two-dimensional supersonic flow; oblique shock waves, Prandtl-Meyer expansions, detonation waves, method of characteristics.

3 units, Win (Bowman)

256. Turbomachinery, Fluid Dynamics, and Design—Theory, performance, and design of turbomachines (turbines, pumps, compressors, wind turbines, etc.). Turbomachines function as the result of the dynamic interaction of a moving fluid with a bladed rotor. Problems sets, and a final design problem such as the specification of blading for a compressor or a turbine stage to meet prescribed performance criteria. Prerequisites: 251A or equivalent, plus one-dimensional flow of a perfect gas as presented in 131B or equivalent.

3 units, Staff not given 2000-01

257. Fluid Flow in Microdevices—Introduction to the effects of physico-chemical forces on the fluid flow of micron-scale flow devices. Basic descriptions of creeping flow, charge double-layers, and electrochemical transport (e.g., Nernst-Planck equations) lead to a study of the hydrodynamics of solutions of charged and uncharged particles. Device applications of interest include microsystems that perform capillary electrophoresis, drug dispersion, and hybridization assays. Emphasis is on bioanalytical applications where electrophoresis, electro-osmosis, and Brownian motion effects are important. Prerequisite: consent of instructor.

3 units, Aut (Santiago)

258. Heat Transfer in Microdevices—Application-driven introduction to the thermal design of electronic circuits, sensors, and actuators that
have dimensions comparable to or smaller than one micrometer. The impact of thin-layer boundaries on thermal conduction and radiation. Convection in microchannels and microscopic heat pipes. Thermal property measurements for microdevices. Emphasis is on Si and GaAs semiconductor devices and layers of unusual, technically-promising materials, e.g., chemical-vapor-deposited (CVD) diamond. Final project can be based on student research interests. Prerequisite: consent of instructor.

3 units, Spr (Goodson)

259A. Numerical Methods in Fluid Mechanics—(Enroll in Aeronautics and Astronautics 214A.)

259B. Numerical Computation of Compressible Flow—(Enroll in Aeronautics and Astronautics 214B.)

259C. Numerical Computation of Viscous Flow—(Enroll in Aeronautics and Astronautics 214C.)

261A. Statistical Theory and Modeling for Turbulent Flow—Averaging and correlations, vorticity and vortex stretching, and the energy cascade. Reynolds stresses; introduction to transport equations. Length scales and spectra; "universal" scaling of small eddies. Law of the wall, local equilibrium, and eddy viscosity. Properties of boundary layers and other "thin" shear layers; complex flows. Introduction to prediction methods; local equilibrium, stress-transport, and eddy-viscosity transport models. Prerequisite: 251B.

3 units, Win (Staff)

261B. Advanced Topics in Turbulence—Topics vary each year and may include: spectral representation, rapid distortion theory, Cayley-Hamilton theorem and constitutive modeling of turbulence, turbulent dispersion, stochastic differential equations, Reynolds average and modeling for reacting flows, vortical structures (topology), intermittancy, proper orthogonal characteristic eddy decomposition, chaos, Lyapunov exponents, fractals, large eddy simulations, subgrid closure, and geophysical turbulence.

3 units, Spr (Staff)

262A. Physical Gas Dynamics—Concepts and techniques for description of high-temperature and chemically reacting gases from a molecular point of view. Introductory kinetic theory, chemical thermodynamics, and statistical mechanics as applied to properties of gases and gas mixtures. Transport and thermodynamic properties, law of mass action, and equilibrium chemical composition. Maxwellian and Boltzmann distributions of velocity and molecular energy. Examples and applications from areas of current interest, e.g., combustion and materials processing.

3 units, Aut (Cappelli)

262B. Nonequilibrium Processes in High-Temperature Gases—Introduction to chemical kinetics and energy transfer in high-temperature gases. Collision theory, transition state theory, and unimolecular reaction theory. Prerequisite: 262A.

3 units, Win (Golden)

263. Partially Ionized Plasmas and Gas Discharges—Introduction to partially ionized gases and the nature of gas discharges. Topics: the fundamentals of plasma physics emphasizing collisional and radiative processes, electron and ion transport, ohmic dissipation, oscillations and waves, interaction of electromagnetic waves with plasmas. Applications: plasma diagnostics, plasma propulsion and materials processing. Prerequisite: 262A or consent of instructor.

3 units, Spr (Cappelli)

264. Optical Diagnostics and Spectroscopy—Introduction to the spectroscopy of gases and laser-based diagnostic techniques for measurements of species concentrations, temperature, density, and other flow field properties. Topics: electronic, vibrational, and rotational transitions; spectral lineshapes and broadening mechanisms; absorption, fluorescence, Rayleigh and Raman scattering methods; collisional quenching. Prerequisite: 262A or equivalent.

3 units (Hanson) not given 2000-01

4 units, Spr (Hanson)

269A. Computational Methods in Fluid Mechanics—Advanced methods for solving systems of linear equations; multigrid and conjugate gradient methods; methods for potential flow; integral methods for boundary layers and their coupling to potential flow solutions; methods for the boundary layer equations; methods for solving the incompressible flow equations on structured grids: projection, fractional step and artificial compressibility methods. Students use and modify provided codes. Prerequisites: 200C, 251B or equivalents.

3 units, Aut (Ferziger)

269B. Computational Methods in Fluid Mechanics—Review of turbulence modeling; solution of the incompressible flow equations with turbulence models; methods for convective heat and mass transfer; methods for reacting flows, finite volume methods for structured and unstructured grids; direct numerical; simulation; large eddy simulation including subgrid scale models and numerical methods; methods for two phase flows; applications to compressible flow. Project involving solution of a problem of the student’s choosing. Prerequisite: 269A.

3 units, Win (Staff)

THERMODYNAMICS AND ENERGY CONVERSION

270. Engineering Thermodynamics—Thermodynamic analysis of engineering systems, emphasizing systematic methodology for application of basic principles. Introduction to availability analysis. Thermodynamics of gas mixtures and reacting systems. Modern computational equations of state. Thermodynamics of condensed phases, including solutions. Prerequisites: undergraduate background in engineering thermodynamics and computer skills.

3 units, Aut (Bowman)

271. Combustion Fundamentals—Heat of reaction, adiabatic flame temperature, and chemical composition of products of combustion; kinetics of combustion and pollutant formation reactions; conservation equations for multi-component reacting flows; propagation of laminar premixed flames and detonations. Prerequisite: 262A or 270, or consent of instructor.

3 units, Win (Mitchell)

272. Combustion Applications—The role of chemical and physical processes in combustion; ignition, flammability, and quenching of combustible gas mixtures; premixed turbulent flames; laminar and turbulent diffusion flames; combustion of fuel droplets and sprays. Prerequisite: 271.

3 units, Spr (Bowman)

BIOMECHANICAL ENGINEERING

281. Orthopaedic/Cardiovascular Bioengineering and Medicine—Engineering approaches are applied to the musculoskeletal and cardiovascular system within the context of surgical and medical care. Introduction to fundamental anatomy and physiology. The material and structural characteristics of hard and soft connective tissues and organ systems, and the role of mechanics in normal development and pathogen-
282A. Biomedical Device Design and Evaluation I—Introduction to the problems and challenges of biomedical device design and evaluation. Students engage in industry sponsored projects resulting in new designs, physical prototypes, design analyses, computational models, and experimental tests, gaining experience in: the formation of design teams; interdisciplinary communication skills; regulatory issues; biological, anatomical, and physiological considerations; testing standards for medical devices; and intellectual property. Attendance at grand rounds in clinical departments.

4 units, Win (Delp, Andriacchi)

282B. Biomedical Device Design and Evaluation II—Continued industry sponsored projects from 282A. With the assistance of faculty and expert consultants, students finalize product designs or complete detailed design evaluations of new medical products. Attendance at grand rounds in clinical departments. Strategies for funding new medical ventures.

4 units, Spr (Andriacchi)

283. Computational Locomotion Biomechanics—Review of the computational methods used to model and simulate the mechanics of human locomotion. Multibody dynamics, inverse dynamics, simple models of locomotion, torque actuation and energy flow. Joint kinematics and biomechanics, models of articular contact. Optimal control of musculo-tendon units, simulation of locomotion tasks including human gait and athletic performance. Prerequisite: 231, 381, or equivalent.

3 units (Heegaard, Delp) alternate years, given 2001-02

284A. Cardiovascular Biomechanics—See 184A.

284B. Cardiovascular Biomechanics—See 184B.

285. Tissue Engineering—Tissue engineering is an expanding discipline that applies biological and engineering principles to create substitutes or replacements for defective tissues or organs. The principles of cell biology provide a foundation for using engineering approaches to generate tissue structure and function. Emphasis is on how scaffolds, smart polymers, and mechanical forces can be used to reproduce the physical environment that acts, at the whole organ system level, to maintain specialized cellular function through molecular and genetic mechanisms.

2 units, Win (Smith)

286. Neuromuscular Biomechanics—The interplay between mechanics and neural control of movement. State of the art assessment through a review of classic and recent journal articles. Emphasis is on the application of dynamics and control to the design of assistive technology for persons with movement disorders.

3 units, Spr (Delp)

287. Biomechanics and Ecological Physiology of Intertidal Communities—(Enroll in Biological Sciences 277H.)

290. Thermosciences Research Project Seminar—Review of work in a particular research program and presentations of other related work. (AU)

1 unit, Aut, Win, Spr (Staff)

291. Engineering Problems—Directed study for graduate engineering students on subjects of mutual interest to student and staff member. May be used to prepare for experimental research during a later quarter under 292. Students must find a faculty sponsor.

1-5 units, any quarter (Staff)

291X. Teaching Participation—Credit is given for assisting a professor in the teaching of a mechanical engineering course. Prerequisite: consent of supervising instructor.

1-3 units, Aut, Win, Spr (Staff)

292. Experimental Investigation of Engineering Problems—Graduate engineering students undertake experimental investigation under guidance of staff member. Previous work under 291 may be required to provide background for experimental program. Faculty sponsor required.

1-5 units, any quarter (Staff)

293. Interdisciplinary Interaction Design—(Same as Computer Science 447.) Small teams develop innovative technology prototypes that combine product and interaction design. Focus is on software and hardware interfaces, interaction, design aesthetics, and some underpinnings of successful design: a reflective, interactive design process, group dynamics of effective interdisciplinary teamwork, and working with users. Prerequisite: 247A.

3-4 units, Spr (Kelley, Winograd)

293X. Human-Computer Interaction: Interaction Design Studio—(Enroll in Computer Science 247A.)

294. Design Forum—Invited speakers address issues of interest to designers. Brief presentation followed by open discussion. Spring Quarter emphasis on manufacturing and design.

1 unit, Aut (Gerdes)

Spr (Milroy)

295. Seminar in Solid Mechanics—Problems in all branches of solid mechanics. All Ph.D. candidates in solid mechanics are normally expected to attend.

1 unit, Aut, Win, Spr (Staff)

296. Manufacturing Systems Engineering Forum—Invited speakers address issues of interest to design and manufacturing engineers. Brief presentations are followed by open discussion. Sponsored by Stanford Engineering Club for Automation and Manufacturing. (SECAM) (AU)

1 unit, Aut, Win, Spr (Beach)

297. Design Theory and Methodology Forum—A mixture of research reports, literature reviews, and designer interviews promote rigorous examinations of the cognitive basis for designer behavior and design tool development.

1 unit, Aut, Win, Spr (Leifer, Mabogunje)

298. Seminar in Fluid Mechanics—(Enroll in Engineering 298.)

299. Practical Training—Educational opportunities in high-technology research and development labs in industry. Qualified graduate students engage in internship work and integrate that work into their academic program. Following internship, work students complete a research report outlining their work activity, problems investigated, key results, and any follow-on projects they expect to perform. Meets the requirements for Curricular Practical Training for Students on F-1 visas.
Student is responsible for arranging own employment. Register under adviser’s section number.

1 unit (Staff)

2-15 units, any quarter (Staff)

301. Thesis—Dissertation for the degree of Ph.D.
2-15 units, any quarter (Staff)

303. Manufacturing and Design—(Same as 103.)

ADVANCED MATHEMATICS AND COMPUTATION ANALYSIS

3 units (Durbin) not given 2000-01

3 units (Moin) not given 2000-01

DESIGN

309. Finite Element Analysis in Mechanical Design—Part I: basic concepts of finite elements, with applications to problems confronted by mechanical designers. Linear static, modal, and thermal formulations are emphasized; nonlinear and dynamic formulations are introduced. Students implement simple element formulations to obtain a deeper understanding of the essential features of this numerical technique. Part II: application of a commercial finite element code in analyzing design problems. Issues: solution methods, modeling techniques features of various commercial codes, basic problem definition. Individual projects focus on the interplay of analysis and testing in product design/development. Prerequisite: ability to program, Mathematics 103, or equivalent. Recommended: 111, or equivalent in structural and/or solid mechanics; some exposure to principles of heat transfer.
3 units (Sheppard) not given 2000-01

310A. Tools for Team-Based Design—(Same as Engineering 310A.)
For graduate students; open to limited SITN/global enrollment. Project-based, exposing students to the tools and methodologies useful for forming and managing an effective engineering design team in a business environment, including product development teams that may be spread around the world. Topics: personality profiles for creating teams with balanced diversity; computational tools for project coordination and management; real time electronic documentation as a critical design process variable; and methods for refining project requirements to ensure that the team addresses the right problem with the right solution. Computer-aided tools are employed for supporting geographically distributed teams. The final project analyzes a set of industry-sponsored design projects for consideration in 310B,C. The investigation includes benchmarking and meetings with industrial clients. The deliverable is a detailed document with specifications for the project and the optimal design team that should work on the project in subsequent quarters.
Limited enrollment, consent of instructor for off-campus (global) registrants.
4 units, Aut (Cutkosky)

310B.C. Design Project Experience with Corporate Partners—(Same as Engineering 310B,C.) Two-quarter project for graduate students who already have some design experience and want in-depth involvement in an entrepreneurial design team with real world industrial partners. The products developed are part of the student’s portfolio. For some projects, 217 and 218 may be prerequisites or co-requisites (see http://me310.stanford.edu for admission guidelines). Each team functions like a small start-up company, working closely with a technical advisory board, consisting of the instructional staff and a coach. Teams use computer-aided tools for project management, communication, and documentation, and are provided a budget for direct expenses including hiring technical assistants and conducting tests. Teams interact with corporate liaisons weekly via site visits, video conferencing, email, fax, and phone. Hardware demonstrations, peer reviews, scheduled documentation releases, and an intense team environment provide the mechanisms and culture for design information sharing. Enrollment by consent of instructor and depends on the results of a pre-enrollment survey in December and the recommendations made by project definition teams in 310A.
4-5 units, Win, Spr (Cutkosky)

311. Engineering: Women's Perspective—Master's and Ph.D.-level seminar series driven by student interests. Possible topics: time management, career choices, health and family, diversity, professional development, and personal values. Graduate students share experiences and examine scientific research in these areas. Guests speakers from academia and industry, student presentations with an emphasis on group discussion. (AU)
1 unit, Win (Sheppard)

313A. Ambidextrous Thinking—Visual and kinesthetic skills are developed and exercised in solving design problems. Quickly executed perspective, orthographic, diagrammatic, and three-dimensional sketches are emphasized in conjunction with fluent and flexible idea production. Exercises to appreciate and develop the entire body's role in creative thinking. Enrollment limited to 60.
3 units, Aut (Paster)

314. Solid State Physics for Mechanical Engineering—Introductory overview of the principles of statistical mechanics, quantum mechanics, and solid-state physics. Provides graduate mechanical engineering students with the understanding needed to work on devices or technologies which rely on solid-state physics.
3 units (Kenny) alternate years, given 2001-02

316A. Advanced Product Design: Formgiving—See 116A. Prerequisites: 313, 303; art.
4 units, Win (Burnett)

316B. Advanced Product Design: Needfinding—See 116B. Prerequisite: consent of instructor.
4 units, Win

316C. Advanced Product Design: Implementation—Prerequisite: 316B.
4 units, Spr

317. Total Product Integration Engineering—Targets students aspiring to be product development executives and leaders in dFM research and education. Students learn advanced methods and tools beyond the material covered in 217: quality design across global supply chain, robust product architecture for market variety and technology advances, product development risk management, etc. Small teams or individuals conduct a practical project that produces either an in-depth case study
using advanced tools or a significant enhancement to the dfM methods and tools. Enrollment limited to 16. Prerequisites: 217A,B. 3 units, Aut (Ishii)

318. Introduction to Mechatronics—See 118.

319. Robotics and Vision Lab—For graduate students with some familiarity in robotics who want project experience with robotic and vision systems. Current topics in robotics and machine vision with applications to flexible, automated manufacturing; emphasis is on integrated problems and techniques for fine motion control, calibration, acquisition of sensory data, and programming. Cell level topics: architectures and strategies for cell control. Research issues: dexterous manipulation and languages for high-level task specification. Typical projects: robotic deburring, assembly using force feedback and/or vision, part inspection, and cell control. Short assignments provide practice with various equipment. Enrollment limited to 30. Prerequisites: 219 or equivalent, some familiarity with programming.
3 units (Staff) not given 2000-01

327B. Introduction to Computer Vision—(Enroll in Computer Science 223B.)

328. Design for Appropriate Technology—See 128.

ADVANCED MECHANICS OF SOLIDS

349. Engineering Quantum Mechanics—Basic quantum mechanics topics necessary for engineering graduate students to understand the atomic, electronic, magnetic, and optical properties of diverse material systems and the fundamental underlying principles of microscopic measurement processes (e.g., STM, MFM, TEM, SNOM, etc.). Topics: electronic bound states, collision theory, symmetry in quantum mechanics, approximation methods, identical particles and spin, electromagnetic field, and relativistic wave equations.
3 units, Sum (Cho)

ADVANCED FLUID MECHANICS

351A. Advanced Fluid Mechanics—For advanced students specializing in fluid mechanics. Topics: kinematics (analysis of deformation, critical points and flow topology, Helmholtz decomposition); constitutive relations (viscous and visco-elastic flows, non-inertial frames); vortex dynamics; circulation theorems, vortex line stretching and rotation, vorticity generation mechanisms, vortex filaments and Biot-Savart formula, local induction approximation, impulse and kinetic energy of vortex systems, vorticity in rotating frame. Prerequisite: graduate-level courses in compressible and viscous flow.
3 units (Staff) not given 2000-01

351B. Advanced Fluid Mechanics—Waves in fluids: surface waves, internal waves, inertial and acoustic waves, dispersion and group velocity, wave trains, transport due to waves, propagation in slowly varying medium, wave steepening, solitons and solitary waves, shock waves. Stability of fluid motion: dynamical systems, bifurcations, Kelvin-Helmholtz instability, Rayleigh-Benard convection, energy method, global stability, linear stability of parallel flows, necessary and sufficient conditions for stability, viscosity as a destabilizing factor. Focus is on flow instabilities. Prerequisites: graduate-level courses in compressible and viscous flow.
3 units (Staff) not given 2000-01

3 units (Staff) not given 2000-01

3 units (Edwards) not given 2000-01

OTHER

381. Biomechanics of Movement—See 181.

382. Modeling and Simulation of Human Movement—Direct experience with the computational tools used to create simulations of human movement. Lecture/labs on animation of movement; kinematic models of joints; forward dynamic simulation; computational models of muscles, tendons, and ligaments; creation of models from medical images; control of dynamic simulations; collision detection and contact models. Prerequisite: 231, 381, or equivalent.
3 units, Spr (Delp, Heegaard) alternate years, not given 2001-02

384. Medical Device Design—See 194.

396. Product Realization Lab: Special Project—Material varies each year, emphasizing design and technique in either foundry work, machining projects, or wood construction.
1 unit, Spr (Milroy)

459. Frontiers in Interdisciplinary Biosciences—Introduction to cutting-edge research involving interdisciplinary approaches to biotechnology; for specialists and non-specialists. Associated with Stanford’s Clark Center for Interdisciplinary Bioscience, and held in conjunction with a seminar series meeting twice monthly during 2000-01. Leading investigators from Stanford and throughout the world speak on their research; students also meet separately to present and discuss the ever-changing subject matter, related literature, and future directions. Prerequisite: keen interest in all of science, with particular interest in life itself. Recommended: basic knowledge of biology, chemistry and physics.
2 units, Aut, Win, Spr (S. Block)

SCIENTIFIC COMPUTING AND COMPUTATIONAL MATHEMATICS PROGRAM

Director: Gene H. Golub
Associate Director: Walter Murray
Core Faculty: Juan Alonso (Aeronautics and Astronautics), Robert Dutton (Electrical Engineering), Ronald Fedkiw (Computer Science), Gene Golub (Computer Science), Joseph B. Keller (Mathematics, emeritus), Walter Murray (Management Science and Engineering), Joseph Oliger (Computer Science), George Papanicolaou (Mathematics); Associate Faculty: Khalid Aziz (Petroleum Engineering), Joel Feziger (Mechanical Engineering), George M. Homsy (Chemical Engineering), Thomas J. Hughes (Mechanical Engineering), Thomas Kailath (Electrical Engineering), T. P. Liu (Mathematics)
Affiliated Faculty: S. Boyd (Electrical Engineering), J. Cioffi (Electrical Engineering), R. Cottle (Management Science and Engineering), T. Cover (Electrical Engineering), G. Dantzig (Management Science and
Engineering, emeritus), A. Dembo (Mathematics), S. Doniach (Applied Physics), D. Donoho (Statistics), C. Eaves (Management Science and Engineering), J. Friedman (Statistics), I. Johnstone (Statistics), J. Koseff (Civil and Environmental Engineering), K. Law (Civil and Environmental Engineering), R. MacCormack (Aeronautics and Astronautics), P. Moin (Mechanical Engineering), A. B. Owen (Statistics), W. Reynolds (Mechanical Engineering, emeritus), B. Roth (Mechanical Engineering), M. Saunders (Management Science and Engineering), C. Steele (Mechanical Engineering), R. Street (Civil and Environmental Engineering)

The Scientific Computing and Computational Mathematics Program (SC/CM) is interdisciplinary and leads to the M.S. and Ph.D. degrees. It is designed for students interested in studying and developing computational tools in those aspects of applied mathematics central to modeling in the physical and engineering sciences. Graduates of this program are expected to be able to deal with a scientific problem from its formulation, moving through its mathematical analysis to algorithm development and implementation. The symbiosis of applied mathematics and numerical computing is stressed.

GRADUATE PROGRAMS

MASTER OF SCIENCE

The University’s basic requirements for the M.S. degree are discussed in the “Graduate Degrees” section of this bulletin.

A candidate must complete a program of 45 units of courses numbered 100 or greater. In addition, a number of courses at the 200 level or above are required. At least 36 of these units must be graded units, passed with a grade point average (GPA) of 3.0 (B) or better. The core curriculum is common to all degrees offered by the program, but is adapted according to the interests and prior education of the student. Deviations from the core curriculum must be justified in writing and approved by the student’s adviser and the SC/CM Committee. Courses that are waived rather than taken may not be counted towards the master’s degree. The student must fulfill credit requirements in each of the categories listed below.

CORE CURRICULUM

1. **Mathematics** (18 units): students are required to take Mathematics 220A,B,C. Nine additional units in math are required with at least 6 units at the 200 level. Suggested courses are Mathematics 173, 205A,B,C, 224, 230, 236, 237, 256A,B,C, 274, 276A,B; Statistics 300A,B,C, 305, 306A,B, 310A,B,C. Other courses can be substituted with consent of the adviser and the SC/CM Committee. Students should take those courses most suitable to their areas of specialization.

2. **Numerical Analysis** (12 units): students are required to take Computer Science 237A,B,C and an advanced course in numerical analysis such as: Computer Science (CS) 335, 336, 337, 339; Management Science and Engineering 312; Mechanical Engineering (ME) 233B, 235A,B,C; Statistics 327.

3. **Computer Science** (6-9 units): students can take a selection of courses from CS 109A,B, 212, 248, 260. This must include a course at the 200 level.

4. **Application Area** (9 units): students must take a focused program in an applications area such as fluid mechanics, operations research, or statistics. Courses must be at the 200 level or higher, and the program of concentration must be approved by the adviser and committee. Examples of suitable courses are: Aeronautics and Astronautics 210A,B, 214A,B,C; Electrical Engineering 363, 364, 365, 378A,B; ME 238A,B, 251A,B, 269.

5. **Seminar** (1 unit): students are required to regularly attend the Scientific Computing/Computational Mathematics seminar for one quarter. The seminar is held weekly during the academic year.

DOCTOR OF PHILOSOPHY

The University’s basic requirements for the Ph.D. degree (residence, dissertation, examination, and so on.) are discussed in the “Graduate Degrees” section of this bulletin. The following are the program’s requirements:

1. Plan and successfully complete a coherent program of study covering the basic areas of Scientific Computing and Computational Mathematics. It must at least satisfy the requirements for the M.S. degree in SC/CM. It is important that the student be able to exhibit depth in some area of application. The student’s adviser has the primary responsibility for the adequacy of the program, which must meet the approval of the SC/CM Committee.

2. To be admitted to candidacy for the Ph.D. degree, a student must have successfully completed 27 units of graduate courses (200 level and above) and at least a 3.3 GPA in the courses. In addition, a student must pass a qualifying examination and find a thesis adviser. The qualifying examination must be taken within one year of admission into the Ph.D. program. The Ph.D. qualifying examination is based on the six required courses, 220A,B,C and 237A,B,C, listed in the core curriculum.

3. Beyond the requirements for candidacy, the student must complete a focused course of study of at least 48 units. The program should be designed to develop a deep, focused background in the research area to be pursued in the dissertation. Approval of the program must be obtained from the SC/CM Committee.

4. In addition, the student must have an adequate knowledge of a coherent area of application and must complete at least 12 units in that area.

5. The most important requirement for the Ph.D. is the dissertation. A reading committee must be selected before the student is admitted to Terminal Graduate Registration (TGR), and this committee should be frequently consulted by the student before the University oral examination. Upon completion of a draft of the dissertation, the student must pass a University oral examination in defense of the dissertation.

Ph.D. MINOR

Students wishing to obtain a Ph.D. minor in the Scientific Computing and Computational Mathematics Program should consult the department office for designation of a minor adviser. A minor in SC/CM may be obtained by completing 20 units of course work, including the sequences Mathematics 220A,B,C and Computer Science 237A,B,C; a GPA of 3.3 or better must be maintained in these courses.

The student’s Ph.D. reading committee and University oral committee must include one faculty member who is associated with the SC/CM program.

COURSES

137. *Introduction to Scientific Computing*—(Enroll in Computer Science 137.) Prerequisites: Computer Science 106A; Mathematics 103 or 113 or equivalents.

3 units, Aut (Fedkiw)

138. *Matlab and Maple for Science and Engineering Applications*—(Enroll in Computer Science 138.)

4 units, Win (Staff)

220A. 3 units, Aut (Levandosky)

220B. 3 units, Win (Levandosky)

220C. 3 units, Spr (Mattingly)

237A,B,C. *Advanced Numerical Analysis*—(Enroll in Computer Science 237A,B,C)

237A. *Numerical Linear Algebra*—Prerequisites: Computer Science 106A, 137; Mathematics 103 or 113.

3 units, Aut (Golub)
237B. Numerical Solution of Initial Value Problems—Prerequisites: Mathematics 130, 131.
   3 units, Win (Oliger)

237C. Numerical Solution of Boundary Value Problems—Prerequisites: Mathematics 130, 131.
   3 units, Spr (Wan)

238. Parallel Methods in Numerical Analysis—(Enroll in Computer Science 238.) Prerequisite: Mechanical Engineering 200A or Computer Science 237A, or consent of instructor.
   3 units, Win (Alonso, Wan)

336. Advanced Methods in Matrix Computation—(Enroll in Computer Science 336.)
   3 units (Golub)

337. Numerical Methods for Initial Boundary Value Problems—
   (Enroll in Computer Science 337.)
   3 units, Spr (Staff)

339. Topics in Numerical Analysis—(Enroll in Computer Science 339.)
   2-3 units, Aut (Van Huffel) alternate years, not given 2001-02
   Win (Golub)

340. SCCM Consulting Workshop
   1-3 units, any quarter (Murray)

398. Curricular Practical Training—Provides students with on-the-job training under the guidance of experienced, on-site supervisors. Students must register the quarter after their training. Students receive credit and a grade after submitting a concise report detailing work activities, problems worked on, and key results. Prerequisite: written consent of adviser.
   1 unit, any quarter (Staff)

399. Independent Project
   any quarter (Staff)

499. Advanced Reading and Research—Prerequisites: majoring in Scientific Computing and Computational Mathematics; consent of instructor.
   any quarter (Staff)

530. Applied Mathematics/Scientific Computing Seminar—(Enroll in Computer Science 530.)
   1 unit, Aut, Win, Spr (Staff)

   1 unit, Aut, Win, Spr (Staff)
School of Humanities and Sciences

Dean: Malcolm R. Beasley
Cognizant Deans: Keith Baker, Russell Berman, John Brauman
Associate Dean for Development: Robert Franklin
Assistant Deans: Judith Cain, Roni Holotien, Geneve Lopez
Department Chairs: Carl Bielefeldt (Religious Studies), Robert Byer (Applied Physics), Carolyn Lougee Chappell (History), Steve Chu (Physics), Gregory Freidin (Slavic Languages and Literatures), Thomas Grey (Music), H. Craig Heller (Biological Sciences), Mark R. Lepper (Psychology), Stanley Peters (Linguistics), Robert M. Polhemus (English), Michael Ramsaur (Drama), Orrin Robinson (German Studies), Kristine Samuelson (Communication), Jeffrey Schnapp (French and Italian), David Siegmund (Statistics), Leon Simon (Mathematics), George Somero (Hopkins Marine Station), Susan Stephens (Classics), Chao Fen Sun (Asian Languages), Barry Trost (Chemistry), Richard Vinograd (Art and Art History), Sylvia Yanagisako (Cultural and Social Anthropology), Yvonne Yarbro-Bejarano (Spanish and Portuguese), Andrew Walder (Sociology), Barry R. Weingast (Political Science), Gavin Wright (Economics); Anthropological Sciences, Comparative Literature, Philosophy to be announced

The School of Humanities and Sciences, with over 40 departments and interdepartmental degree programs, is the primary focus for the superior liberal arts education offered by Stanford University. Through exposure to the humanities, undergraduates study the ethical, aesthetic, and intellectual dimensions of the human experience, past and present, and so are prepared to make thoughtful and imaginative contributions to the culture of the future. Through the study of social, political, and economic events, they acquire theories and techniques for the analysis of specific societal issues, as well as general cross-cultural perspectives on the human condition. And through exposure to the methods and discoveries of mathematics and the sciences, they will become better-informed participants and leaders in today’s increasingly technological societies.

Further, the exciting research environment within the school offers both undergraduates and graduate students the intellectual adventure of working on their own research projects side by side with the school’s distinguished faculty. While a few of the school’s graduate programs offer professional degrees such as the Master of Fine Arts, most are academic and research programs leading to the Ph.D. Doctoral programs emphasize original scholarly work by the graduate students, often at the frontiers of knowledge, and normally require the students to participate in the supervised teaching of undergraduates. Indeed, in the school, as in the University more broadly, graduate students are of central importance in developing a community of scholars.

The fact that so many different disciplines lie within the same organization is one reason why the school has had great success in promoting interdisciplinary teaching and research programs. Whether engaged in studies as wide ranging as ethics, policy, and technological issues, or by applying contemporary social and philosophical theories to classical literature, our undergraduates, graduate students, and faculty are challenging the barriers among scholarly disciplines. The school will continue to strive for a balance between teaching and research, the academy and society.

ORGANIZATION

The School of Humanities and Sciences includes the departments of Anthropological Sciences, Applied Physics, Art and Art History, Asian Languages, Biological Sciences (and the Hopkins Marine Station), Chemistry, Classics, Communication, Comparative Literature, Cultural and Social Anthropology, Drama, Economics, English, French and Italian, German Studies, History, Linguistics, Mathematics, Music, Philosophy, Physics, Political Science, Psychology, Religious Studies, Slavic Languages and Literatures, Sociology, Spanish and Portuguese, and Statistics.

The school also includes 16 interdepartmental degree programs: African and African American Studies; American Studies; Comparative Studies in Race and Ethnicity; East Asian Studies; Human Biology; Feminist Studies; Interdisciplinary Studies in Humanities; International Studies; International Relations; Latin American Studies; Mathematical and Computational Science; Modern Thought and Literature; Public Policy; Russian and East European Studies; Science, Technology, and Society; Symbolic Systems; and Urban Studies.

In addition, the school sponsors programs that do not currently grant degrees: African Studies, Astronomy, Black Performing Arts, Ethics in Society, History and Philosophy of Science, Jewish Studies, Medieval Studies, Overseas Studies, the Social Science History Institute, and Undergraduate Research Opportunities. Faculty and academic staff of the School of Humanities and Sciences are listed under the respective departments or programs.

DEGREES OFFERED

Candidates for the degree of Bachelor of Arts, Bachelor of Science, Bachelor of Arts and Sciences, Master of Arts, Master of Fine Arts, Master of Science, Doctor of Musical Arts, or Doctor of Philosophy should consult appropriate sections of the announcements following. They should consult also the department or program in which they intend to specialize.

PROGRAM IN AFRICAN AND AFRICAN AMERICAN STUDIES

Director: John R. Rickford
Associate Director: Diann W. McCants
Advisory Committee: (Committee Chair) Arnold Rampersad (English); David Abernethy (Political Science), Clay Carson (History), Sandra Drake (English), Morris Graves (Associate Dean of Students), Jerri Kay (African and African American Studies), Kimberly Melton (African and African American Studies), Elaine C. Ray (Assistant Director, University Communications), Michael Thompson (History)

UNDERGRADUATE PROGRAMS

BACHELOR OF ARTS

The African and American Studies (AAAS) program covers a vast and varied field, including: (I) the history, literature, culture, and social science of African Americans as a central component of American culture; and (II) the history, literature, culture, and social science of the peoples of Africa and the African Diaspora. AAAS is an indispensable subject for those interested in the cultural, economic, historical, political, or social study of the United States.

To investigate the rich and varied human tapestry which AAAS spans, students are encouraged to use interdisciplinary methods drawn from anthropology, art, art history, economics, languages, linguistics and literature, music, philosophy, political science, psychology, religion, and sociology, among others. A degree in AAAS prepares students for the many work positions requiring a broad liberal arts perspective, as well as those requiring the specialized knowledge that AAAS offers. Students in AAAS receive training that is especially valuable for graduate study and/or careers in such fields as business, comparative literature, creative writing, education, journalism, law, linguistics, medicine, performing arts, politics, social sciences, social work, and urban studies. The program emphasizes creative scholarship and research through various means.

The AAAS Major—All majors and double majors are expected to complete a total of 60 units, of which 25 units must be selected from the AAAS core courses (AAAS 105 and 187N are mandatory). Since AAAS is affiliated with the program in Comparative Studies in Race and Eth-
nicity (CSRE), AAAS students must also enroll in two CSRE core introductory courses and complete a CSRE senior seminar (a writing intensive course of 5 units) before graduating. Additionally, 20 units are to be selected from areas I (African American Studies) or II (African and the African Diaspora), or a special program, area III, devised by the student. No more than two courses of a general nature (for example, Sociology 145, which deals with race and ethnicity, but without a primary African or African American focus) may be counted towards the major. All majors must include at least one course from area I and II. Each of these options consolidates and broadens the work of the core. Students who choose option III may devise a program with a special theme. This choice allows the student to use up to 20 units to explore issues encountered in other courses in greater depth, or to strike out in new directions. Students who choose option III should work closely with an adviser and must have written approval from the director of the program.

**Directed Reading**—AAAS 190A, B, C allows students to focus up to 10 units of work on a special topic of interest. In organizing this plan, the student consults with the program director and a faculty member specializing in the area or discipline.

**CORE COURSES**

The core consists of 25 units, including the two required courses (*), and 15 additional units selected from the following list:

**SOCIAL SCIENCES**

Area I minors must choose at least two courses below.

**Anthropological Sciences:**

105. Race, Gender, and Biology

**Economics:**

116. American Economic History

**Education:**

141. Race, Education, and the Media

156X. Understanding Racial and Ethnic Identity

175X. African American English in Educational Context

193C. Peer Counseling: The African American Community

201A. History of African American Education through 1940

201B. Education for Liberation

**Cultural and Social Anthropology:**

88. Theories of Race and Ethnicity: A Comparative Perspective

**Linguistics:**

73. African American Vernacular English

173. African American English in Educational Context

**Political Science:**

179G. Black Politics in the Post-Civil Rights Era

192F. Seminar Political of Race and Ethnicity in the United States

196. Issues of Race in American Politics

197P. Seminar: Political Beliefs and Values of Black Americans

197S. Seminar: Prejudice and Group Conflict

296. Seminar: Racial and Ethnic Politics in the U.S.

**Psychology:**

174. African American Psychology

175. Seminar on Topics in Identity Development

180. Social Psychological Perspectives on Stereotyping and Prejudice

**Sociology:**

145. Race and Ethnic Relations

149. The Urban Underclass

**HUMANITIES**

Area I minors must choose at least two courses below.

**Drama (Dance):**

44. Jazz Dance I

44. Jazz Dance II

45. Jazz Dance III

156. Contemporary Ethnic Drama

163. Performance and America

**English:**

161A. Afro-American Writing. 1950-1970

162G. Writings by 20th-Century Women of Color

162H. Literature of African Diaspora

168B. Introduction to Afro-American Literature

187B. Seminar: Central issues in African American Intellectual History

187N. Seminar: W.E.B. Du Bois and American Culture (same as AAAS 187N)

**History:**

47Q. Stanford Introductory Seminar: The Language of African American Names—A History of Naming Traditions

50N. Stanford Introductory Seminar: The Black Atlantic

51S. Sources and Methods Seminar: The Politics of Self-Definition—Ethnic Nationalism in the Civil Rights Era

57Q. Stanford Introductory Seminar: Martin Luther King, Jr.—Interactive

61. The Constitution and Race

64. Introduction to Race and Ethnicity in the American Experience

65. Comparative Studies in Race and Ethnicity

147B. The Idea of Africa among African Americans

150A. African American History to the 20th Century

150B. Introduction to African American History: The Modern Black Freedom Struggle

157. Introduction to African American History: The Modern Black Freedom Struggle

165A. Colonial and Revolutionary America

165B. 19th-Century America

165C. The United States in the 20th-Century

200M. Undergraduate Directed Research: Martin Luther King, Jr. Papers Project

249. Undergraduate Colloquium: Religions, Cultures, and History in West Africa and the African Americas

249A. Undergraduate Colloquium: The Issue of Greatness in Black History

249B. Undergraduate Colloquium: Black Visual Arts and Black History

250. Undergraduate Colloquium: American Popular Culture

250C. Undergraduate Colloquium: Thomas Jefferson and His World

252S. Undergraduate Research Seminar: Museums and History

253A. Undergraduate Colloquium: Culture and Ideologies of Race

259. Undergraduate Colloquium: Black and White in the United States and South Africa

263B. Undergraduate Colloquium: The Making of the Atlantic World, 1600-1960

264S. Undergraduate Research Seminar: The Papers of Martin Luther King, Jr. and the Modern Civil Rights Movement

269. Undergraduate Colloquium: The African-American Community Organizing Tradition

**Music:**

18A. Jazz History: Ragtime to Bebop (1900-1945)

18B. Jazz History: Bebop to Present (1940-)

20A. Jazz Theory

20R. Advanced Jazz Theory

161B. Jazz Ensemble

**Philosophy:**

177. Philosophical Issues Concerning Race and Racism

**Religious Studies:**

2N. Stanford Introductory Seminar: Prophecy and Politics in America—The Religious Thought of Abraham Joshua Heschel and Martin Luther King, Jr.

163. Religion and Ethnicity
AREA II: AFRICAN HISTORY, CULTURE, AND SOCIETY: HISTORY, CULTURE, AND SOCIETY OF THE BLACK DIASPORA

Area II majors choose at least 20 units in addition to the cores selected from the following lists, plus at least one course from the Area I list (above):

AFRICAN AND AFRICAN AMERICAN STUDIES
106A. African and African American Lecture Series
106B. African and African American Lecture Series
106C. African and African American Lecture Series
107. African and African American Learning Expedition: Ghana

SOCIAL SCIENCES
Area II minors must choose at least two courses below.

Cultural and Social Anthropology:
72. Dance and Culture in Latin America
88. Theories of Race and Ethnicity

Linguistics
185/285. Structure of an African Language

Political Science:
25. Colonialism and Nationalism in the Third World
118A. Political Change in Tropical Africa
118B. The Politics of Race and Class in Southern Africa

HUMANITIES
Area II minors must choose at least two courses below.

Comparative Literature:
103. Egyptian East/Egyptian West
170E. Introduction to African Systems of Thought

Drama (Dance):
43. Afro-Brazilian and Afro-Peruvian Dance
143. Afro-American Roots of American Concert Dance

English:
161E. Modern African Writing in English
162H. Literature of the African Diaspora
187T. Literature of South Africa

French and Italian:
133. Literature and Society in Africa and the Caribbean

History:
48Q. Stanford Introductory Seminar: South Africa—Contested Transitions
50N. Stanford Introductory Seminar: The Black Atlantic
50S. Sources and Methods Seminar: Race and Popular Culture (in Black and White)
57Q. Stanford Introductory Seminar: Martin Luther King, Jr.—Interactive
61. The Constitution and Race
65. Introduction to Comparative Studies in Race and Ethnicity
118B. The Politics of Race and Class in Southern Africa
147A. African History in Novels and Film
147B. The Idea of Africa among Africans
148. Introduction to African History
148C. Africa in the 20th Century
246. Undergraduate Colloquium: Successful Futures for Africa—An Inventory of the 1990s-2000s
246D. Undergraduate Colloquium: The Social History of Southern Africa
246S. Undergraduate Colloquium: Popular Culture in Africa
247. Undergraduate Colloquium: Greater East Africa and its Historical Writing
247A. Undergraduate Colloquium: African Identity in a Changing World
247B. Undergraduate Colloquium: Health and Society in Africa
247C. Undergraduate Colloquium: Africa and African Americans since World War II
247D. Undergraduate Colloquium: African Coiffure and its Legacy in the Americas
247S. Undergraduate Research Seminar: The Great Mau Mau Rebellion in 1950s Kenya
248. Undergraduate Colloquium: Governance and Civil Society in Africa
248A. Undergraduate Colloquium: The End of Slavery in Africa and the Americas
248D. Law and Colonialism in Africa
248S. Undergraduate Research Seminar: Colonial States and Societies in Africa
249A. Undergraduate Colloquium: The Issue of Greatness in Black History
249B. Undergraduate Colloquium: Black Visual Arts and Black History
249D. Undergraduate Colloquium: African Cultural History in the 20th Century

Language Center:
100A,B, C. Beginning Amharic
102A, B, C. Beginning Hausa
103A, B, C. Intermediate Hausa
107A, B, C. Beginning Swahili
107A, B, C. Intermediate Swahili
108A, B, C. Advanced Swahili
111A,B, C. Beginning Chichewa
133A, B, C. The African Evening Forum

Overseas Studies—Paris:
76. Contemporary African Literature in French

Political Science:
118B. The Politics of Race and Class in Southern Africa

Religious Studies:
110. Islam in the Modern World

Spanish and Portuguese:
171/272. Black Literature in Brazil

SENIOR SEMINAR

All AAAS majors must take at least one quarter of the CSRE Senior Seminar (see complete description of the seminar in the “Comparative Studies in Race and Ethnicity” section of this bulletin).

MINORS

Students who minor in AAAS must complete either (1) a total of six courses of 3 or more graded units, or (2) a minimum of 25 graded units from the list of AAAS courses listed above. The courses must include AAAS 105 and at least one course from the social sciences and one from the humanities. Students should develop a coherent theme in their course selections, in consultation with the program director or associate director.

AAAS stresses academic advising. The director or associate director advises all AAAS students, including majors, minors, and double majors. Additionally, majors and double majors have the opportunity to participate in individual and group mentoring activities offered by CCSRE. The program prides itself on its responsiveness to student concerns, and its Advisory Committee includes both faculty and student representation.

HONORS

Majors who have maintained at least 3.3 grade point average (GPA) or higher in the major may apply for the honors program. Students should apply in the Spring Quarter of their junior year for the honors program. The honors thesis is intended to enable students to synthesize several of the skills they have acquired and to produce a document or project demonstrating some measure of competence in their specialty. The honors thesis must be discussed with and approved by the major adviser and the program director. A student may receive 5-15 units for the honors thesis. All students completing an honors thesis must participate in at least two quarters of the CSRE Senior Seminar.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

106A, B, C. African and African American Studies Lecture Series—Weekly lectures on aspects of African or African American artistic expression, culture, history, language, literature, music, politics, religion, society, or sport. One unit for attendance at lectures and submission of brief reports on each. Additional units require participation in preparatory and discussion sections, readings, and the opportunity to conduct and record biographical interviews with speakers in the lecture series for...
the AAAS archives. Students taking 107 must enroll in 106B for 4 units.
1-3 units, Aut (Rickford)
Win (Jackson)
Spr (McCants)

107. African and African American Studies Learning Expedition—
Third in a series of annual expeditions to regions of historical and/or
sociocultural interest in Africa and the African diaspora, this year to
expedition required for credit. Prerequisite: 106B for 4 units.
1 unit, Spr (Staff)

190A,B,C. Directed Reading
5-15 units, Aut, Win, Spr (Staff)

199A,B,C. Honors Project
5-15 units, Aut, Win, Spr (Staff)

AFFILIATED DEPARTMENT OFFERINGS
See the respective department listings for course descriptions and
General Education Requirements (GER) information.

COMPARATIVE LITERATURE
171. Comparative Narrations of Race, Ethnicity, and Nation
3-5 units (Palumbo-Liu) not given 2000-01

COMPARATIVE STUDIES IN RACE AND ETHNICITY
203. Race and Education: Strategies for Change in the 21st Century
5 units, Spr (Montoya, Steyer)

DRAMA
163. Performance and America
5 units, Aut (Elam)

DANCE
43. Afro-Brazilian and Afro-Peruvian Dance
1 unit, Aut (Cashion)

44. Jazz Dance I
1 unit, Aut, Win, Spr (Kramer)

143. Afro-American Roots of American Concert Dance
2 units, Win (Moses)

144. Jazz Dance II
1 unit, Aut, Spr (Moses)

EDUCATION
141. Race, Education, and Media
5 units (Carnoy, Steyer) not given 2000-01

156X. Understanding Racial and Ethnic Identity
5 units (LaFromboise) not given 2000-01

175X. African-American English in Educational Context—(Same as
275.)
3 units (Baugh) not given 2001-02

193C. Peer Counseling: The African-American Community
2 units, Aut (Edwards, Reede-Hoskins)

201A. History of African American Education through 1940
3 units (Williamson) given 2001-02

201B. Education for Liberation
3 units (Williamson) given 2001-02

ENGLISH
126. 20th Century American Fictions
5 units, Win (Saldivar)

161A. African American Writing, 1950-1970
5 units, Win (Drake)

161E. Modern African Writing in English
5 units, Spr (Drake)

162H. Literature of the African Diaspora
5 units, Win (D. Jones)

168B. Introduction to Afro-American Literature
5 units, Win (Rampersad)

187B. Seminar: Central Issues in African American Intellectual
History
5 units, Spr (Drake)

187N. Seminar: W. E. B. Du Bois and American Culture
5 units, Win (Rampersad)

HISTORY
50S. Sources and Methods Seminar: Race and Popular Culture (in
Black and White)
5 units (M. Thompson) not given 2000-01

51S. Sources and Methods Seminar: The Politics of Self-Definition—Ethnic Nationalism in the Civil Rights Era
5 units, Spr (Chavez)

61. The Constitution and Race
5 units (Rakove) not given 2000-01

65. Introduction to Comparative Studies in Race and Ethnicity
5 units, Spr (Camarillo)

147A. African History in Novels and Film
5 units (Jackson) not given 2000-01

147B. The Idea of Africa among African Americans
5 units (Jackson) not given 2000-01

148. Introduction to African History
5 units, Aut (Jackson)

148C. Africa in the 20th Century
5 units, Spr (R. Roberts)

150A. African-American History to the 20th Century
5 units, Aut (M. Thompson)

150B. Introduction to African-American History: The Modern Black
Freedom Struggle
5 units, Spr (Carson)

165A. Colonial and Revolutionary America
5 units, Aut (Wells)

165B. 19th-Century America
5 units, Win (White)

165C. The United States in the 20th Century
5 units, Spr (Kennedy)

200M. Undergraduate Directed Research: Martin Luther King, Jr.
Papers Project
units by arrangement (Carson)
246. Undergraduate Colloquium: Successful Futures for Africa—An Inventory of the 1990s-2000s
5 units, Spr (Jackson)

246S. Undergraduate Research Seminar: Popular Culture in Africa
5 units (Jackson) not given 2000-01

247. Undergraduate Colloquium: Greater East Africa and its Historical Writing—(Same as 347.)
5 units (Jackson) not given 2000-01

247A. Undergraduate Colloquium: African Identity in a Changing World
5 units (R. Roberts) not given 2000-01

247B. Undergraduate Colloquium: Health and Society in Africa
5 units (R. Roberts) not given 2000-01

247C. Undergraduate Colloquium: Africa and African Americans since World War II
5 units (Jackson) not given 2000-01

247D. Undergraduate Colloquium: African Coiffure and its Legacy in the Americas
4 units, Aut (Jackson)

247S. Undergraduate Research Seminar: The Great Mau Mau Rebellion in 1950s Kenya—(Same as 447.)
5 units (Jackson) not given 2000-01

248. Undergraduate Colloquium: Governance and Civil Society in Africa
5 units, Win (R. Roberts)

248A. Undergraduate Colloquium: The End of Slavery in Africa and the Americas
5 units (R. Roberts) not given 2000-01

248D. Undergraduate Colloquium: Law and Colonialism in Africa
5 units (R. Roberts) not given 2000-01

248S. Undergraduate Research Seminar: Colonial States and Societies in Africa
5 units, Win, Spr (R. Roberts)

249A. Undergraduate Colloquium: The Issue of Greatness in Black History
5 units (Jackson) not given 2000-01

249B. Undergraduate Colloquium: Black Visual Arts and Black History
5 units (Jackson) not given 2000-01

249D. Undergraduate Colloquium: African Culture History in the 20th Century
5 units, Win (Jackson)

250. Undergraduate Colloquium: American Popular Culture
5 units, Win (M. Thompson)

250C. Undergraduate Colloquium: Thomas Jefferson and His World
5 units (Rakove) not given 2000-01

252S. Undergraduate Research Seminar: Museums and History
5 units (Corn) not given 2000-01

253. Undergraduate Colloquium: Topics in African American History—The Great Migration
5 units (M. Thompson) not given 2000-01

255A. Undergraduate Colloquium: Culture and Ideologies of Race
5 units, Aut (M. Thompson)

257. Undergraduate Colloquium: Immigrants and Racial Minorities in American Cities—Comparative Perspectives
5 units (Carson) not given 2000-01

259. Undergraduate Colloquium: Race and Ethnicity in the United States and South Africa
5 units (Frederickson) not given 2000-01

264S. Undergraduate Colloquium: Martin Luther King, Jr. and the Modern Civil Rights Movement
5 units (Carson) not given 2000-01

269. Undergraduate Colloquium: The African American Community Organizing Tradition
5 units (Carson) not given 2000-01

LINGUISTICS
73. African American Vernacular English
3 units (Rickford) alternate years, given 2001-02

MUSIC
18. Jazz History
18B. Bebop to Present (1940-)
3 units, Spr (Berry)

20A. Jazz Theory
3 units, Aut (Nadel)

161B. Jazz Orchestra
1 unit, Aut, Win, Spr (Berry)

POLITICAL SCIENCE
25. Colonialism and Nationalism in the Third World
5 units (Abernethy) given 2001-02

118A. Political Change in Tropical Africa
5 units (Abernethy) given 2001-02

118B. The Politics of Race and Class in Southern Africa
5 units, Aut (Abernethy)

179G. Black Politics in the Post-Civil Rights Era
5 units, Win (Gay)

192F. Seminar: Politics of Race and Ethnicity in the United States
5 units (Fraga) not given 2000-01

196. Issues of Race in American Politics
5 units (Sniderman) not given 2000-01

197P. Seminar: Political Beliefs and Values of Black Americans
5 units, Win (Sniderman)

197S. Seminar: Prejudice and Group Conflict
5 units (Sniderman) not given 2000-01

PSYCHOLOGY
174. African American Psychology
3-4 units, Aut (McCants)

175. Seminar on Topics in Identity Development
3 units, Win (McCants)

180. Social Psychological Perspectives on Stereotyping and Prejudice
4 units (Eberhardt) alternate years, given 2001-02
OVERSEAS STUDIES

Courses approved for the African and African American Studies major and taught overseas can be found in the “Overseas Studies” section of this bulletin, or in the Overseas Studies office, 126 Sweet Hall.

PARIS

186F. Contemporary African Literature in French
4 units, Win (Rullier)

AFRICAN STUDIES

Emeriti: Paul F. Basch (Medicine), James L. Gibbs, Jr., Raymond D. Giraud, Joseph H. Greenberg, Bruce F. Johnston, Hans N. Weiler, Sylvia Wynter

Chair: Richard Roberts

Professors: David B. Abernethy (Political Science), Jean-Marie Apostolidis (French and Italian), Russell Berman (Comparative Literature, German Studies), Joan Bresnan (Linguistics), Martin Carnoy (Education), George M. Fredrickson (History), William B. Gould (Law), William R. Leben (Linguistics), Valentin Mudimbe (French and Italian, Comparative Literature), Scott R. Pearson, Richard Randell (Art and Art History), John Rickford (Linguistics, African and African American Studies), Richard Roberts (History)

Associate Professors: Sandra E. Drake (English), Akhil Gupta (Cultural and Social Anthropology), Karen A. Jackson, Jr. (History), Bruce Lusignan (Electrical Engineering), Elisabeth Mudimbe-Boyi (French and Italian, Comparative Literature)

Assistant Professors: Paulla A. Ebron (Cultural and Social Anthropology), Sonia Grier (Business), Joanna Mountain (Anthropological Sciences), Karen Mundy (School of Education)

Associate Professor (Research): David Katzstein (School of Medicine)

Senior Lecturer: Khalil Barhoum (Linguistics)

Consulting Professor: Joel Samoff (Center for African Studies)

Visiting Associate Professor: Ebrahim Moosa (Religious Studies)

Curators: Peter Duignan (Senior Fellow, emeritus, Hoover Institution), Karen Fung (Deputy Curator, Hoover Institution), Thomas Seligman (Director, Stanford Museum of Art and Lecturer, Department of Art and Art History)

Senior Research Fellows: Larry Diamond (Hoover Institution), Stephen Stedman (CISAC)

The Committee on African Studies coordinates an interdisciplinary program in African Studies for undergraduate and graduate students. Under special arrangement with the Stanford/Berkeley Joint Center for African Studies, it is possible to incorporate courses from both institutions into one’s program. Contact the center at (650) 723-0295 for a listing of courses offered at the University of California at Berkeley.

Courses in African Studies are offered by departments and programs throughout the University. Each year the committee sponsors a seminar to demonstrate to advanced undergraduate and graduate students how African topics of interest in African Studies are approached from different disciplinary perspectives. Each week’s presentation is conducted by a different professor, the first hour is a lecture, followed by a one-hour seminar discussion.

Course offerings in African languages are also coordinated by the Committee on African Studies. Along with regular courses in several levels of Swahili and Arabic, the committee arranges with the Special Language Program in the Stanford Language Center to offer instruction in other African languages. In recent years, the Special Language Program has offered courses in Bambara, Chichewa, Ewe, Fulani, Hausa, Maninka, Northern Sotho, Shona, and Wolof.

The Committee on African Studies does not sponsor degree programs, but undergraduates and graduate students can specialize in African Studies under a number of arrangements listed below.

UNDERGRADUATE PROGRAMS

Undergraduates may choose an African Studies focus among several alternatives:

1. A major in a traditionally defined academic department (for example, Anthropological Sciences, Cultural and Social Anthropology, History, Political Science, ...). These departments afford ample opportunity to enroll in courses outside the major, leaving the student free to pursue the interdisciplinary study of Africa.

2. Interdepartmental majors, such as African and African American Studies or International Relations, which offer coordinated and comprehensive interdisciplinary course sequences, permitting a concentration in African Studies.

3. An individually designed major. Under the supervision of a faculty adviser and two other faculty members, the student can plan a program of study focused on Africa that draws courses from any department or school in the University. If approved by the Dean’s Advisory Committee on Individually Designed Majors, the program becomes the curriculum for the A.B. degree.

Undergraduates can study for a year in Africa. In recent years, students have enrolled at the University of Cape Town, South Africa; University of Ghana at Legon; University of Nairobi, Kenya; and at Université du Benin, Togo. Students should check with the Overseas Studies office to see what arrangements are currently available.

MINORS

The Committee on African Studies awards a minor in African Studies. Students majoring in any field qualify for this minor by meeting the following requirements:

1. Taking a minimum of 25 units of African-related courses. Students may not overlap ("double-count") courses for completing major and minor requirements.

2. Having at least one quarter’s exposure to an African language. Africa is a linguistically heterogeneous region, and most Africans are multi-lingual. Learning an African language is an excellent way to learn about African cultures. The Center for African Studies and the Special Languages Program may arrange instruction in any of several languages spoken in West, East, Central, and Southern Africa.

3. Completing one introductory course that deals with more than one region of Africa.

4. Writing a 25-35 page research paper. This paper may be an extension of a previous paper written for an African Studies course.

5. Designate a focus of study (either disciplinary or regional) through a three course concentration.

Upon satisfactory completion of all requirements, final certification of the minor is made by the Center for African Studies and appears on the student’s transcript. For more information, call the Center for African Studies at (650) 723-0295 or see the Center’s website at http://www-leland.stanford.edu/dept/AFR/.

CERTIFICATE

Students may also choose to apply for a certificate in African Studies. Requirements for the certificate are the same as for the minor; however, students may double-count courses applied toward their major or graduate studies. The principal difference between the minor and the certificate, however, is that the certificate will not appear on one’s transcript. For more information and an application, please contact the center.

GRADUATE STUDY

For those who wish to specialize in Africa at the graduate level, African Studies can be designated a field of concentration within the master’s and doctoral programs of some academic departments. Students in the departments of Anthropological Sciences, Cultural and Social Anthropology, History, Political Science, and Sociology, and in the School of Education, may declare African Studies as the area of specialization for their master’s and Ph.D. thesis work. Some other departments, programs, and institutes such as International Policy Studies and the Inter-
national Comparative Education Program also permit students to specialize in African Studies. Stanford graduate students who are U.S. citizens or permanent residents may request an academic year application for a Foreign Language and Area Studies (FLAS) Fellowship from the Center at (650) 723-0295. The academic year FLAS application deadline is mid-January. For summer FLAS applications the deadline is mid-April. Students need not be enrolled at Stanford to apply for the summer Fellowship.

AFFILIATED DEPARTMENT OFFERINGS

See respective department listings for course descriptions and General Education Requirements (GER) information.

AFRICAN AND AFRICAN AMERICAN STUDIES

105. Introduction to African and African American Studies
5 units, Spr (McCants)

106ABC. African and African American Studies Lecture Series
1-3 units, Aut, (Rickford)
Win (Jackson)
Spr (McCants)

107. African and African American Studies Learning Expedition
1 unit, Spr (Staff)

CULTURAL AND SOCIAL ANTHROPOLOGY

88. Theories of Race and Ethnicity: A Comparative Perspective
5 units, Win (Yanagisako)

133A,B,C. Ethics of Development in a Global Environment (EDGE)—
(Same as Engineering 297A,B,C)
1-4 units, Aut, Win, Spr (Lusignan, Gupta)

DRAMA

43. Afro-Brazilian and Afro-Peruvian Dance
1 unit, Aut (Cashion)

143. Afro-American Roots of American Concert Dance
2 units, Win (Moses)

EDUCATION

107. Seminar: The Politics of International Cooperation in Education
3-4 units, Spr (Mundy)

136. World, Societal, and Educational Change: Comparative Perspectives
4-5 units (Ramirez) not given 2000-01

202. Introduction to Comparative and International Education
4-5 units, Aut (Mundy)

2021. Education Policy Workshop in International and Comparative Education
2-3 units, Aut (Mundy)

306A. Education and Economic Development
5 units, Win (Carnoy)

306B. The Politics of International Cooperation in Education
3-4 units, Spr (Mundy)

314. Workshop in Economics of Education
1-2 units, Aut, Win, Spr (Carnoy)

405. Education and Political Change
4-5 units (Mundy) not given 2000-01

ENGLISH

68B/168B. Introduction to Afro-American Literature
3 or 5 units, Win (Rampersad)

FRENCH AND ITALIAN

133. Literature and Society: Introduction to Francophone Literature from Africa and the Caribbean
4 units, Win (Boyì)

HISTORY

148. Introduction to African History
5 units, Aut (Jackson)

148B. Northeast Africa and the Red Sea: Imperialism, Regional Identities, Postcolonial Conflicts
5 units, Win (Killion)

148C. Africa in the 20th Century
5 units, Spr (R. Roberts)

150A. African-American History to the 20th Century
5 units, Aut (M. Thompson)

246/346. Undergraduate/Graduate Colloquium: Successful Futures for Africa—An Inventory of the 1990s-2000s
5 units, Spr (Jackson)

247D/347D. Undergraduate/Graduate Colloquium: African Coiffure and Its Legacy in the Americas
4 units, Aut (Jackson)

248. Undergraduate Colloquium: Governance and Civil Society in Africa
5 units, Win (R. Roberts)

248S/448A. Undergraduate/Graduate Research Seminar: Colonial States and African Societies
5 units, Win, Spr (R. Roberts)

249D/349D. Undergraduate/Graduate Colloquium: African Cultural History in the 20th Century
5 units, Win (Jackson)

305. Graduate Workshop in Teaching
1 unit, Spr (R. Roberts)

306B. Design and Methodology for International Field Research
1 unit, Win (Kollman, R. Roberts)

347B. Graduate Core Colloquium in African History: The Colonial Period
4-5 units, Aut (R. Roberts)

LANGUAGE CENTER

SPECIAL LANGUAGE PROGRAM

106A,B,C. Beginning Swahili
106A. 4 units, Aut (Staff)
106B. 4 units, Win (Staff)
106C. 4 units, Spr (Staff)

107A,B,C. Intermediate Swahili
107A. 4 units, Aut (Staff)
107B. 4 units, Win (Staff)

SCHOOL OF HUMANITIES AND SCIENCES

AMERICAN STUDIES

Administrative Committee: (Chair) Barton J. Bernstein (History); Rudy Busto (Religious Studies), Albert Camarillo (History), Gordon Chang (History), Joseph Corn (American Studies Program Coordinator), Wanda Corn (Art and Art History), Arnold Eisen (Religious Studies), on leave), Jay Fliegelman (English), George Fredrickson (History), Richard Gillam (American Studies Program Coordinator), Doug McAdam (Sociology), Alexander Nemerov (Art and Art History), Jack Rakove (History), Ramon Saldivar (English, and Comparative Literature), William Solomon (English), Richard White (History), Gavin Wright (Economics).

The American Studies program is administered through the office of Interdisciplinary Studies in Humanities; see http://www.stanford.edu/group/HSPI/AmStud/.

UNDERGRADUATE PROGRAMS

BACHELOR OF ARTS

The purpose of the American Studies program is to provide students with a comprehensive and critical interdisciplinary understanding of the American experience. The program builds on a series of core courses emphasizing intellectual and cultural as well as historical and legal analysis. American Studies is also a broadly multicultural major that gives serious curricular attention to issues of diversity, especially as raised by distinctions of race, class, ethnicity, and gender. All majors take an intensive seminar, "Perspectives on American Identity," that explores the tension between commonality and difference, and society and group, from a variety of disciplinary perspectives. The program stresses the study of multiculturalism in depth as well as breadth by requiring students to take at least two approved classes focusing specifically on race and ethnicity. Majors who take five or more such courses have the option of graduating with a race and ethnicity specialization in American Studies.

All American Studies majors work closely with a faculty coordinator to develop an independent study plan consisting of 14 (or more) courses totaling at least 60 units. All are to be taken for a letter grade. Study plans must emphasize one of four general concentrations or areas of interest (History and Society; Literature and Thought; Visual and Material Culture; and Politics, Policy, and Economics).

Concentration Requirements—All majors must take a total of eleven courses in four areas of concentration: (1) History and Society; (2) Literature and Thought; (3) Visual and Material Culture; and (4) Politics, Policy, and Economics. These eleven courses, in all cases, include American Studies 150, and History 165A and 165B, plus two courses to satisfy the race and ethnicity requirement (described in the section below). In addition, majors must meet the following minimum distribution requirements: five courses sufficient to provide a solid grounding in a chosen area of concentration; six courses in the other three areas, with at least one course in each area.

Seminar Requirements—All majors must take American Studies 200, Perspectives on American Identity, plus a second seminar (or colloquium) requiring a substantial paper. Neither American Studies 200 nor the second seminar count towards the eleven-course concentration requirement described above. However, students who complete more than these two required seminars may count such additional seminars towards their eleven-course concentration requirement. Most courses that fulfill the second seminar requirement are so noted in the updated list available at the program office. There may be other courses that fulfill this requirement; students should consult the chair or one of the program coordinators in such cases. Seminars taken under the aegis of the Stanford-in-Washington program may also fulfill the second seminar requirement.

Race and Ethnicity Component—Students must take at least two courses in the area of race and ethnicity. One of these two courses may count either towards the eleven-course concentration requirement or, if appropriate, as the second seminar. A list of courses satisfying this requirement may be obtained from the program office.

Optional Specialization in Race and Ethnicity—Students who take at least five approved race and ethnicity courses graduate with an American Studies specialization in race and ethnicity. This is noted on the final undergraduate transcript.

MINORS

Students wishing to earn an undergraduate minor in American Studies must complete seven courses for a minimum of 27 units. All students take the program's core course, American Studies 150/English 121, American Literature and Culture to 1855 (5 units), as an introduction to the critical study of American literature and culture. Students also complete two of the following four courses in American history (10 units) to provide a historical foundation:

- History 165A. Colonial and Revolutionary America
- History 165B. 19th-Century America
- History 165C. The United States in the 20th Century
- History 172A. America since 1945

Additionally, students choose four elective courses appropriate to their particular interests from courses listed under American Studies (12-20 units). These courses should be selected with one of two goals in mind: to give the student a breadth of exposure to various issues in American Studies; and to give the student an opportunity to study an area of American Studies in depth (for example, arts and letters, history, social institutions, policy) or to focus on a particular issue in American Studies (for example, technology in America, race and ethnicity in America, American art and material culture).
All courses counted toward the minor in American Studies must be taken for a letter grade. No course which counts toward the minor can also count toward a student's major.

HONORS PROGRAM

Preferably during the junior year and no later than the third quarter before graduation, majors with demonstrated interest and ability in American Studies may apply to seek honors by writing a senior thesis for 10 to 15 units of credit. This application is to include the topic and a proposed outline of the senior thesis and should be signed by a Stanford faculty member who is willing to direct the student's thesis during the ensuing year. The program may approve the application or request resubmission with revisions. The finished essay must be submitted three weeks before the date of graduation. Units for the honors project must be in addition to the 60-unit major.

COURSES

See departmental listings for complete descriptions and University General Education Requirements (GER) notations. Some courses may require prerequisites that do not apply toward the major. See the Time Schedule each quarter for changes in listings. An up-to-date list is available in the program office.

AMERICAN STUDIES

150. American Literature and Culture to 1855—(Same as English 121.) Required for American Studies major. Reading texts from Cotton Mather to Melville, students examine the major issues in early American cultural and literary history. Developments in the fine and domestic arts, and methodological issues associated with the enterprise called "American Studies." (Literature and Thought) GER:3a (DR:7)
5 units, Win (Fliegelman)

151. The Transformation of American Thought and Culture, 1865 to the Present—Persistent strains and tensions in American intellectual life and culture over the past 125 years. Readings include autobiographies, novels, documentary works, and historical and theoretical analyses that bear on issues of technology and culture, consumerism, mass society, gender, sexuality, violence, political extremism, and power. (History and Society, or Literature and Thought) GER:3a (DR:7 or 8)
5 units, Win (Gillam)

152. American Spaces: An Introduction to Material Culture and the Built Environment—(Same as History 152.) American history through the evidence of things, e.g., spaces, buildings, and landscapes of the "built environment." How to "read" such artifacts using methods and theories from anthropology, cultural geography, history, and other disciplines. (Visual and Material Culture) GER:3b (DR:9)
5 units (Corn) given 2001-02

179. Introduction to American Law—(Same as Law 106, Political Science 182F.) American law for undergraduates. The structure of the American legal system, including the courts; American legal culture; the legal profession and its social role; the scope and reach of the legal system; the background and impact of legal regulation; the relationship between the American legal system and American society in general. (History and Society; or Politics, Policy, and Economics) GER:3b (DR:9)
5 units, Aut (Friedman)

RACE AND ETHNICITY

Two approved race and ethnicity courses are required of all majors. (For details, see previous description of "Undergraduate Programs.") Approved courses include, but are not limited to those offered through the Program in Comparative Studies in Race and Ethnicity. For example, see History 65.
75. The United States and East Asia
115. Technology and Culture in 19th-Century America
150A. African-American History to the 20th Century
159. Introduction to Asian American History

165A. Colonial and Revolutionary America—Required for American Studies major.
165B. 19th-Century America—Required for American Studies major.
165C. The United States in the 20th Century
172A. The United States since 1945
173C. Introduction to Feminist Studies
250B. Undergraduate Colloquium: Constitutional Interpretation in History and Theory
252. Undergraduate Colloquium: Decision-Making in International Crises—The A-Bomb, the Korean War, and the Cuban Missile Crisis
255A. Undergraduate Colloquium: Culture and Ideologies of Race
265. Undergraduate Colloquium: New Research in Asian American History
265A. Undergraduate Colloquium: The History of Sexuality in the United States
274A. Undergraduate Colloquium: Body Works—Medicine, Technology, and the Body in late 20th-Century America
281A. Undergraduate Colloquium: Environmental History of the Americas

PSYCHOLOGY
174. African American Psychology

SOCIOLOGY
25N. Stanford Introductory Seminar: Understanding the Sixties
27N. Stanford Introductory Seminar: Cultural Patterns in Contemporary Society
138/238. American Indians in Comparative Historical Perspective
139/239. American Indians in Contemporary Society
149. The Urban Underclass
150. The Family

SCIENCE, TECHNOLOGY, AND SOCIETY
101. Science, Technology, and Contemporary Society

LITERATURE AND THOUGHT
114. Visions of the 1960s—See description under "History and Society."
150. American Literature and Culture to 1855—(Same as English 121.) See “Core Lectures.”
151. The Transformation of American Thought and Culture, 1865 to the Present—See “Core Lectures.”
214. The American 1960s: Thought, Protest, and Culture

AFRICAN AND AFRICAN AMERICAN STUDIES
105. Introduction to African and African American Studies

COMPARATIVE LITERATURE
24Q. Stanford Introductory Seminar: Ethnicity and Literature—Preference to sophomores.

168. Introduction to Asian American Culture

202. Comparative Ethnic Autobiography

DRAMA
65. American Musical Theater: Broadway/Hollywood

156. Social Dances of North America III
163. Performance and America
179. Teatro America Workshop: The Theater of Native/Chicano America

180Q. Stanford Introductory Seminar: Noam Chomsky—The Drama of Resistance

ENGLISH
104C. Language and Gender in Contemporary American Fiction
105. The Language of Short Stories

112. Masterpieces of American Literature
123D. The Multicultural Moment: American Literature from the Civil War to World War I

125B. American Modernism
125C. American Fiction Between the Wars
127. American Autobiography

161A. African-American Writing, 1950-1970
162H. Literature of the African Diaspora
167A. Americans in Paris

168. American Indian Mythology, Legend, and Lore
168B. Introduction to African-American Literature

179E. Hemingway and Fitzgerald
179H. Mark Twain and the Gilded Age

186B. Seminar: Melville
186J. Seminar: American Thought and Literature—Jefferson to the Jameses

186K. Seminar: The Social Novel in America
187B. Seminar: Central Issues in African-American Intellectual History

187D. Seminar: Modern British and American Poetry
187M. Seminar: The American Long Poem

Chair: William H. Durham
Consulting Assistant Professor: Nina Jablonski
Consulting Assistant Professor: Dominique Irvine
Visiting Associate Professor: Lawrence A. Hirschfeld
Affiliated Faculty: Carol Boggs, L. Luca Cavalli-Sforza, David Cox, Marcus W. Feldman, Henry Greely, Barbara Koenig, Ellen Porzig, Armin Rosencranz, Robert Sapolsky, Richard White
Fellows: Alec Knight, Flora Lu, Amanda Stronza

The Department of Anthropological Sciences (ANSI) takes as its subject matter the nature and evolution of our species. The department offers students training in archaeology, cultural anthropology, demography, ecology, environmental anthropology, evolutionary theory, genetics, linguistic anthropology, medical anthropology, paleoanthropology, and primatology. Specialties and interests of individual faculty members include applied anthropology, curing systems in western and non-western societies, ethics, gender, genetic and cultural evolution, historical linguistics and linguistic anthropology, human environments and adaptations, human origins, hunters and gatherers, materialism, molecular anthropology, social and psychological anthropology, and tools and technology. The department is united by a common interest in the interrelations of biology, culture, and environment, and by a commitment to a four-field, scientific approach to anthropology.

The departmental curriculum includes courses at three levels. These courses are designed to: (1) expose undergraduates to the theories, methods, and substance of the anthropological sciences; (2) provide undergraduate majors and minors with a program of work leading to the bachelor’s degree; and (3) prepare candidates for advanced degrees in the discipline. Students are also encouraged to pursue ethnographic area studies building on existing faculty research in Asia, Latin America, and North America.

The department offers an undergraduate Bachelor of Arts degree. Undergraduates may elect to specialize in any one of four concentration tracks: (1) Culture, Social Relations, and Language; (2) Archaeology and Evolutionary Studies; (3) Population and Environment; and (4) Medical Anthropology and Genetics. Within each of these concentration tracks, students work with their faculty adviser to design a course of study that includes at least one course from each of five areas of the “Human Evolution Framework” (described below): human nature and variation, human history and prehistory, human evolutionary processes and their interactions, cultural systems and cultural transmission, and laboratory and field methods. The framework is designed to ensure that students of all specializations receive a solid grounding in evolutionary thinking and analysis.

The department offers three graduate degrees: Master of Science, Master of Arts, and Doctor of Philosophy. The graduate curriculum encourages students to pursue individual interests and projects under the supervision of a faculty committee. The backbone of the graduate program is a department-wide Core Seminar devoted to ongoing discussion of issues and approaches in the anthropological sciences. An active Teaching Assistant training program, focused on students in the second year of the Ph.D. program, is an integral part of graduate training. The graduate program offers students a wide range of opportunities for training in theoretical and practical skills, including model-building, ethnographic methods, archaeological and osteological techniques, data analysis, computer imaging, laboratory methods in genetics, and a variety of field training options. At both the undergraduate and graduate levels, the curriculum emphasizes the use of scientific methodology.

The department also offers a variety of hands-on research and training opportunities, including research assistantships, internships on- and off-campus, an active undergraduate Honors program, and a series of field seminars with scholarships in the Amazon, the Andes, the American Southwest, Middle America, and Galapagos. Undergraduate and graduate students are encouraged to work with various faculty at their field sites each summer. The department maintains teaching and research collections in the Iris and B. Gerald Cantor Center for Visual Arts at Stanford University, featuring materials from the Americas, the Pacific Rim, and Africa. Under the “Pritzker Summer Scholars” program, the
department also awards a number of summer grants each year to undergraduates who are planning specialized study in Anthropological Sciences. The grants are of three kinds: (1) Training Grants, to help with the costs of summer field schools and training programs (applications in Spring Quarter); (2) Mentored Research Grants, to enable students to gain research experience by working on faculty research projects (application in Spring Quarter); and (3) Independent Research Grants, to facilitate summer research projects leading to Honors in Anthropological Sciences (application in Winter Quarter). In addition, students have the opportunity to participate in ongoing historical archaeology conducted on campus.

Note—The degree programs in the Department of Anthropological Sciences became available in the Autumn Quarter of 1999-2000. Current students who enrolled in 1998-99 or in any previous year have the option of finishing their degrees under the guidelines and requirements of the former Department of Anthropology (see, for example, Stanford Bulletin 1998-99), or they may opt for the new guidelines and requirements outlined here. The choice of these options should be made in writing, with the faculty adviser’s approval, and filed with the Student Services Coordinator in the Anthropological Sciences office.

UNDERGRADUATE PROGRAMS

The Department of Anthropological Sciences offers a Bachelor of Arts degree together with an Honors program and a minor. The Anthropological Sciences programs include active undergraduate advising (described below).

BACHELOR OF ARTS

The A.B. degree program in Anthropological Sciences gives students an understanding of the breadth and depth of anthropological knowledge, as well as a series of intellectual and practical tools. Majors choose from one of four concentration tracks: Language, Culture, and Social Relations; Archaeology and Evolutionary Studies; Population and Environment; and Medical Anthropology and Genetics. The A.B. in Anthropological Sciences provides solid preparation for careers in anthropology, business, economic development, education, foreign service, health professions, international relations, law, or public policy.

With the addition of courses from the natural, physical, and mathematical sciences, the A.B. degree also provides preparation for further study in a broad variety of scientific areas, including earth sciences, ecology and evolutionary biology, environmental sciences, human genetics, medicine, and psychology. The department is developing a Bachelor of Science degree; and provides guidance for undergraduate students who want to ensure a strong background in the natural and quantitative sciences as they earn an undergraduate Anthropological Sciences degree (see the Student Services Coordinator for details).

REQUIREMENTS

The department offers considerable flexibility in structuring an Anthropological Sciences major. In consultation with a faculty adviser, students develop a program that reflects their individual interests and needs. Majors in anthropological sciences meet with their advisers at least once every quarter. Each student’s progress toward fulfilling the major requirements is recorded in a departmental file. It is the student’s responsibility to see that this file is kept up to date.

All A.B. majors in the Department of Anthropological Sciences (ANSI) must fulfill the following requirements:

1. Course work equivalent to 65 units, with at least 45 units in Anthropological Sciences. The remaining 20 units may be taken in any of the related humanities, social science, and science departments and programs, including the Department of Cultural and Social Anthropology. Outside courses must form a coherent program of study and must be approved by the student’s adviser. Up to 10 of the 65 units may be in Directed Individual Study.

2. Complete ANSI 2A and 2B (Human Biology 2A and 2B), or three other “Introductory Courses” as listed below.

3. Complete at least one course in each of the four traditional subfields of anthropology: archeological, biological anthropology, linguistic, and sociocultural.

4. A letter grade of ‘B’ or better in the theory course, History of Theory in Anthropological Sciences (ANSI 190). This course fulfills the University’s Writing in the Major Requirement (WIM) and should be taken no later than the junior year.

5. Declare a concentration track and complete at least 25 units in that track.

6. Complete at least one course from each of the five Human Evolution Framework (HEF) areas below, including lab and field methods. Note that some courses satisfy multiple areas of the HEF.

7. Complete at least one foreign language course at the second-year level with a letter grade of ‘B’ or better. This requirement may also be met by special examination, presentation of superior foreign language placement scores, or certification in writing from an appropriate department.

8. Complete at least one course in statistics (ANSI 192, Biological Sciences 141, Psychology 60, Statistics 60, or equivalent).

CONCENTRATION TRACKS

Concentration tracks are designed to encourage students to acquire in-depth knowledge and training. Undergraduates in the major program may elect to specialize in one of the four tracks described below. Alternatively, students may design their own specialization(s) with the guidance of a faculty adviser. Each student is required to complete 25 units within the chosen track. With consent of their faculty adviser, students may replace one course with a relevant course offered by another department. The 25 units count towards the total of 65 units required for the major.

Culture, Social Relations, and Language (Track 1)—Emphasizes the unity and diversity of contemporary social, cultural, and linguistic systems. Course offerings include culture and social theory, family, gender, kinship, linguistic anthropology, and political economy. Ethnographic area studies are strongly encouraged for students who choose this track.

Archaeology and Evolutionary Studies (Track 2)—Features primate evolution, human origins and prehistory, and the development of human societies from early hunter-gatherers through complex civilizations. Students choose from courses in anthropological genetics, archaeology, evolutionary theory, historical linguistics, paleoanthropology, and primatology.

Population and Environment (Track 3)—Explores mutual relationships between human populations and their environments. Biocultural adaptations of human societies to diverse environments are examined, as are the causes and consequences of human impact upon local and global environments. Students choose from courses in behavioral ecology, demography, ecological and environmental anthropology, and selected area studies.

Medical Anthropology and Genetics (Track 4)—Examines human biological and cultural variation from a variety of perspectives. Within medical anthropology, the focus is on the social, cultural, and genetic correlates of physical and mental health, as well as disease. In anthropological genetics, students explore the extent, origins, and impact of variation among human genomes. Students choose from courses in epigenetics, genetics, and medical anthropology.

HUMAN EVOLUTION FRAMEWORK (HEF)

Crossing-cutting these concentration tracks is an evolutionary framework designed to familiarize students with the tools of analysis in anthropological sciences. The department divides this framework into five essential components (HEF I-V) as outlined below. Regardless of the concentration track, students are required to take at least one course in each of these component areas. Many courses offered by the department satisfy one or more of these requirements as shown by the HEF designations under “Courses” below.

Human Nature and Variation: Past and Present (HEF I)—Biological nature and variation
Cultural nature and variation
Language capability and linguistic variation
Human universals, human differences

*Human History and Prehistory: Inferring Events of the Past* (HEF II)
- Population events: movements, splits, admixture, extinctions
- Environmental events: changes in climate, resources, disease
- Species events: adaptation, speciation, species extinction
- Social and cultural events: changes in technology, settlement, language, and social organization

*Evolutionary Processes and their Interactions* (HEF III)
- Molecular evolution, population genetics, and speciation
- Cultural and linguistic evolution, ethnohistory, social evolution
- Causes and consequences of environmental change
- Interactions of genetic, cultural, and social evolution

*Cultural Systems and Cultural Transmission* (HEF IV)
- Systemic properties of culture and language
- Transmission of culture in space and time
- Cultural ontogeny and socialization
- Relationship between individual, society, and culture

*Labor and Field Methods: Tools for the Anthropological Sciences* (HEF V)
- Laboratory and field methods
- Ethnographic methods
- Data analysis
- Computational models and methods

### Declaring a Major
To declare an Anthropological Sciences major, students should first discuss their ideas and plans with one or more department faculty, and with at least one peer adviser. When they have a good working plan on paper (forms are available from the Student Affairs Coordinator) for their course of study, they must then fill out the Declaration of Major form in the Registrar's Office, obtain the signature of their student and faculty advisers, and contact the department's Student Services Coordinator who will review the degree requirements and give general guidance. It may be helpful for students to meet with the chair of the department's Student Affairs Committee for initial academic advising and assistance in choosing an appropriate adviser in the department. Students must complete the declaration process (including the signature of their Anthropological Sciences adviser) no later than the last day of the quarter, two quarters prior to degree conferment (Autumn Quarter if Spring graduation is planned).

Undergraduates are actively encouraged to take advantage of funding opportunities to carry out independent research. Funding for undergraduate research is available from Undergraduate Research Opportunities (URO) grants, affiliated area studies programs (for example, Latin American Studies), and the department's own Pritzker Summer Scholars Program described above. Information and applications for the latter are available from the Academic and Student Services Coordinator in the department office.

### Advising Program
The department puts high priority on undergraduate advising. Each student works with one or more peer advisers, as well as a faculty adviser, to design and carry out their Anthropological Sciences major or minor. The advising program is built on a faculty mentoring approach, and to help students develop a good working relationship with at least one faculty member. Students are expected to meet regularly, and for at least two hours per quarter, with their faculty adviser to discuss their progress and to review course selection, research opportunities, graduate or professional schools, and career planning. Peer advisers are the first step in seeking advice; they keep regular hours in the peer advising office in the department.

### MINORS

*Declaring a Minor*—The department offers flexibility in structuring an Anthropological Sciences minor. In consultation with both peer and faculty advisers, students develop a minor that reflects their individual interests and needs. Prospective Anthropological Sciences minors should request an Anthropological Sciences Minor Planning Form and Checklist from the department's Academic and Student Services Coordinator. All minors in the Department of Anthropological Sciences must fulfill the following four requirements:

1. Selection of an Anthropological Sciences faculty adviser and approval of the minor courses by both peer and faculty advisers.
2. Completion of 30 units of course work in Anthropological Sciences with a grade point average (GPA) of 'B+' or better. With the adviser's approval, up to 15 units of required 30 units may be taken in Cultural and Social Anthropology or other social science departments at Stanford. No more than 10 of the 30 units may be taken for an instructor-elected Satisfactory/No Credit grade. Student-elected Satisfactory/No Credit units are not allowed.
3. Completion of ANS12A and 2B (Human Biology 2A and 2B) or three courses from introductory offerings.
4. Completion of at least one course at the 100 level or higher. Note: Human Biology majors who minor in ANSI cannot double count Human Biology 2A and 2B, and must then take 30 units of ANSI course work other than 2A and 2B.

### HONORS
The Honors Program in Anthropological Sciences provides students the opportunity to conduct original research under the guidance of a faculty adviser. Candidates of sophomore and junior standing should submit an application to the student program coordinator no later than the end of the fourth week of the Spring Quarter. It must include a brief statement of a proposed honors project, a complete course of study within Anthropological Sciences, a transcript, and written approval of a faculty sponsor. The Student Affairs Committee reviews applications and notifies accepted students.

Candidates whose application to the honors program has been approved by the Student Affairs Committee must complete all of the requirements for their major and submit an honors thesis no later than three weeks prior to the end of the quarter in which graduation is anticipated. The thesis is read by the candidate's adviser and a second reader.

Students interested in honors are especially encouraged to apply for summer research funding through the department, through the office of Undergraduate Research Opportunities (URO), and through the various area studies centers on campus (for example, African and African American Studies, Latin American Studies, and so on). In most cases, honors students apply for such funding no later than Spring Quarter of their junior year.

### COTERMINAL DEGREES
The Department of Anthropological Sciences accepts applications from Stanford undergraduates to work toward coterminal A.M. or M.S. degrees. Undergraduate students with a grade point average (GPA) of 3.0 or higher may apply between their seventh and eleventh years at Stanford. No more than 10 of the 30 units may be taken for an instructor-elected Satisfactory/No Credit grade. Student-elected Satisfactory/No Credit units are not allowed.

### GRADUATE PROGRAMS
University requirements for the degrees of Master of Arts, Master of Science, and Doctor of Philosophy are described in the “Graduate Degrees” section of this bulletin.

The department offers three graduate degrees: Master of Science, Master of Arts, and Doctor of Philosophy. The graduate curriculum encourages students to pursue individual interests and projects under the supervision of a faculty committee. Specific details of the graduate programs in Anthropological Sciences are outlined in the departmental Graduate Handbooks (available in the department office).

### MASTER OF ARTS
The Department of Anthropological Sciences offers the A.M. degree to four groups of students: Stanford undergraduates who enroll in the
DOCTOR OF PHILOSOPHY

Prospective graduate students should request application materials from Graduate Admissions in the Registrar’s Office. The deadline for applications is January 1. The Graduate Record Exam (GRE) is required. Successful applicants for the Ph.D. program may enter only in Autumn Quarter.

REQUIREMENTS

Requirements 1-9 must be completed within the first two years:

1. Within the first two years, complete 67 units of course work for a letter grade, while maintaining a grade point average (GPA) of 'B+' or better. Of these 67 units, at least 40 units must come from graduate-level courses within the department. The remaining 27 units may include advanced undergraduate courses as well as courses from related humanities, social science, and science departments and programs, including the Department of Cultural and Social Anthropology. Outside courses must form a coherent program of study and be approved by the student’s adviser.

2. Enroll in the departmental Core Seminar (ANSI 290) each quarter while in residence. First year students are expected to enroll in the Core Seminar for a minimum of 3 units per term.

3. Complete Data Analysis in the Anthropological Sciences (ANSI 292), both for a letter grade. Units earned in this course count toward the 45-unit A.M. requirement.

4. Enroll in the departmental Core Seminar (ANSI 290) each quarter while in residence. First year students are expected to enroll in the Core Seminar for a minimum of 3 units per term.

5. Complete Data Analysis in the Anthropological Sciences (ANSI 292) for a letter grade. Units earned in this course count toward the 45-unit M.S. requirement.

6. Students must submit a professional-quality field or library research paper to be read and approved by at least two department faculty members.

7. For those whose native language is English, pass an examination in a language other than English that will either serve as a field or research requirement. Of these 67 units, at least 40 units must come from graduate-level courses within the department. The remaining 27 units may include advanced undergraduate courses as well as courses from related humanities, social science, and science departments and programs, including the Department of Cultural and Social Anthropology. Outside courses must form a coherent program of study and be approved by the student’s adviser.

8. Serve as a teaching assistant for three undergraduate courses. In preparation for this responsibility, students are expected to take part in the departmental Teaching Assistant Training Program organized each year. (Students can petition to substitute an internship or research assistantship for one quarter as a TA.)

9. Petition for and advance to candidacy by the end of the second year. After successful completion of the first two years of the program, and after an accepted petition for doctoral candidacy, advanced graduate students are required to complete the following:

   1. Pass a special examination (written and oral). This examination fulfills the requirement of the University oral examination and may be scheduled at any time during the third year that is directly following admission to candidacy.

   2. Submit the Doctoral Dissertation Reading Committee form before approval of TGR status or before scheduling a University oral examination that is in defense of a dissertation. The reading committee is to be recruited no later than the end of the third year.

   3. Take at least one quarter of Proposal Writing (ANSI 294) and prepare a dissertation proposal to be approved by the dissertation reading committee before the end of the Spring Quarter of the third year. If necessary, obtain Human Subjects clearance.

   4. Take at least one quarter of Dissertation Writing (ANSI 298) and complete an approved dissertation based on independent research.

   5. Give a public presentation of the dissertation in the department.

COTERMINAL PROGRAM

Stanford graduate students taking advanced degrees in other departments or schools at Stanford; Ph.D. students in Anthropological Sciences who fulfill the A.M. requirements in the course of their work toward the Ph.D. degree, and students who apply from outside of Stanford for entry into the terminal A.M. program.

REQUIREMENTS

1. Graduate enrollment at Stanford for at least three quarters of full tuition.

2. At least 45 units of course work for a letter grade (in addition to any pertinent undergraduate courses), with at least 30 units in Anthropological Sciences. The remaining 15 units may be taken from related humanities, social science, and science departments and programs, including the Department of Cultural and Social Anthropology. Outside courses must be approved by the student’s adviser and must form a coherent program of study. No more than 10 of the 45 units may be in Directed Individual Study. Students must maintain a grade point average (GPA) of 'B' or better.

3. At least four graduate-level courses, other than “Special Courses,” in Anthropological Sciences, all for a letter grade. The remaining units may be made up of courses selected in consultation with the student's faculty adviser.

4. Enroll in the departmental Core Seminar (ANSI 290) each quarter while in residence. First year students are expected to enroll in the Core Seminar for a minimum of 3 units per term.

5. Complete Data Analysis in the Anthropological Sciences (ANSI 292) for a letter grade. Units earned in this course count toward the 45-unit A.M. requirement.

6. Students must submit a professional-quality field or library research paper to be read and approved by at least two department faculty members.

MAJOR OF SCIENCE

The Department of Anthropological Sciences offers the M.S. degree to four groups of students: Stanford undergraduate science majors who enroll in the coterminal program; Stanford graduate students taking advanced degrees in other departments or schools at Stanford; Ph.D. students in Anthropological Sciences who fulfill the M.S. requirements in the course of their work toward the Ph.D. degree, and students who apply from outside of Stanford for entry into the terminal M.S. program. Students applying to the M.S. program must have a B.S. degree.

REQUIREMENTS

1. Graduate enrollment at Stanford for at least three quarters of full tuition.

2. At least 45 units of course work for a letter grade (in addition to any pertinent undergraduate courses), with at least 30 units in Anthropological Sciences. The remaining 15 units may be taken from related humanities, social science, and science departments and programs, including the Department of Cultural and Social Anthropology. Outside courses must be approved by the student’s adviser and must form a coherent program of study. No more than 10 of the 45 units may be in Directed Individual Study. Students must maintain a grade point average (GPA) of 'B' or better.

3. At least four graduate-level courses, other than “Special Courses,” in Anthropological Sciences, all for a letter grade. The remaining units may be made up of courses selected in consultation with the student’s faculty adviser.

4. Enroll in the departmental Core Seminar (ANSI 290) each quarter while in residence. First year students are expected to enroll in the Core Seminar for a minimum of 3 units per term.

5. Complete Data Analysis in the Anthropological Sciences (ANSI 292) for a letter grade. Units earned in this course count toward the 45-unit M.S. requirement.

6. Students must submit a professional-quality field or library research paper to be read and approved by at least two department faculty members.

7. For those whose native language is English, pass an examination in a language other than English that will either serve as a field or research requirement. Of these 67 units, at least 40 units must come from graduate-level courses within the department. The remaining 27 units may include advanced undergraduate courses as well as courses from related humanities, social science, and science departments and programs, including the Department of Cultural and Social Anthropology. Outside courses must form a coherent program of study and be approved by the student’s adviser.

8. Serve as a teaching assistant for three undergraduate courses. In preparation for this responsibility, students are expected to take part in the departmental Teaching Assistant Training Program organized each year. (Students can petition to substitute an internship or research assistantship for one quarter as a TA.)

9. Petition for and advance to candidacy by the end of the second year. After successful completion of the first two years of the program, and after an accepted petition for doctoral candidacy, advanced graduate students are required to complete the following:

   1. Pass a special examination (written and oral). This examination fulfills the requirement of the University oral examination and may be scheduled at any time during the third year that is directly following admission to candidacy.

   2. Submit the Doctoral Dissertation Reading Committee form before approval of TGR status or before scheduling a University oral examination that is in defense of a dissertation. The reading committee is to be recruited no later than the end of the third year.

   3. Take at least one quarter of Proposal Writing (ANSI 294) and prepare a dissertation proposal to be approved by the dissertation reading committee before the end of the Spring Quarter of the third year. If necessary, obtain Human Subjects clearance.

   4. Take at least one quarter of Dissertation Writing (ANSI 298) and complete an approved dissertation based on independent research.

   5. Give a public presentation of the dissertation in the department.
Financial Support—The department endeavors to provide needed financial support (through fellowships, teaching and research assistantships, and tuition grants) to all students admitted to the Ph.D. program who maintain satisfactory progress. First-year students in the Ph.D. program who have not entered with outside funding are required to apply for such funding during their first quarter. See Guide to the Ph.D. Program in Anthropological Sciences and the department website (http://www.stanford.edu/dept/anthsci) for details.

Ph.D. MINOR

The requirements for a Ph.D. minor in Anthropological Sciences are the following:

1. Enlist a faculty member of Department of Anthropological Sciences who will consent to serve as the adviser for the minor.
2. Submit an application for admission to the Ph.D. minor to the Department of Anthropological Sciences. The completed application must include the written consent of the adviser. The application and any associated instructions should be obtained from the department’s Student Program Coordinator.
3. Complete 27 units of courses in the Department of Anthropological Sciences at Stanford for letter grades in courses for which letter grades are offered, with a grade average of ‘B’ or better. The University Ph.D. minor requirements state that 20 of these units must be in courses numbered 200 or above, and that course work for the minor cannot also be used to meet the requirements for a master’s degree. Of the additional 7 units, 2 are to be taken in conjunction with the department’s Core Seminar (ANSI 290*) and the additional 5 units are not restricted as to course number.
4. In conjunction with the adviser, determine a coherent course of study related to the student’s interests. Among the 27 units of required Anthropological Sciences courses, the student must take either ANSI 190, 201 A, or 201 B, and must enroll in the department’s Core Seminar (ANSI 290) for at least two quarters, at a minimum of 1 unit per quarter. No more than 10 of the 27 units can be Individual Study or Independent Research. No more than 15 of the 27 units can be counted from courses taken before submission of the application for admission to the Ph.D. minor, and these 15 or fewer only with the approval of the adviser.
5. It is expected that the student’s adviser will participate as a representative of the department at the student’s University Ph.D. oral examination. The student is responsible for this arrangement with the major department.
6. For graduation, complete all necessary paperwork with the department’s student program coordinator.

* The required Core Seminar (ANSI 290) is given for credit only.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

Undergraduate Anthropological Sciences courses 130 and above are organized by concentration tracks, 1 to 4 (see above). (HEF) designations indicate the given course satisfies requirement I, II, III, IV, or V of the Human Evolution Framework, also described above. A course may satisfy more than one HEF requirement.

NUMBERING SYSTEM

Anthropological Sciences courses are numbered according to the following scheme:

01-99 Introductory Courses
01-19 General Introductory Courses
20-29 SIS Courses (freshmen preference)
30-39 SIS Seminars and Dialogues (sophomore preference)
100-129 Culture, Social Relations, and Language
100-109 Culture and Social Relations
110-119 Language
120-124 Area Studies: The Americas
125-129 Area Studies: Asia
130-149 Archeology and Evolutionary Studies
130-139 Evolutionary Studies
140-149 Archeology
150-169 Population and Environment
150-159 Population/Demography
160-169 Environment/Ecology
170-189 Medical Anthropology and Genetics
170-179 Medical Anthropology
180-189 Anthropological Genetics
190-199 Special Courses
200-299 Graduate-level Courses

INTRODUCTORY

Intended to serve as an introduction to the methods, theories, and substance of Anthropological Sciences, introductory courses are for both majors and non-majors. ANSI 2A and 2B (Human Biology 2A and 2B) provide a good introduction to the major; alternatively, a student may take three other Introductory Courses numbered from 3 to 40.

2A. Genetics, Evolution, and Ecology—(Enroll in Human Biology 2A.)
5 units, Aut (Boggs)

2B. Culture, Evolution, and Society—(Enroll in Human Biology 2B.)
5 units, Aut (Klein)

3. Introduction to Prehistoric Archaeology—Aims, methods, and data in the study of human society’s development from early hunters through late pre-historic civilizations. Archaeological sites and remains characteristic of the stages of cultural development are examined for selected geographic areas, emphasizing methods of data collection and analysis appropriate to each. GER:3b, 4a (DR:2 or 9)
3-5 units, Aut (Rick)

4. Language and Culture—Language variants (dialects, registers, jargons, writing, and non-verbal systems) and their use. Language classification and human prehistory. Linguistic determinism, relativism, encodability, and the cultural origins of vocabulary and grammar. The structure of discourse, including conversation, narrative, and poetics. Language, gender, and power. Style, strategy, and ideology in language use. Emphasis is on the comparative reading of monographic studies of language and culture in particular societies.
4-5 units (Fox) not given 2000-01

5. The Biology and Evolution of Language—Language as an evolutionary adaptation of humans. Comparison of communicative behavior in humans and animals, and the inference of evolutionary stages. Structure, linguistic functions, and the evolution of the vocal tract, ear, and brain, with associated disorders (stuttering, dyslexia, autism, schizophrenia) and therapies. Controversies over language “centers” in the brain and the innateness of language acquisition. Vision, color terminology, and biological explanation in linguistic theory.
4-5 units (Fox) not given 2000-01

6. Human Origins—The human fossil record from the first non-human primates in the late Cretaceous or early Paleocene, 80-65 million years ago, to the anatomically modern people in the late Pleistocene, between 100,000 to 50,000 B.C. Emphasis is on broad evolutionary trends and on the natural selective forces behind them. GER:2a (DR:5)
5 units, Win (Klein)

7. Marriage and Kinship—Surveys the variation in human kinship systems, asking whether or not they can be understood as evolutionary products, and considers the contribution to be made by a Marxist perspective. Eurasia and Africa are contrasted with Europe and E. Asia. GER:3b, 4c (DR:9)
5 units, Win (Wolf)
5 units, Win (Mountain)

9. Human Environments and Adaptations—The relationship between diverse human populations and their environments. Theories for how environments influence human behavior and culture, and for how human populations shape their environments. Emphasis is on present-day environmental problems and the human dimensions. How the social and cultural processes can cause environmental problems (e.g., deforestation, soil erosion, habitat degradation), and help to solve them.
3-5 units (Staff) not given 2000-01

STANFORD INTRODUCTORY SEMINARS (SIS)
The SIS program within the Department of Anthropological Sciences provides opportunities for first- (N) and second-year (Q) students to work closely with faculty. Units for these courses count towards the Anthropological Sciences major requirements.

20N. Stanford Introductory Seminar: Modern Human Origins—Preference to freshmen. Analysis of the data and theories bearing on the origins of anatomically modern humans between 1,000,000 and 50,000 years ago. Emphasis is on the two major contending theories: that modern humans originated more or less simultaneously from non-modern humans in many regions of Africa and Eurasia; or that modern humans originated exclusively in Africa and spread from there. How paleontologists test these theories against the empirical data of genetics and the fossil record.
3 units, Spr (Klein)

23N. Stanford Introductory Seminar: Maya Mythology Multimedia Project—Preference to freshmen. Lectures, discussions, and hands-on work in the development of a world-wide web project on the mythology of the ancient and modern Maya, emphasizing the relationships between the Quiche mythological text, Popol Vuh, and ancient Maya art and archaeology, hieroglyphic texts, colonial documents, modern ethnography, modern Maya narrative language, and mythological theory. GER:3b (DR:9)
3 units, Win (Fox)

31Q. Stanford Introductory Seminar: Earthquakes and Archaeology in the Eastern Mediterranean—Lectures and Field Trip—(Enroll in Geophysics 50Q.)
3 units, Win (Nur)

CULTURE, SOCIAL RELATIONS, AND LANGUAGE
In addition to the courses listed directly below, ANSI courses 165 and 170, listed in other concentration tracks, also count towards the Track 1 concentration.

CULTURE AND SOCIAL RELATIONS
102. Women, Fertility, and Work—Is gender culturally or biologically determined or both? The arguments for sociobiological and cultural determinist explanations of the differences between women and men are compared, emphasizing their intersection in work. Case studies: gatherer/hunter, horticultural (Melanesian), southern Chinese, and Anglo-American societies. HEF I, IV GER:4c (DR:†)
5 units (Gates) not given 2000-01

103. Theory and Method in Cultural Evolution—(Graduate students register for 203.) The concept of culture as used in anthropology, and the ways in which culture is socially conveyed and manipulated. The capacity for "descent with modification" in cultural systems. Critical examination of transmission forces, direct and indirect bias, epigenetic theory, cultural selection, gene-culture coevolution, and ethnogenesis. HEF III, IV
5 units (Durham) not given 2000-01

104. The Anthropology of Childhood—Children do not think, talk, or act as adults do. Anthropology studies population differences in thought, language, and behavior. The overlooked convergence of these two observations, examining how cultural differences in child rearing and the conceptualization of childhood across time and space affect child development.
5 units, Aut (Hirschfeld)

105. Race, Gender, and Biology—Critically evaluates the biological arguments for the explanation of race and gender inequality in human societies. The history of the issues, examining the arguments of proponents (to the effect that race and sex role differences are rooted in our biology) and the arguments of their critics. Recent arguments, including those of sociobiology and its critics, because of their influence on contemporary social thought. HEF I
5 units (Durham) not given 2000-01

106. Human Origins in Science and Myth—A comparison of peoples' accounts of their own and others origins, with inferences made from comparative biological, linguistic, and cultural data. Functional, psychological, historical, folkloristic, and literary interpretations of myths and other narratives of origin. The scientific account as narrative. The intellectual accomplishments of supposedly primitive and advanced cultures, asking whether their cognitive models of time, space, and the cosmos justify such differentiation. (HEF IV)
5 units (Fox) not given 2000-01

107. Culture and Cognition—(Graduate students register for 207; same as Psychology 278.) Theories of culture make strong claims about how people represent the world to themselves and others, particularly claims about perception, memory, and reasoning. The basic anthropological assumptions about cultural knowledge (e.g., that members of different cultures deploy incommensurate world views) in light of recent advances in cognitive science, and how well characterizations of thinking and reasoning hold up in a cross-cultural perspective. Enrollment limited to 20.
5 units, Aut (Hirschfeld)

108. The Cultural Politics of Race and Ethnicity—Research on race and ethnicity by cultural anthropologists, historians, and historical sociologists is often independent of (and at times in counterpoint to) research on prejudice, stereotyping, and bias in psychology. The development of both lines of research, appraising them with respect to each other and toward a reconciliation of these approaches to a common theme. Enrollment limited to 10.
5 units, Win (Hirschfeld)

LANGUAGE
110. Introduction to Language Change—Variation and change as the natural state of language. Differentiation of dialects and languages over time. Determination and classification of historical relationships among languages, and reconstruction of ancestral stages. Types, rates, and explanations of change. Parallels with cultural and genetic evolutionary theory. Implications for the description and explanation of language in general. (HEF II, III) GER:3b (DR:9)
4-5 units, Win (Fox)
111. Language and Prehistory—Language classification and its implications for human prehistory. The role of linguistic data in analyzing prehistoric populations, cultures, contact, and migrations. Comparison of linguistic and biological classifications. Semantic reconstruction, proto-vocabularies, and culture. Archaeological decipherment, the origins and evolution of writing, and the relationships between writing, culture, and civilization. (HEF II, III)
5 units (Fox) not given 2000-01

112. Human Diversity: A Linguistic Perspective—The diversity and distribution of human language and its implications for the origin and evolution of the human species. The origin of existing languages and the people who speak them. Where did the languages that we currently see in the world come from and how can this diversity be used to study human prehistory? Evidence from related fields (archaeology and human genetics). Topics: the origin of the Indo-European languages, the peopling of the Americas, and the evidence that all human languages share a common origin.
5 units, Spr (Ruhlen)

115. Maya Hieroglyphic Writing—(Graduate students register for 215.) Lecture/workshop on the decipherment of the hieroglyphic writing of the Classic Maya. Principles of archeological decipherment. Analysis of Maya calendrical, astronomical, political, and religious/mythological texts on stone, wood, bone, shell, ceramic vessels, and screenfold books. Ancient Maya scribal practice and literacy. The origins of Maya writing and related Mesoamerican writing systems. The impact of epigraphy on the archeology and linguistics of the Maya.
5 units, Spr (Fox)

119. Linguistic Field Methods—Practical training in the collection and analysis of linguistic data from native speakers. Research goals, ethics, working in the community, technical equipment, and analytical strategies. Emphasis is on the use of computers in the collection, analysis, and preparation of materials useful to the subject community. Prerequisite: introductory linguistics. (HEF V)
5 units (Fox) not given 2000-01

120. Native American Cultures of North America—Introduction to the diverse cultures of indigenous peoples in N. America before the European conquest. Lectures, readings, and films on the precontact situation, postcontact changes (including government policies), influences of Indian culture on American society and culture, and the contemporary situation of native peoples. An antidote to TV and Western movie stereotypes. (HEF IV) GER:4b (DR:3)
5 units (Barnett) not given 2000-01

121. Native Peoples and Cultures of the Southwest—The development of the rich, varied cultures of the American southwest from earliest prehistory to postmodern times. Emphasis is on the interaction of cultures and their responses to changes in social and natural environments. Recommended: background in Native American cultures, literature, and archaeology. (HEF IV)
5 units (Barnett, Rick) not given 2000-01

122. The Maya—Introduction to the archaeology and culture of the ancient and modern Maya. Archaeological and historical data and classification of periods and variation in Maya culture. The natural world of the Maya: environmental, food, agriculture, technology, and medicine. The life cycle and daily life, power and social structure, language and writing, mythology, time, astronomy, religion, and art. The Spanish conquest and the colonial Maya. The Maya in the modern world system. (HEF II, IV)
5 units (Fox) not given 2000-01

123. Environmental Issues in the Americas—Focus is on the local impacts of major environmental problems in the Americas. Case studies: deforestation of tropical rainforest in the Amazon; co-management of marine fauna in the Arctic; forestry management in Mexico and N. America; and pollution, toxic waste, and environmental justice in the U.S. (HEF III)
5 units (Staff) not given 2000-01

124. Perspectives on Sustainable Development in Latin America—(Same as Latin American Studies 195.) Cross-disciplinary examination of perspectives for "sustainable development" in rural areas of Latin America. Interactions between poverty, development, environmental degradation, and approaches to growth and stability in agroecology, agroforestry, small farm development, and conservation biology. Limited enrollment. HEB III
5 units, Win (Rosset)

AREA STUDIES: ASIA

125A. 20th-Century Chinese Societies—Nationalist China, the People's Republic of China, Taiwan, and the loosely-knit networks of the overseas Chinese are examined through the anthropological methods used in exploring complex societies. Emphasis is on political-economic, demographic, social organizational, gender/kinship, ideological, and transformative aspects of Chinese populations after the 1949 revolution. (HEF IV) GER:3b,4a (DR:2 or 9)
5 units, Spr (Gates, Wolf)

125B. Late Imperial China—Chinese civilization in the late imperial era (960-1911) in its spatial, temporal, structural, institutional, and ideational complexity. Thematic foci: frontiers and empire building, the making of Han Chinese and "barbarians," migrations, colonization, urban and rural living, imperial state and local government, commerce and petty capitalism, kinship and family, gender and marriage, food, money, population, and popular religion. (HEF IV) GER:4a (DR:2)
5 units, Aut (Gates, Wolf)

126. Formosa: An Introduction to Taiwanese History, Culture, and Society—Introduces the history, cultures, and society of Taiwan behind and beyond the headlines: the Dutch Period, the Japanese colonial era, the present day. The social scientific, especially anthropological, scholarship done on Taiwan in the past few decades. Topics: migration, trade, colonization, Han Chinese and the Taiwanese aborigines, social movements, nationalism, political culture, family and kinship.
3-5 units, Spr (Chau)

ARCHEOLOGY AND EVOLUTIONARY STUDIES

In addition to the courses listed directly below, ANSI courses 111, 112, 122A, 180, and 181, listed in other concentration tracks, also count towards the Track 2 concentration.

EVOLUTIONARY STUDIES

130. Modern Human Origins—Analysis of the data and theories bearing on the origins of anatomically modern humans between 100,000 and 50,000 years ago. Emphasis is on the two major competing theories: that modern humans originated more or less simultaneously from non-modern humans in many regions of Africa and Eurasia; or that modern humans originated exclusively in Africa and spread from there, largely replacing non-modern humans elsewhere. (HEF I, II)
5 units (Klein) not given 2000-01

131A. Primate Evolution—(Graduate students register for 231A.) The fossil, molecular, and anatomical data on primate origins, from their mammalian ancestors to the origin of the hominids. The adaptive radiations of lemurs, lorises, tarsiers, New World Monkeys, Old World Monkeys, lesser apes, and great apes. The functional anatomy of primates in relation to habitat and social ecology. (HEF II)
5 units, Spr (Jablonski)
131B. Primate Societies—(Graduate students register for 231B.) Introduction to primatology. Survey of the living primates, primate evolution, distribution, and taxonomy. Life history patterns, dominance hierarchies, reproductive strategies, and social structures. Focus is on cultural behaviors, including tool manufacture and use, language and communication, hunting and warfare, and political behavior. Analysis of current conservation issues. (HEF II)
5 units, Win (Maggioncalda)

131C. Evolution of Primate Intelligence—(Graduate students register for 231C.) Upper-level seminar on the evolution of cognitive abilities in primates. Analysis of selective forces increasing intelligence: from ecological factors impacting early primate species to social and cultural factors affecting hominid evolution. Critical evaluation of hypotheses about relationships between brain morphology and intelligence in humans, nonhuman primates, and hominid ancestors. Prerequisite: 131B or consent of instructor. (HEF V)
5 units, Win (Maggioncalda)

132. Hormones and Behavior—Seminar on primate socioendocrinology. The endocrine correlates of behavior and the behavioral correlates of changes in hormone levels. In-depth analysis of pheromones and other socioendocrine signals and their role in suppression of growth, development, and/or reproduction. The relationship between social rank and endocrine physiology. The evolutionary significance of interactions between social behavior and hormones. Prerequisites: 2A, 2B, 102, or Biological Sciences 150. (HEF I)
5 units (Maggioncalda) not given 2000-01

133A. Beginning Osteology—(Graduate students register for 233A; same as Human Biology 180.) Introduction to the study of the human skeletal system. The biology of the bone: growth and development, structure, and function. Identification of the different bones in the human skeletal system. Methods for assessing age, sex, and the biological affinity of bones from archaeological and paleontological contexts. (HEF I, V) GER:2A (DR:5)
5 units, Aut (Maggioncalda)

133B. Advanced Osteology—(Graduate students register for 233B.) Analysis of human bone remains from archaeological and paleontological sites. In-depth analysis of fragmentary skeletal remains from an archaeological site prior to their reburial. Morphometric measurements and observations of various skeletal elements, and assessment of age, sex, and pathological condition of individual specimens. Cultural influences on skeletal variability, and the assessment of prehistoric population dynamics. (HEF II, V)
5 units, Win (Staff)

134. Human Behavioral Biology—(Enroll in Biological Sciences 150/250.)
6 units (Sapolsky) alternate years, given 2001-02

135. Human Nature in Evolutionary Perspective—Examines selected examples of human behavior (incest avoidance, aggression, attachment, color symbolism, interpretation of facial expressions, etc.), considering the extent to which they are products of our evolutionary heritage. Prerequisites: 2A, 2B, upper-division standing. (HEF I)
5 units (Wolf) not given 2000-01

136. The Human Hand: Evolution, Ontogeny, and Influence—(Enroll in Human Biology 101.)
3 units (Porzig) not given 2000-01

137. Darwin, Evolution, and Galapagos—(Same as Human Biology 161.) Seminar on Darwinian theory as applied to the evolution of flora and fauna on the Galapagos Islands. Darwin’s observations in Galapagos, and their role in the formulation of his theory of evolution; recent research in Galapagos and its implications for our understanding of evolution today. The impact of human activity in Galapagos and emerg-
151. Demography in Anthropology—The study of vital rates in human populations and their social and cultural contexts. Population dynamics in small, non-state societies as contrasted with population dynamics in large industrial states. Emphasis is on the cause of high rates of fertility, mortality, and migration. Introduces demographic methods. (HEF II, V)

5 units (Staff) not given 2000-01

153. The Population Question: From Malthus to Rio—The relationship between the vital rates of human populations (fertility, mortality, and migration) and the social and ecological problems of poverty, hunger, and environmental degradation. To what extent is population growth (and attendant vital rates) the cause of these social ills? To what extent is population growth their consequence? What are the main interactions among social, cultural, ecological, and demographic variables? (HEF II)

3-5 units (Durham) not given 2000-01

154. The Limits to Growth—The past, present, and future of human population growth. Critically evaluates estimates of global and regional carrying capacity and their assumptions, including estimates based upon food, water, energy, and security considerations. Issues raised by inequity, over-consumption, and the role of culture in the history of human populations. The major choices humanity faces in the decades ahead. (HEF II)

3-5 units (Durham) not given 2000-01

156. Colloquium on Population Studies—(Enroll in Biological Sciences 146.)

1 unit, Win (Feldman)

4 units (Staff) not given 2000-01

ENVIRONMENT/ECOLOGY

160. Development and Environment—The cultural and environmental impacts of development projects, focusing on the local level impact of government initiatives to encourage economic development. The role of NGOs in negotiating development priorities and environmental protections. (HEF II)

5 units (Staff) not given 2000-01

161A. Conservation and Development Issues in the Amazon—The prospects for achieving the dual goals of biodiversity conservation and community development in Amazonia. Case studies of recent efforts at biodiversity conservation, including national parks, biosphere reserves, pharmaceutical prospecting, ecotourism, extractive reserves, and agroforestry projects. The costs and benefits of conservation. To whom do these costs and benefits accrue? Critically evaluates Integrated Conservation-Development Projects (ICDPs) in the Amazon today. Optional field trip over Spring Break (at added expense, limited capacity) to selected ICDPs in the Peruvian Amazon. (HEF II) GER:3b (DR:9)

5 units, Win (Stronza, Durham)

161B. Human Ecology of the Amazon—Introduces the various ecosystems of the Amazon and their human inhabitants. The biotic and abiotic factors shaping human adaptation to the region. Ethnographic literature is used to explore subsistence patterns and the resource use of Native Amazonians. Current changes in these economies and life-ways due to acculturation and market forces, and the implications for conservation. (HEF IV)

5 units (Lu) not given 2000-01

162. Indigenous Peoples and Environmental Problems—The social and cultural consequences of contemporary environmental problems. The impact of market economies, “development” efforts, and conservation projects on indigenous peoples, emphasizing the Amazon, E. Africa, and Central America. The role of indigenous grass roots organizations in combating environmental destruction and degradation of homeland areas. (HEF II, IV)

3-5 units (Durham) not given 2000-01

163. Community-Based Conservation—Community-based participatory models for conservation that represent alternatives to conventional top-down approaches. Case studies: pollution control in the U.S., wildlife conservation in Africa, and protection of tropical rainforests in Latin America. The strengths and weaknesses of alternative approaches to conservation, and the potential for community-based models to make a difference. (HEF II)

5 units (Staff) not given 2000-01

164. Ecological Anthropology—(Same as Human Biology 134.) The relationships between human social systems and their environments. How do environments influence the nature and form of human social systems found within them? How do human social systems influence the properties and dynamics of their environments? How can we best conceptualize and understand human social systems, environment, and the links between them? Case studies of human societies in the Arctic, Amazon, E. Africa, the Alps, and Papua New Guinea. (HEF III)

5 units (Durham) not given 2000-01

5 units, Spr (Rosenkrantz)

166A. Indigenous Forest Management—(Enroll in Human Biology 172.) (HEF IV)

5 units, Aut (Irvine)

166B. Fishing for Solutions: Issues in Marine Conservation—(Graduate students register for 266B.) The stories behind communities and their fisheries relate to a resource we cannot see. The history of exploitation of cod, salmon, tuna, and grouper are instructive of the wider challenges facing marine resource management. The complex of cultural, biological, and economic facets that shape a fishery.

3-5 units, Win (Noye)

167. Anthropology of Tourism and Ecotourism—(Enroll in Human Biology 188.)

5 units, Aut (Stronza)

168A. Ecology and Equity—Comparative, cross-cultural perspective on the global environmental debate. The origins, articulations, and resolutions of environmental conflicts, drawing on cases and movements from a variety of societies. Strategies and limits of deep ecology, ecofeminism, alternative technology, Gandhiism, and other approaches. (HEF II)

5 units, not given 2000-01

168B. Environmental Justice—The social movement uniting environmentalism and social justice into one framework. People of color, and people who are socially, economically, and politically disenfranchised often bear the burden of environmental problems. Examples from the U.S., S. America, and Africa are used to examine hazardous waste landfills, petroleum exploitation, and exposure to pesticides and toxic
chemicals in the workplace. The history of environmental justice movement, evidence for its claims, and its challenges and contributions.  
5 units, Aut (Lu)

**MEDICAL ANTHROPOLOGY AND GENETICS**

In addition to the courses listed directly below, ANSI courses 133B and 151, listed in other concentration tracks, also count towards the Track 4 concentration.

**MEDICAL ANTHROPOLOGY**

170. **Medical Anthropology**—(Graduate students register for 270.) For students with interests in health care. Introduction to curing systems in Western and in non-Western cultures; problems of adapting modern medicine to diverse cultures; explication of the social and cultural correlates of physical and mental health and disease (social epidemiology). (HEF IV) GER:3b (DR:9)  
5 units, Aut (Barnett)

171. **Aging: From Biology to Social Policy**—What can we expect when we join the ranks of the elderly? What are the biological processes that contribute to aging and are they the same across all populations and cultures? What are the cultural, social, and economic consequences of a large portion of the elderly? What implications do they have for social policy? Readings, lectures, and films. Students are assisted in research and working with the elderly. (HEF I) GER:3b (DR:9)  
5 units, Spr (Barnett)

172. **Evolutionary Medicine**—(Graduate students register for 272.) Seminar on understanding human health and disease from an evolutionary perspective. Topics: Darwinian medicine, genes and disease, aging, infectious diseases, mental illness, and cancer. Prerequisites: 2A, 2B, upper division standing; or consent of the instructor. (HEF III)  
5 units, Aut (Cronin)

173. **Disease, Health, and Culture Change**—Humans buffer themselves against the consequences of ill health through their capacities for storing and transmitting knowledge, and for dividing the labor of subsistence in flexible ways. Class, ethnic, and sex/gender differences are examined to assess the significance of disease and health as factors in cultural evolution. Prerequisites: 2A, 2B; or consent of the instructor. (HEF III)  
5 units, Spr (Barnett)

174. **Bioethics and Anthropology**—(Graduate students register for 274.) The relevance of moral and ethical issues in health and illness, the development of scientific knowledge, and applications of biomedical technology from an anthropological perspective. The ways moral problems in science and technology are culturally situated, defined, and resolved in specific historical, political, social, and economic contexts. Examine research ethics for anthropologists studying health and illness. Focus is on the cultural production of moral dilemmas in biomedicine and healing practices in diverse cultures.  
5 units, Spr (Koenig)

**ANTHROPOLOGICAL GENETICS**

180. **Human Evolutionary Genetics**—(Graduate students register for 280.) The evolution of modern humans as inferred from available genetic data. Quantitative methods are used to analyze mitochondrial DNA and allele frequencies. Inference of human migrations and expansion. Genetic support for models of the evolution of modern humans. Comparison of genetic data with archaeological and linguistic data. Emphasis is on critical reading of the literature. Prerequisite: 2A, 2B; or equivalents. Recommended: introductory statistics. (HEF II, III)  
4-5 units (Mountain) not given 2000-01

181. **Genes and Culture through Time and Space**—Exploration, through the use of computer modeling, of the parallels and interactions between human history, genes, and culture. When do we observe similarities between genetic and cultural patterns? What are the uses of models? Does greater complexity always improve a model? What are the advantages and disadvantages of simulation? Is it easier to predict genetic or cultural patterns? When do they influence one another? Students generate hypotheses, run simulations necessary to test these hypotheses, and analyze the output of the simulations. Prerequisites: 2A, 2B; or consent of instructor. (HEF III, V)  
5 units (Mountain) not given 2000-01

189. **Research Methods in Anthropological Genetics**—(Graduate students register for 289.) Practical training and experience in the molecular biology and data analysis techniques currently applied in anthropological genetics. Collection of samples, DNA extractions, polymerase chain reaction (PCR), gel electrophoresis, DNA sequencing. Basic techniques in the analysis of population genetic data. Prerequisites: 2A, 2B; or consent of instructor. (HEF V)  
5 units, Spr (Mountain)

**SPECIAL COURSES**

190. **History of Theory in the Anthropological Sciences**—(Graduate students register for 290A.) Required of all majors. Seminar on foundational texts in anthropology, from Darwin and Marx to Geertz and Sahlins. Emphasis is on the materialist and evolutionary theories of culture. Presentations by members of the faculty. (WIM)  
5 units, Aut (Gates)

192. **Data Analysis in the Anthropological Sciences**—The univariate, multivariate, and graphical methods used for analyzing quantitative data in anthropological research. Archaeological and paleobiological examples illustrate various methods. Recommended: knowledge of algebra. (HEF V)  
5 units (Klein) not given 2000-01

193. **Prefield Research Seminar**—Prepares for field or laboratory research. Students develop testable hypotheses and realistic data collection procedures, reviewing common data collection techniques including participant-observation, interviewing, surveys, and sampling procedures as appropriate. Emphasizes theory-guided empirical work. Prerequisites: 2A, 2B, or equivalents; and declared concentration track. (HEF V)  
5 units, Spr (Staff)

194. **Postfield Research Seminar**—Undergraduates analyze and write about material gathered during summer fieldwork. Emphasizes writing and revising as key steps in analysis and composition. Students critique classmates' work and revise their own writing in light of others' comments. (HEF V)  
5 units, Aut (Staff)

195. **Research Project**—Independent research conducted under faculty supervision, normally taken junior or senior year in pursuit of an honors project. May be taken for more than one quarter for credit. Prerequisite: completed application to the honors program.  
1-10 units, any quarter (Staff)

196. **Honors/Master's Writing Workshop**—For students in the process of writing honors' or master's papers. Techniques for interpreting data, organizing bibliographic material, writing, editing, and revising. Preparation of papers for conferences and publications in anthropology.  
2-5 units, any quarter (Staff)

197. **Internship in Anthropological Sciences**—Provides undergraduates with the opportunity to pursue their area of specialization in an institutional setting (e.g., a laboratory, a clinic, a research institute, or a government agency, etc.).  
4-5 units, any quarter (Staff)

198. **Museum Methods**—Individually directed work on anthropology collections. Introduction to the computerized storage and retrieval systems, cataloging, exhibit techniques. Can be taken for one or two quarters...
by arrangement with instructors. (HEF V)
1-4 units, any quarter (Rick)

199. Directed Individual Study—(Graduate students register for 299.)
Opportunity for advanced students to explore special areas of interest.
1-10 units, any quarter (Staff)

GRADUATE

These courses are intended for graduate students. However, advanced undergraduates may be admitted with consent of the instructor.

201A. History of Anthropological Theory, 18th and 19th Centuries—Comparative analysis of the major 18th- and 19th-century social theorists (Boas, Darwin, Freud, Marx, Morgan, Tylor, Weber) and a historical examination of their contributions to the rise of anthropology.
5 units (Wolf) not given 2000-01

5 units (Wolf) not given 2000-01

202. Political Economy and Gender Theory—Evolutionary theory as it relates to the emergence of varied political economies. Readings: Marx, Sahlins, Geertz, and Bloch. Recommended: working knowledge of Darwinian theory.
5 units (Gates) not given 2000-01

203. Theory and Method in Cultural Evolution—Graduate section; see 103.
5 units (Durham) not given 2000-01

204. Culture and Politics in South Asia—Seminar on the ethnographies of S. Asia, a region unparalleled in its ecological and cultural diversity, in its range and intensity of social conflict, and in its cultural expressions. Themes: nationalism, religious violence, class conflict, and the fate of indigenous peoples. A close look at S.-Asia ethnographies and exemplary models, to guide future student research.
5 units (Staff) not given 2000-01

205. Applied Anthropology—Anthropologists apply their knowledge and skills to a variety of problems: developing and evaluating medical care delivery systems and educational programs at home and abroad; assisting in the transfer of technological innovations and predicting and measuring their impact; serving as planners, administrators, and advisers for developing programs. The substance of such programs, the utility of anthropological theory and research approaches in solving contemporary problems, and the ethics of professional practice.
5 units (Barnett) not given 2000-01

207. Culture and Cognition—(Same as Psychology 179.) Graduate section; see 107.
5 units, Aut (Hirschfeld)

208. Models and Imaging in Anthropological Computing—Develops skills in working with digital imagery relevant to anthropology, using ANSI microcomputers. Hands-on seminar in which some specific background information and methodology is made available, and a sharing of skills goes on between participants and instructor.
3 units, Spr (Rick)

209. Research Methods in Cultural Anthropology—Introduction to basic cultural field methods: interviewing; observation; taking and using field notes; linguistic elicitation; mapping; film, video, digital, and tape recording; archival documents and historical materials; questionnaires, surveys, and statistics. The ethics of field research (prefield, field, and postfield); the relationship of methods to research problems and data analysis; and procedures for maintaining physical and mental health in the field.
5 units (Barnett) not given 2000-01

212. Linguistic Anthropology—Seminar on language in its cultural contexts. Topics similar to those in ANSI 4, but reading emphasis is on journal articles rather than monographs.
5 units (Fox) not given 2000-01

213. Topics in Linguistic Anthropology (Vocabulary and Culture)—Seminar on society, culture, and cognition as reflected in vocabulary; semantic analysis and universals of terminological systems; vocabulary size, abstraction, and the issue of primitiveness; variation, tropes, and strategy in vocabulary use. Emphasis is on the vocabularies of identity (kinship, personal names, and the body) and the environment (plants, animals, and place).
5 units, Aut (Fox)

219. Linguistic Field Methods—Graduate section; see 119.
5 units, by arrangement (Fox)

220. China for Social Analysts—The analytic constructs for the holistic study of 19th- and 20th-century China. See instructor for reading list.
5 units (Gates) not given 2000-01

230. Genetics and Modern Human Origins—Graduate seminar focusing on when and where modern humans originated. Did the most recent common ancestors of modern humans exist 1 million or 50,000 years ago? Where did they live, and what other hominid groups existed? Does the available genetic data enable us to distinguish between the competing theories of the origin of modern humans? What kinds of data are necessary for testing these hypotheses? How much can genetic data tell us about our origins? What is the impact of conclusions regarding our origins? Emphasis is on critical reading and discussion of recent literature.
5 units (Mountain) not given 2000-01

232. Human Evolutionary Anatomy—Focus is on the basis for reconstructing the form, adaptation, and life style of prehistoric humans: the interpretation of their skeletal remains. Integrating features: musculature, body size, stance, brain size, organization, activity patterns, sexual dimorphism, and speech potentiality.
5 units (Staff) not given 2000-01

233A. Beginning Osteology—Graduate section; see 133A.
5 units, Aut (Maggioncalda)

233B. Advanced Osteology—Graduate section; see 133B.
5 units, Win (Staff)

235. Human Evolutionary Systematics—Recent developments and debates in the application of evolutionary systematics specifically to the human fossil record; the utility of cladistic vs. phenetic methods, especially at the species and subspecies level; trait definition and conceptualization; and the utility of heterochronic and functional information in phylogenetic reconstruction.
4-5 units (Staff) not given 2000-01

236. Evolution and Aggression—Seminar on aggression in human and non-human primates. Topics: primate and early hominid origins of aggression, the place of aggression in the evolution of complex societies, and critiques of theories of aggression.
5 units (Maggioncalda) not given 2000-01

237. Climate and Human Evolution—Patterns of human morphological diversity and adaptive response to climate has played a pivotal role in human evolution. The role of technology and cultural buffering in
238. Evolutionary Psychology—(Same as Psychology 168.) Graduate section; see 138.
5 units, Win (Hirschfeld)

239. Evolutionary Anthropology: Theory and Methods—The history of evolutionary theory from the 19th century to present, emphasizing anthropological applications. The theory and methods behind classical evolutionary anthropology, unilinear and multilinear evolution, functionalism and neo-evolutionism, sociobiology, evolutionary psychology, and dual inheritance theory. Prerequisite: graduate standing or consent of the instructor.
5 units (Durham) not given 2000-01

240. Stone Tools in Prehistory—Graduate section; see 140.
5 units (Rick) not given 2000-01

241. Hunter-Gatherers in Archaeological Perspective—Graduate section; see 141. (HEF II)
5 units, Win (Rick)

242. Beginnings of Social Complexity—Models and examples of the social evolution of stratification and political centralization in prehistoric human societies. Inferences from the archeological record concerning the forces and mechanisms behind the rise and fall of complex societies, particularly in S. America.
5 units (Rick) not given 2000-01

247. Animal Bones for the Archaeologist (Faunal Analysis)—Seminar focuses on the vertebrate skeleton and methods for reconstructing past environments and ecology from assemblages of fossil bones. Emphasis is on how bones from ancient archaeological sites are used to reconstruct their human environments and ecology. Enrollment limited.
5 units (Klein) not given 2000-01

248. Dating Methods in Archeology and Paleonanthropology—Seminar on the primary geochronological methods used to date archeological and human fossil sites and to calibrate major transitions in human evolution. The fundamental principles of radiometric, paleomagnetic, and thermoluminescence techniques; extensive use of real archeological samples. Field trips to U.S. Geological Survey and Lawrence Livermore Laboratory. Prerequisite: knowledge of algebra. Recommended: basic chemistry.
5 units (Klein, Bischoff) not given 2000-01

5 units, Win (Durham)

251. Anthropological Solutions to Environmental Problems—The actual and potential role of anthropology in helping solve major environmental problems. Case studies: anthropologists and human rights in Central America; anthropologists and indigenous peoples in Brazilian rainforests; anthropologists and development interests in Indonesia, Australia, and sub-Saharan Africa. Emphasis is on the role of culture and social variables in the design of successful solutions to environmental problems.
5 units (Staff) not given 2000-01

252. Political Ecology—Seminar on the causes and consequences of environmental degradation in diverse social and ecological settings. Emphasis is on the role of political and economic forces in ecological change, including forces that promote differential access to resources within and between local populations. Case studies: tropical deforestation, rangeland degradation, soil erosion, drought, and famine.
5 units (Durham) not given 2000-01

266. Human Evolutionary Ecology—How theories and models from evolutionary ecology can elucidate patterns of human adaptation and behavior. Review of various models from optimal foraging theory; analysis of prey and patch choice, mobility, group size, and subsistence risk. Case studies on human populations living in arctic, tropical, and arid environments.
5 units, Spr (Lu)

266B. Fishing for Solutions: Issues in Marine Conservation—Graduate section; see 166B.
3-5 units Win (Novy)

267. Social Policy for Sustainable Resource Use—Graduate section; see 167.
5 units (Irvine) not given 2000-01

269. Research Methods in Ecological Anthropology—The methods utilized in ecological and environmental anthropology. Topics survey techniques for agricultural and demographic data, mapping and field measurement, energy flow, time allocation, and transect and quadrant sampling.
5 units (Staff) not given 2000-01

270. Advanced Medical Anthropology—Students work on a predeter-
mined research problem of their choice in medical anthropology and as it progresses, and present their work for supportive discussion and assistance. Prerequisite: 140 or consent of instructor.
5 units, Win (Barnett)

272. Evolutionary Medicine—Graduate section; see 172.
5 units, Spr (Cronin)

274. Bioethics and Anthropology—Graduate section; see 174.
5 units, Spr (Koenig)

280. Human Evolutionary Genetics—Graduate section; see 180.
4-5 units (Mountain) not given 2000-01

281. Genes and Human Behavior—Graduate seminar focusing on the extent to which genes have been linked to human behavior. The methods used for inferring a genetic basis of human behavior: primate studies, twin studies, medical research. Emphasis is on the critical evaluation of research.
5 units (Mountain) not given 2000-01

282. Colonization and Migration in Human Evolution—For graduate students and advanced undergraduates. Seminar bridging the biological and social science studies of migration, genetic microevolutionary theory, and human evolution. Colonization and migration in human history and prehistory. How have social structure, mating patterns, and other factors influenced the extent and pattern of human migration? How have migration and colonization influenced patterns of human genetic variation? When have humans colonized new areas or invaded regions on a large scale? Can we infer such processes from patterns of modern or prehistoric human genetic variation? Focus is on a set of case studies; in the initial spread from Africa, the peopling of the Americas, and the spread of agriculture through Europe.
5 units, Aut (Mountain)
(Enroll in Law 649.)
2 term units (Greely, Cox) not given 2000-01

289. Research Methods in Anthropological Genetics—Graduate section; see 189.
5 units, Spr (Mountain)

SPECIAL COURSES

290. Graduate Core Seminar—Required of all graduates students in residence. Year-long seminar on topics and issues in anthropological sciences. First quarter emphasis is on the current and future research efforts of departmental faculty. Topics for subsequent quarters include: aggression; race, gender, and inequality; anthropology and evolutionary theory; disease; and demography.
1-5 units, Aut, Win, Spr (Staff)

291. Research Methods in Anthropology—Graduate seminar on the use of the scientific method in anthropological research. Published papers from various subfields illustrate effective research design, the formulation and testing of hypotheses, and comparative methods. Field exercises in interviewing, observation, and the taking and use of field notes. The ethics of field research and procedures for maintaining physical and mental health in the field.
5 units, Win (Barnett)

292. Data Analysis in the Anthropological Sciences—Graduate section; see 192.
5 units (Klein) not given 2000-01

293. First-Year Paper/A.M. Paper Writing Seminar—Provides students with assistance and guidance with first-year paper and masters' thesis.
2-3 units, Win, Spr (Mountain)

294. Proposal Writing Seminar—Required of all ANSI Ph.D. students. Hands-on practical training in grant writing methods. Students draft a research prospectus based on their own interests and proposed projects, and work closely with their advisers and other faculty.
5 units, any quarter (Staff)

295. Research in Anthropological Sciences—Supervised work with an individual faculty member on the student research project. May be taken for more than one quarter.
5 units, any quarter (Staff)

296. Graduate Internship—Provides graduates with the opportunity to pursue their area of specialization in an institutional setting (e.g., laboratory, clinic, research institute, government agency, etc.).
4-5 units, any quarter (Staff)

297. Teaching Assistantship—Supervised experience as assistant in one undergraduate course.
5 units, any quarter (Staff)

298. Dissertation Writing Seminar—Required of all ANSI Ph.D. students. Students work closely with their advisers and committee members to write a draft of their dissertation.
5 units, any quarter (Staff)

299. Directed Individual Study—(Graduate section; see 199.) Opportunity for advanced students to explore special areas of interest.
5 units, any quarter (Staff)

APPLIED PHYSICS

Emeriti: (Professors) Marvin Chodorow, C. Chapin Cutler, Theodore H. Geballe, W. Conyers Herring, Peter A. Sturrock; (Professors Research) Bertram A. Auld, H. John Shaw, Herman Winick; (Courtesy) Gordon S. Kino, William E. Spicer

Chair: Robert L. Byer

Assistant Professors: Ian R. Fisher, Martin Greven, Kathryn A. Moler

Professors (Research): Calvin F. Quate, Helmut Wiedemann

Courtesy Professors: Bruce M. Clemens, James S. Harris, Lamberto Hesselnk, David A. B. Miller, Douglas D. Osheroff, Shoucheng Zhang

Consulting Professors: Richard G. Brewer, John D. Fox, Bernardo A. Huberman, Stuart S. P. Parkin, Daniel Rugar

Visiting Associate Professor: Subramanian Subbiah

The Department of Applied Physics offers qualified students with backgrounds in physics or engineering the opportunity to do graduate course work and research in the physics relevant to technical applications and natural phenomena. These areas include accelerator physics and synchrotron radiation, atomic physics and lasers, biophysics, condensed matter physics, materials physics, solid state and quantum electronics, and space science and astrophysics. Student research is supervised by the faculty members listed above and also by various members of other departments such as Electrical Engineering, Materials Science and Engineering, Physics and occasionally Biological Sciences, Chemistry, and faculty of the Medical School who are engaged in related research fields. Research activities are carried out in research laboratories and centers on campus and at the Stanford Linear Accelerator Center.

The number of graduate students admitted to Applied Physics is limited. Applications should be received by January 1, 2001. Graduate students normally enter the department only in Autumn Quarter.

UNDERGRADUATE PROGRAM

MINORS

Applied Physics currently does not offer an undergraduate major. The following minor program is intended for undergraduate non-physics science and engineering majors seeking to broaden and deepen their knowledge of modern physics, with an applied flavor. The minor consists of three required 4-unit courses, covering quantum mechanics and statistical physics, and a minimum of three breadth courses. The total number of units required for the minor is not less than 21 units and not more than 36 units.

Required Applied Physics courses are:

Course No. & Subject Units
150. Applied Quantum Mechanics I 4
151. Applied Quantum Mechanics II 4
152. Applied Statistical Mechanics 4

Breadth Applied Physics courses (choose a minimum of three) are:

172. Physics of Solids I (Enroll in Physics 172) 3
192. Introductory Biophysics 3
195. Waves and Diffraction in Materials (Enroll in Mat. Sci. & Engr. 195) 4
196. Scattering Physics 4
198. Introduction to Synchrotron Radiation 3
231A. Lasers I (Enroll in Elect. Engr. 231) 3
231B. Lasers II (Enroll in Elect. Engr. 232) 3

Prerequisites for the minor include the Physics 40 series (or equivalent), the Mathematics 40 series and Mathematics 130 (or equivalents), and preferably Mathematics 103 and 132. Applied Physics 150, 151, and 152 provide an extra one-hour section each week for students who need to develop the necessary mathematical and physical background.
All courses fulfilling the minor must be taken for a letter grade, except when letter grades are not offered.

The minor declaration deadline is no later than the last day of the quarter two quarters before the quarter of degree conferred. For example, a student graduating Spring Quarter must declare the minor no later than the last day of Autumn Quarter of the senior year.

**GRADUATE PROGRAMS**

Admission requirements for graduate work in Applied Physics include a bachelor’s degree in physics or an equivalent engineering degree. Students entering the program from an engineering curriculum should expect to spend at least an additional quarter of study acquiring the background to meet the requirements for advanced degrees in Applied Physics.

**MASTER OF SCIENCE**

The University’s basic requirements for the master’s degree are discussed in the “Graduate Degrees” section of this bulletin. The minimum requirements for the degree are 36 units, of which at least 30 units must be graduate-level courses in applied physics, engineering, mathematics, and physics. The required program consists of the following:

1. Courses in physics and mathematics to overcome deficiencies, if any, in undergraduate preparation.
2. Basic graduate courses:
   a) Advanced Mechanics—one quarter, 3 units: Physics 210
   b) Electrodynamics—two quarters, 6 units: Physics 220, 221; Electrical Engineering 241, 242
   c) Quantum Mechanics—two quarters, 6 units: Physics 230, 231
3. Additional advanced courses in science and/or engineering, not including Directed Study (Applied Physics 290) or 1-unit seminar courses, to complete the requirement of 36 units.
4. A final overall grade point average (GPA) of ‘B’ is required for courses used to fulfill degree requirements.

There are no department or University examinations, and a thesis is not required. If a student is admitted to the M.S. program only, but later wishes to change to the Ph.D. program, the student must apply to the department’s Admissions Committee.

**DOCTOR OF PHILOSOPHY**

The University’s basic requirements for the Ph.D. (residency, dissertation, examination, and so on) are discussed in the “Graduate Degrees” section of this bulletin. The program leading to a Ph.D. in Applied Physics consists of course work, research, qualifying for Ph.D. candidacy, a research progress report, a University oral examination, and a dissertation as follows:

1. **Course Work**
   a) Courses in physics and mathematics to overcome deficiencies, if any, in undergraduate preparation.
   b) Basic graduate courses* (letter grades required):
      1) Advanced Mechanics—one quarter: Physics 210
      2) Statistical Physics—one quarter: Physics 212
      3) Electrodynamics—two quarters: Physics 220, 221; Electrical Engineering 241, 242
      4) Quantum Mechanics—two quarters: Physics 230, 231
      5) Laboratory—one quarter: Applied Physics 207, 208, 304, 305; Electrical Engineering 357, 410; Physics 201, 202, 203, 301; Materials Science and Engineering 171, 172, 173
   c) 18 units of additional advanced courses in science and/or engineering, not including Directed Study (Applied Physics 290), Dissertation Research (Applied Physics 390), and 1-unit seminar courses. Only 3 units at the 300 or above level may be taken on a satisfactory/no credit basis.
   d) A final average overall grade point average (GPA) of ‘B’ is required for courses used to fulfill degree requirements.
   e) Students are normally expected to complete the specified course requirements by the end of their third year of graduate study.

2. **Research**: may be conducted under the supervision of a member of the Applied Physics faculty or appropriate faculty from other departments.

3. **Ph.D. Candidacy**: satisfactory progress in academic and research work, together with passing the Ph.D. Candidacy Qualifying Examination, qualifies the student to apply for Ph.D. candidacy which must be completed before the third year of graduate registration. The examination consists of a seminar on a suitable subject delivered by the student before the faculty academic adviser (or an approved substitute) and two other members of the faculty selected by the department.

4. **Research Progress Report**: normally before the end of the Winter Quarter of the fourth year inclusive of pertinent graduate study prior to Stanford, the student arranges to give an oral research progress report of approximately 30 minutes, of which a minimum of 10 minutes should be devoted to questions from the Ph.D. reading committee.

5. **University Ph.D. Oral Examination**: consists of a public seminar in defense of the dissertation, followed by private questioning of the candidate by the University examining committee.

6. **Dissertation**: must be approved and signed by the Ph.D. reading committee.

*Requirements for item 1b may be totally or partly satisfied with equivalent courses taken elsewhere, pending the approval of the Graduate Study Committee.

**ASSISTANTSHIPS**

Research assistantships are available for Ph.D. candidates. Information on applying for financial aid is included in the admission packet received from Graduate Admissions, the Registrar's Office.

**COURSES**

(AU) indicates that the course is subject to the University Activity Unit limitations (8 units maximum).

79Q. Stanford Introductory Dialogue: Pros and Cons of Energy Options in the 21st Century—Preference to sophomores. Meeting the energy and transportation needs in the 21st century requires technological capability and political wisdom. Both benefit from an understanding of underlying sciences involved. The possibilities for reducing the present day less-than-optimum use of energy and materials. Other topics: automotive transport; electrical power technology including nuclear fission, superconducting power transmission, hydrogen fuel; greenhouse gases, ozone, and global warming.

2 units, Aut (Geballe)

150. Applied Quantum Mechanics I—(Graduate students enroll in Electrical Engineering 222.) For undergraduates. Introduction to quantum mechanics, emphasizing applications in modern devices and systems. Topics: Schrödinger’s equation, eigenfunctions and eigenvalues, operator approach to quantum mechanics, solutions of simple problems (including quantum wells, harmonic oscillators, simple periodic structures), tunneling, calculation techniques (including matrix diagonalization, perturbation theory, variational method), time-dependent perturbation theory (including application to optical absorption), fundamental postulates of quantum mechanics. Prerequisites: Physics 45 and 47, or Physics 65, or equivalents.

4 units, Aut (Miller)

151. Applied Quantum Mechanics II—(Graduate students enroll in Electrical Engineering 223.) For undergraduates. Continuation of 150, including more advanced topics: spin and identical particles; effective mass theory for semiconductors; annihilation and creation operators; density matrices; introductory quantum optics; and other topics in electronics, optoelectronics, and optics. Prerequisite: 150.

4 units, Spr (Miller)

152. Applied Statistical Mechanics—For undergraduates. The principles of statistical mechanics and quantum statistical physics. Fundamental concepts of equilibrium and non-equilibrium systems and noise
processes. Density matrix, master equations, Langevin equations, fluctuation-dissipation theorem. Illustrative in-class problem solving sessions elucidate the central ideas and methods.

4 units, not given 2000-01

172. Physics of Solids I—(Enroll in Physics 172.)
3 units, Spr (Greven)

3 units, alternate years, given 2001-02

195. Waves and Diffraction in Solids—(Enroll in Materials Science and Engineering 195.)
4 units, Win (Clemens)

196. Scattering Physics—For undergraduates; see 218. Prerequisites: 150, 151, and Physics 172 or equivalent.
4 units, not given 2000-01

198. Introduction to Synchrotron Radiation—For students using such radiation for basic and applied research and students in accelerator physics concentrating on source developments and the study of particle beam characteristics and stability. Electromagnetic radiation from relativistic electron beams, derived from first principles. Coherent and incoherent synchrotron radiation, free electron lasers; undulator and wiggler radiation with linear and elliptical polarization. Recommended: electromagnetism, optics, and special relativity.

3 units, Spr (Wiedemann) alternate years, not given 2001-02

207. 3 units, Win (Fox)
208. 3 units, Spr (Fox), alternate years, not given 2001-02

210. Advanced Particle Mechanics—(Enroll in Physics 210.)
3 units, Aut (Petter)

211. Biophysics of Sensory Transduction—(Enroll in Biological Sciences 211.)
4 units, Spr (Block)

212. Statistical Mechanics—(Enroll in Physics 212.)
3 units, Spr (Laughlin)

215. Numerical Methods for Physicists and Engineers—Review of basic numerical techniques with additional advanced material: derivatives and integrals; linear algebra; linear least squares fitting, FFT and wavelets, singular value decomposition, linear prediction; optimization, nonlinear least squares, maximum entropy methods; deterministic and stochastic differential equations, Monte Carlo methods.

3 units, alternate years, given 2001-02

3 units, Spr (Shen)

217. Waves and Diffraction in Solids—(Enroll in Materials Science and Engineering 205.)
3 units, Win (Clemens)

218. Scattering Physics—Introduction to scattering techniques, including neutron, x-ray, and light scattering. Probing of phase transitions and excitations in condensed matter. Emphasis on magnetic scattering from experimental model systems and from novel materials. Topics: low-dimensional magnets, e.g., Heisenberg chains and planes; and magnetic fluctuations in high-temperature superconductors. “Global” scattering probes are contrasted with “local” probes, e.g., nuclear magnetic resonance (NMR) and muon spin resonance (muSR). Prerequisites: 150, 151, and Physics 172 or equivalent.
3 units, not given 2000-01

3 units, Aut (Linde)

220, 221. Classical Electrodynamics—(Enroll in Physics 220, 221.)
220. 3 units, Win (Silbergeist)
221. 3 units, Spr (Zhang)

222. Applied Quantum Mechanics I—Enroll in Electrical Engineering 222.
3 units, Aut (Miller)

3 units, Spr (Miller)

225. Quantum Information—Fundamental concepts of quantum theory: linear superposition, entanglement, non-locality and projective measurement. Two photon interference and Bell’s inequality. Fundamental limit in quantum measurement: quantum nondemolition measurement, non-linear measurement and quantum zero effect. Quantum key distribution and teleportation: information, energy dissipation and reversible computer. Quantum algorithms, physical implementation and scaling law. Quantum hardware. Decoherence of quantum systems and quantum error correction codes.

3 units, Spr (Yamamoto)

230A, B. Quantum Mechanics—(Enroll in Physics 230, 231.)
230A. 3 units, Aut (Shenker)
230B. 3 units, Win (Chu)
optical bistability. Optical pumping and spectroscopy of atomic and other four wave mixing interactions such as wavefront conjugation and related Raman and Brillouin scattering, Coherent Anti-Stokes scattering, harmonic generation, parametric oscillators, modelocking, stimulated emission, and quantum coherent phenomena.

268L. Introduction to Modern Optics Laboratory—Optional laboratory component to 268A.
3 units, Aut (Byer)

272. Solid State Physics: Survey—Crystal structures and symmetry, phonon spectra and energy bands, defects, surfaces, equilibrium and transport properties, Fermi-Thomas and quantum screening, surfaces, optical properties, magnetism, and superconductivity. Prerequisite: some knowledge of quantum mechanics, and preferably undergraduate solids.
3 units, Aut (Byer)

273. Solid State Physics: Continuation—Second quantization, microscopic theory of superconductivity, transition metals and compounds, magnetic resonance, inelastic and many-body effects. Prerequisite: 272.
3 units, Win (Byer)

290. Directed Studies in Applied Physics—Special studies under the direction of a faculty member for which academic credit may properly be allowed. May include lab work or directed reading.
any quarter (Staff)

291. Practical Training—Opportunity for practical training in industrial labs. Arranged by student with the research adviser’s approval. A brief summary of activities is required, approved by the research adviser.
3 units, Sum (Staff)

301. Astrophysics Laboratory—Enroll in Physics 301.
3 units, Sum (Walker)

304. Lasers Laboratory—Laser theory and practice. Lectures on the theoretical and descriptive background for lab experiments, detectors and noise, lasers (helium neon, beams and resonators, argon ion, cw dye, titanium sapphire, semiconductor diode, and the Nd:YAG). Measurements of laser threshold, gain, saturation, and output power levels. Laser transverse and axial modes, linewidth, and tuning, Q-switching and modelocking. Limited enrollment. Prerequisites: Electrical Engineering 231 and 232, or consent of instructor.
3 units, Win (Byer)

305. Nonlinear Optics Laboratory—Emphasis is on laser interaction with matter. The laser devices provide the radiation required to explore the linear and nonlinear properties of matter. Experiments on modulation, harmonic generation, parametric oscillators, modelocking, stimulated Raman and Brillouin scattering, Coherent Anti-Stokes scattering, other four wave mixing interactions such as wavefront conjugation and optical bistability. Optical pumping and spectroscopy of atomic and molecular species. Limited enrollment. Prerequisites: 304, Electrical Engineering 231 and 232, or consent of instructor.
3 units, Spr (Byer)

324. Introduction to Accelerator Physics—Introduction to basic accelerator physics in linear and circular accelerators. Topics: acceleration, phase stability, transfer matrices, beam envelopes, emittance, and the effects of synchrotron radiation. Topics of current research, including nonlinearities and instabilities.
3 units, alternate years, given 2001-02

3 units, Spr (S. Harris)

3 units, Aut (Hesselink) alternate years, not given 2001-02

3 units, alternate years, given 2001-02

3 units, alternate years, given 2001-02

3 units, alternate years, given 2001-02

3 units, alternate years, given 2001-02

3 units, Win (Yamamoto)

390. Dissertation Research
any quarter (Staff)

392. Topics in Molecular Biophysics—Concepts from statistical mechanics are applied to problems in contemporary molecular biology: allosteric transitions; protein folding; molecular recognition; actin polymers and gels; molecular motors; lipids and membrane proteins; ion channels. Some of the basic models used to quantitate fundamental biomolecular functions. Prerequisites: elementary statistical mechanics and chemical kinetics.
3 units, Win (Doniach) alternate years, not given 2001-02
453. Special Topics in Accelerator Physics—Research level discussions of current topics in accelerator physics. Content varies each quarter and year, depending on the interests of staff and students. Course may be repeated. Offered occasionally.

453A. Storage Ring Beam Dynamics—The phenomenology of particles and beams in storage rings. Topics: beam generated signals, instabilities, the beam-beam interaction, and non-linearities. Theoretical treatment combined with discussions of experimental techniques and observations. 3 units, Aut (Siemann)

459. Frontiers in Interdisciplinary Biosciences—Cross-listed in multiple departments in the schools of Humanities and Sciences, Engineering, and Medicine; students should enroll directly through their affiliated department, if at all possible. Introduction to cutting-edge research involving interdisciplinary approaches to bioscience and biotechnology; for specialists and non-specialists. Associated with Stanford’s Clark Center for Interdisciplinary Bioscience, and held in conjunction with a seminar series meeting twice monthly during 2000-01. Leading investigators from Stanford and throughout the world speak on their research; students also meet separately to present and discuss the ever-changing subject matter, related literature, and future directions. Prerequisite: keen interest in all of science, with particular interest in life itself. Recommended: basic knowledge of biology, chemistry, and physics. 1 unit, Aut, Win, Spr (Block)

463. Special Topics in Astrophysics—Enroll in Physics 463.

470. Condensed Matter Seminar—Discussion of current research and literature in condensed matter physics offered by faculty, students, and outside specialists. (AU)

473. Special Topics in Condensed Matter Physics—Research-level discussions of current topics in condensed matter physics. Content varies each quarter and year, depending on the interests of staff and students. Course may be repeated. Offered occasionally

473A. Condensed Matter Physics—Students undertake background study prior to each weekly seminar offered through 470 as an introduction to topics of contemporary interest in condensed matter physics; critique each seminar for success in oral communication, and present one-hour seminar on a contemporary topic for critique by the class. Corequisite: 470. 2 units, Aut (Greven)

473B. Physics of Disordered Systems—Disorder effects in electronic materials, e.g., disordered superconductors, magnets, and low dimensional systems. 3 units, Win (Kapitulnik)

473C. Physics of Strongly Correlated Electron Systems—Survey of recent advances in the physics of strongly correlated electron systems: Kondo effect, heavy fermion physics, slave boson methods, models of high Tc superconductivity, fractional quantum hall effect, anyon representations. 3 units, Spr (Doniach)

483. Optics and Electronics Seminar—Weekly presentations and discussions of current research topics in lasers, quantum electronics, optics, and photonics by faculty, students, and invited speakers. (AU)

STANFORD ARCHAEOLOGY CENTER

Co-Directors: Ian Hodder (Cultural and Social Anthropology), Ian Morris (Classics, and History)

Affiliated Faculty: Ian Hodder (Cultural and Social Anthropology), Laura Jones (Campus Archaeology), Richard Klein (Anthropological Sciences), Gail Mahood (Geological and Environmental Sciences), Jody Maxmin (Art and Art History, and Classics), Ian Morris (Classics, and History), Joanna Mountain (Anthropological Sciences), Amos Nur (Geophysics), John Rick (Anthropological Sciences), Tom Seligman (Cantor Art Center), Mike Shanks (Classics)

The Stanford Archaeology Center brings together various faculty and staff members with direct interest in archaeology, and highlights the fact that archaeology is a bridging discipline. From its inception in the 18th and 19th centuries, archaeology has been linked to history and the humanities on the one hand and to the natural sciences on the other. In recent decades archaeological use of the natural sciences has burgeoned, but so too has archaeology as a component of historical enquiry and as a part of ethnographic, social, and cultural research.

The program builds on the well specified research interests of the archaeology faculty in Cultural and Social Anthropology, Anthropological Sciences, and Classics without confining the practice to any one focus in particular. Faculty and staff from Geological and Environmental Sciences, Geophysics, as well as the Cantor Art Museum and the Office of the Campus Archaeologist are also central to the program.

The strength of the program is its holistic approach to an archaeology that is theoretically aware and which makes full use of multiple methods from a variety of sources. Faculty research areas include Greece, Italy, Central Europe, Turkey, Peru, Southern Africa, and North America and cover periods from early humans to historical periods and contemporary study of material culture.

UNDERGRADUATE MINOR

In addition to meeting the University requirements for the undergraduate minor, all undergraduate minors in archaeology are expected to complete a minimum of six courses with a minimum of 27 units. Students who wish to minor in Archaeology should contact the Archaeology program director, who will then assign a faculty adviser.

Required Courses (two courses, 10 units)—Students are required to take both:

Course No. and Subject Units

Gateway:
Anthro. Sci. 3. Introduction to Prehistoric Archaeology* 5

Capstone:
Cult. & Soc. Anthro. 139. Archaeology in the Modern World* 5

* Anthropological Sciences is highly recommended as a first course and many of the upper-level courses in archaeology require this course as a prerequisite. Cultural and Social Anthropology 139 is considered a capstone course, and it is recommended that students take this as the last course in their minor program.

Area of Concentration (two courses, 10 units)—Students must also choose, with the approval of the Archaeology program director, an area of concentration in archaeological research to be defined by a minimum of two courses. These courses should provide both breadth and depth in a specific research area. Concentrations should be focused on the archaeology of a particular geographic area, special topics studies, or focused analyses. Sample concentrations include Mediterranean Archaeology, New World Archaeology, Hunter-Gatherer Archaeology, and the Archaeology of Complex Societies. Concentration courses are as follows:

Hunter-Gatherer Archaeology:
Anthro. Sci. 130. Modern Human Origins 5
Anthro. Sci. 140. Stone Tools in Prehistory 5
Anthro. Sci. 141. Hunter-Gatherer Archaeology 5
Anthro. Sci. 142. Incas and their Ancestors 5
Cult. & Soc. Anthro. 173. Hunter-Gatherers in Latin America 5
Cult. & Soc. Anthro. 174. Trade and Exchange in Archaeology 5

234
ARCHAEOLOGY OF COMPLEX SOCIETIES:

Anthro. Sci. 111. Language and Prehistory 5
Anthro. Sci. 122. The Maya 5
Anthro. Sci. 140. Stone Tools in Prehistory 5
Anthro. Sci. 141. Hunter-Gatherer Archaeology 5
Anthro. Sci. 142. Incas and their Ancestors 5
Anthro. Sci. 143. State Formation in South America 5
Cult. & Soc. Anthro. 137. Introduction to Archaeological Methods 5
Geog. and Envir. Sci. 1. Fundamentals of Geology 5
Geog. and Envir. Sci. 112. Mapping the Geological Environment 4
Geog. and Envir. Sci. 140. Geomorphology 3
Geog. and Envir. Sci. 195. Remote Sensing and GIS 3
Geog. and Envir. Sci. 196. Introduction to GIS 2
Geoph. 50Q. Earthquakes and Archaeology 5
Archaeological Skills (one course, minimum 2 units)—Students must take at least one course in archaeological skills such as archaeological fieldwork, botanical analysis, cartography, ceramic analysis, dating methods, faunal analysis, genetics, geology, geographic information systems, geology, geomorphology, geophysics, osteology, remote sensing, soil chemistry, and statistics. The following are skill courses:
Anthro. Sci./Cult. and Soc. Anthro. 91. Archaeological Field Methods 5
Anthro. Sci. 192. Data Analysis in Anthropological Sciences 5
Anthro. Sci. 282. Colonization and Migration in Human Evolution 5
Classics 129. Archaeological Materials and the Survival 5
Classics 137. Introduction to Archaeological Methods 5
Geog. and Envir. Sci. 1. Fundamentals of Geology 5
Geog. and Envir. Sci. 112. Mapping the Geological Environment 4
Geog. and Envir. Sci. 140. Geomorphology 3
Geog. and Envir. Sci. 195. Remote Sensing and GIS 3
Geog. and Envir. Sci. 196. Introduction to GIS 2
Geoph. 50Q. Earthquakes and Archaeology 5
Archaeological Issues (one course, 5 units)—Students must take at least one course in archaeological issues which integrate theory, skills, and data such as the archaeology of complexity, archaeological theory, or material culture. These courses may be drawn from graduate-level courses with the approval of the instructor. The following are issue courses:
Anthro. Sci. 141. Hunter-Gatherer Archaeology 5
Anthro. Sci. 143. State Formation in South America 5
Classics 181. History of Archaeological Thought 5
Classics 300. The Problem of the East in Archaic Greece (graduate) 5
Classics 306. Archaeologies of the Recent Past (graduate) 5
Cult. and Soc. Anthro. 174. Trade and Exchange in Archaeology 5
Cult. and Soc. Anthro. 259. Approaches to the Body (graduate) 5

ART AND ART HISTORY

Emeriti: (Professors) Keith Boyle, Lorenz Eitner, John LaPlante, Suzanne Lewis, Frank Lobdell, Dwight C. Miller, Nathan Oliveira, Michael Sullivan
Chair: Richard Vinograd
Associate Chair for Studio Art, Director of Studio Art Program, and Principal Adviser to Undergraduate Studio Majors: Kristina Branch
Principal Adviser to Undergraduate Art History Majors: Jody Maxmin
Director of Graduate Studies in Studio Art: David Hannah
Director of Graduate Studies in Art History: Alexander Nemirov

Professors: Wanda M. Corn (American Art, on leave Autumn), Elliot Eisner (Art Education), David Hannah (Painting, on leave Autumn), Matthew S. Kahn (Design), Richard Randell (Sculpture), Paul V. Turner (Architectural History)

Associate Professors: Kristina Branch (Painting/Drawing), Michael Marrinan (18th- and 19th-century European Art, on leave Autumn), Jody Maxmin (Ancient Art), Melinda Takeuchi (Japanese Art), Richard Vinograd (Chinese Art)

Assistant Professors: Paolo Berdini (Renaissance Art, on leave Autumn), Scott Bukatman (Film Studies), Enrique Chagoya (Painting/Drawing, on leave Autumn), Leah Dickerman (Modern Art, on leave Winter, Spring), Pamela Lee (Contemporary Art, on leave 2000-01), Alexander Nemirov (American Art, on leave Autumn)

Affiliated Professor: John H. Merryman (Art and Art History, Law)
Senior Lecturer: Joel Leivick (Photography)
Lecturers: Kevin Bean (Painting/Drawing), Ellen Handler Spitz John Zarobell (Modern/Contemporary Art)
Visiting Assistant Professor: Frazer Ward (Modern/Contemporary Art)

The department offers courses of study in: (1) the history of art, and (2) the practice of art (studio), with major concentrations in painting and drawing, sculpture, design, and photography. The undergraduate program of the department is designed to introduce students to the humankind study of the visual arts. The courses are intended to increase an understanding of the meaning and purpose of the arts, their historical development, their role in society, and their relationship to other humanistic disciplines such as literature, music, and philosophy. The work in classroom and studio is designed to intensify visual perception of the formal and expressive means of art and to encourage insight into a variety of technical processes.

The Iris and B. Gerald Cantor Center for Visual Arts at Stanford University is a major resource for the department. The center offers a 22,000 object collection on view in rotating installations in 18 galleries and the Rodin Sculpture Garden, and a diverse schedule of special exhibitions, educational programs, and events. Through collaborations with the teaching program, student internships, and a range of student activities, the center provides a rich resource for Stanford students.

ART HISTORY

Over the past two decades the study of Art History has changed dramatically to include the study of art forms made far afield from the traditional core of Western Europe and to re-examine its objects in light of new critical frameworks. The Art History program promotes a plurality of approaches to the study of art by encouraging majors to construct a program of study drawn from the broad offerings of the Art History curriculum and the university-at-large.

UNDERGRADUATE PROGRAMS

BACHELOR OF ARTS

Requirements for the Art History major at Stanford depend upon a simplified chronological framework not linked directly to the time periods usually employed in the description of events in the history of Europe. The chronological categories for the major in Art History at Stanford are: pre-classical, classical, medieval, premodern, and modern. At the same time, the faculty has recognized the need to describe geographically the field of inquiry appropriate to Art History. To that end, it has divided the Art History major into four large regions: European; Post-Columbian American; Asian; and the native arts of Africa, Oceania, and the Americas (AOA).

The requirements for the major in Art History introduce students to the general methods of the field (Foundation), help them become familiar with a broad cross-section of its contents (Proficiency and Overview), and encourage them to concentrate in an area where they will develop sharp critical skills and the good habits of sound scholarship (Concentration and Research).

All courses for the major in Art History must be taken for a letter grade.
FOUNDATION COURSES

Foundation courses introduce the specialized vocabulary, forms of analysis, and principal themes of Art History. To this end, Introduction to the Visual Arts (Art History 1) is essential and should be taken early in the student’s career. This course also fulfills Stanford's Writing in the Major requirement (WIM). Other foundation-level courses introduce the broad, but nonetheless specialized, concerns of Asian Art (Art History 2), Architecture (Art History 3), and Film (Art History 4). For the major in Art History, students are required to take Art History 1 and at least one other foundation-level course. Interested students can elect to take more than two Foundation Courses, but no more than three count towards fulfillment of the bachelor’s degree.

PROFICIENCY REQUIREMENTS

The history and criticism of works of art are written in many languages and published in many cultures. Majors in Art History are expected to be able to access some of this work, and in accordance with the University’s language requirements for the bachelor’s degree, students must complete one year of college-level study (or the equivalent) in a foreign language. However, students planning to pursue the study of Art History in graduate school are strongly encouraged to master at least a reading-level proficiency in a second foreign language, and should consult with their adviser about planning this part of their program.

Works of art, by their nature, are material things rather than words, and in this way Art History differs from most of the other humanistic disciplines. In the belief that one cannot understand the physical qualities of works of art without some direct experience with the materials, majors in Art History are required to complete at least one introductory course in Studio Art using the “traditional” materials of painting, sculpture, drawing, photography, or print-making.

OVERVIEW

Because works of art are not simply made and used, but distributed and discussed over wide areas and long periods of time, majors are required to become familiar with a broad spectrum of the overall field of Art History. In the best possible scenario, majors would fulfill this requirement by the middle of their junior year.

Majors are required to take five courses of overview for a total of 20 units, and all must be taken for a letter grade. These courses must be in three different chronological periods and at least three different geographical areas (see above). So, a sample program might include three courses in Asian art (medieval, premodern, and modern), one course in European art, and another in AOA. To aid the student’s selection of overview courses, every Art History offering in the catalogue carries a “tag” that identifies its chronological and geographic focus (such as CL-EUR for “classical European”). Questions about the overview requirement should be directed to the student’s adviser.

CONCENTRATION

Most students of Art History have a “favorite” period, artist, or type of art that has drawn them to the major, and the faculty wants to encourage students to explore this interest in the widest possible manner. By the Winter Quarter of their junior year, majors are expected to file a statement with the Director of Undergraduate Studies, signed by their academic adviser, which describes the area of concentrated study and lists the courses to be taken over the next five quarters to complete the proposed concentration. If a student plans to attend an Overseas Study campus, care must be taken to ensure that any courses intended to contribute to the Art History concentration are approved in advance by their adviser.

A concentration can be defined in several ways: by a specific time-period (medieval art in Europe); by a specific medium (the history of photography); or tied together by a single theme (such as “art and technology,” or issues of gender and visual culture). Concentrations are individual programs of study worked out in discussions between a student and his or her adviser. In general, they are comprised of at least four courses in Art History, of which three must be in addition to courses fulfilling the Overview Requirements (see above).

CONTEXT

Because works of art are produced for many complex reasons, and their forms are affected by a wide range of cultural forces, majors in Art History are encouraged to explore parallel or contemporary developments in literature, history, philosophy, as well as science and the performing arts. As part of defining their area of concentration (see above), students and their advisers identify several upper-division courses in other departments, whose subject matter is directly related to their area of concentration and thus appropriate as context courses. To satisfy the context requirement for the bachelor’s degree in Art History, at least two such context courses, approved in advance by one’s adviser, must be taken for a letter grade.

RESEARCH

An essential component of the Art History major consists of helping students become familiar with works of art and with writing about them. This entails a familiarity with techniques of library research, a facility with the mechanics of art historical scholarship, practice in focusing research on clearly-defined problems, and the experience of presenting one’s findings in written or oral form. Research requirements are designed to ensure that all majors in Art History leave Stanford having mastered these essential skills.

All majors are required to attend an orientation session presented by the professional staff of the Art Library, which introduce the many tools of research and reference available on campus or through the internet. In addition, majors are allowed the special privilege of placing materials on reserve in the Art Library to facilitate their research for seminars or other projects, such as the honor’s theses (see below).

All majors are required to include within their program of study at least two research-oriented seminars that entail preparation of a research paper, a formal presentation, or both. In some cases, students are allowed to substitute a “colloquium” for one of these seminars, although in such cases it is understood that the course requirements must include a substantial research component.

CAPSTONE EXPERIENCE

The faculty are committed to offering every major a culminating (or “capstone”) experience to their investment of time and energy in the study of Art History. The most intense and sustained kind of capstone experience consists of exploring in depth, across several quarters of study, and in close collaboration with several professors, a single topic of great interest to the student. The most conducive vehicle for this kind of scholarly experience is writing an honor’s thesis. However, not every student wants to undertake such a personal commitment nor should they; but every major is required to elect at least one of the capstone options.

HONOR’S THESIS

The minimum requirements for admission to the honors program in the department is a GPA of 3.5 overall, and at least 3.5 in Art History courses. Students wishing to write an honor’s thesis must announce their intention by the middle of their junior year, and enlist at least one member of the faculty to serve as thesis adviser. It is imperative that the thesis adviser be committed to being on campus and in residence during the candidate’s senior year.

In concert with this adviser (who need not be the student’s academic adviser), candidates for the honors program must submit for consideration by the entire faculty a short (five page) thesis proposal, along with at least one completed paper that demonstrates his or her ability to conceptualize issues and to write about them. This material must be submitted to the department no later than the third week of Spring Quarter of the candidate’s junior year so that it can be read, discussed, and voted upon at the faculty’s regular meeting in early May. A candidate is accepted into the honor’s program by a simple majority.

Once admitted to the honor’s program, a student works with his or her thesis adviser to define the scope of the study, to establish a research and writing timetable, and to enlist one other faculty member to serve as the thesis reading committee. To aid the process of research and writing, students preparing an honor’s thesis are paired with a graduate student.
mentor. The summer between junior and senior years is usually devoted to refining the topic and pursuing any off-campus research. During the student's senior year, it is customary to register for up to 8 units of "Individual Work in Art History" (Art History 240) while research and writing of the thesis is advanced. Students should be aware that they can apply for GRO research grants to help finance trips or expenses relative to preparing for the research of their honor's thesis.

Students and thesis advisers should plan their schedule of work so that a complete and final manuscript is in the hands of each member of the thesis reading committee by the seventh week of the student's final quarter at Stanford. Although the thesis adviser assigns a letter grade to the completed work, both faculty readers must approve the thesis for honors before the student is qualified to graduate with that distinction.

SENIOR SEMINAR:
The department offers once a year, usually in the Spring Quarter, an advanced 5-unit seminar reserved for graduating seniors. However, students electing to write an honor's thesis in Art History may petition to take the senior seminar in their junior year. Majors who might not be in residence during the Spring Quarter of their senior year may also petition to enroll in the senior seminar during their junior year. Although the specific topic varies from year to year, the idea is that this seminar will be an opportunity for seniors to synthesize their experience of prior courses in Art History, work closely and at a high level with a faculty member in the setting of a small group, and be encouraged to engage large issues related to the field that they might not otherwise be able to explore. This course must be taken for a letter grade, and does not count as one of the two seminars described under Research Requirements (see above).

MINORS

ART HISTORY

A student declaring a minor in Art History must complete 25 units of course work in one of the following four tracks: Open, Modern, Asian, or Architecture. Upon declaring the minor, students are assigned an adviser with whom they plan their course of study and electives. A proposed course of study must be approved by the adviser and placed in the student's departmental file. Only one class may be taken for credit outside of the Stanford campus (this includes the Stanford Overseas Studies Programs).

Requirements for the Open Track: Art History 1 plus five lecture courses, colloquia, or seminars in any field.

Requirements for the Modern Track: Art History 1 plus five lecture courses, colloquia, or seminars in any aspect of 19th- to 20th-century art.

Requirements for the Asian Track: Art History 2 plus five lecture courses, colloquia, or seminars in Asian art (Art 1 may be one of the five courses.)

Requirements for the Architecture track: Art History 3 plus five lecture courses, colloquia or seminars in architectural history (Art History 1 may be one of the five courses.)

FILM

A minor in Film Studies requires four core courses and three additional courses (electives) for a total of seven courses. The required core courses are comprised of Introduction to Film Study (Art History 4), Film Theory and Formal Analysis (Art History 263), and either History of World Cinema I or II (Communication 141A or B), and a fourth course in a national cinema or film history. These introduce concepts and contexts fundamental to an understanding of the medium. Electives can be selected from courses in other departments approved for the Film Studies minor by the coordinator and core faculty for their stress on methods of film analysis. These may include courses in national cinemas, film genres, experimental and documentary film, or film theory. Courses in which film study is not a central focus may not be eligible for credit in the minor.

Upon declaring the minor, students are assigned an adviser with whom they plan their course of study and electives. A proposed course of study must be approved by the adviser and placed in the student's departmental file. Only one class may be taken for credit outside of the Stanford campus (this includes the Stanford Overseas Studies Programs)

GRADUATE PROGRAMS

MASTER OF ARTS

The Department of Art and Art History offers A.M. and Ph.D. degrees. The A.M. is granted as a step toward fulfilling requirements for the Ph.D. The department does not admit students who wish to work only toward the master's degree.

The University's basic requirements for the master's degree are set forth in the "Graduate Degrees" section of this bulletin.

Completing the University's requirements for an A.B. degree in the History of Art, or equivalent training, is required of students entering a program of study for the A.M. The required curriculum for entering students is determined by the Director of Graduate Studies through an evaluation of transcripts and records during an individual meeting scheduled with each student prior to the opening of Autumn Quarter to discuss course deficiencies.

Requirements for the Degree—The requirements for the A.M. degree in the History of Art are:

1. **Residence**: completing a minimum of three full-tuition quarters or the equivalent in partial-tuition quarters of graduate registration.

2. **Units**: completing a total of at least 36 units of graduate work in the history of art in courses at the 200 level, including a seminar in art historiography/visual theory.

3. **Languages**: reading knowledge of two foreign languages, preferably German and French or Italian. Students in Chinese and Japanese art are ordinarily expected to demonstrate reading competence in modern and classical Chinese or Japanese depending on the student's area of focus. Final determination is made in consultation with the student's primary adviser.

4. **Papers**: submission for consideration by the faculty of two term papers from among those written during the year.

5. **Area Coverage**: demonstration to the faculty, by course work and/or examination, that the student has adequate knowledge of the major areas of the history of art.

DOCTOR OF PHILOSOPHY

The University's basic requirements for the Ph.D. degree are set forth in the "Graduate Degrees" section of this bulletin. The following are departmental requirements.
**Joint Ph.D. in Art History and Humanities**

The department participates in the Graduate Program in Humanities leading to the joint Ph.D. in Art History and Humanities. For a description of this program, see the "Interdisciplinary Studies in Humanities" section of this bulletin.

**Practice of Art (Studio)**

**Undergraduate Programs**

**Bachelor of Arts**

The program is designed to develop in-depth skills in more than one area. It emphasizes the expressive potential of an integration of media, often via a cross-disciplinary, interactive path. Through collaboration and connections with scientists, engineers, and humanities scholars, the program addresses a breadth of topical and artistic concerns central to a vital undergraduate education.

Medium-based courses in digital art, drawing, painting, photography, and sculpture, along with a basic design course, introduce students to visual fundamentals. The student is required to take courses at Level 1 before moving to the intermediate Level 2 where investigations of content are emphasized. At this level, the student focuses on a range of subject matter from historical motifs (figure, still life, landscape) to contemporary ideas in design. After fulfilling Level 2 requirements, the student selects courses at Level 3, which feature combined practices. Level 3 courses are designed to stretch the student's understanding of materials and techniques. Experimental and challenging in nature, these courses cross area boundaries. Level 4 courses comprise a senior capstone experience. The Advanced Undergraduate Seminar emphasizes the investigation of visual concepts interpreted by a single medium, by cross-practices, or by collaboration among students working in a variety of materials. This seminar gives the student an opportunity to be exposed to the work of other majors in a critique-based forum directed by a visiting artist or critic. Advanced courses with a particular focus such as design, photography, or painting are offered on a rotational basis. Independent study supervised by a member of the permanent faculty is also available to the advanced student.

Students are encouraged to move through the requirements for the major in the sequence outlined. Levels 1, 2, 3, and 4 describe a sequence of course choices, not to be confused with the years freshman, sophomore, junior, and senior. Students are exposed to a range of practices early in their development in order to have a good basis of comparison if they choose to concentrate on a particular medium. This sequence of courses also broadens the students’ skills and enables them to combine materials and methods.

The major program in the Practice of Art (Studio) must total 65 units and include the following:

1. Four Level 1 courses (12-13 units) from Art (Studio) 50, 60, 70, 140, 145, 173. Two courses are to be completed before moving to Level 2.
2. Two Level 2 courses from Art (Studio) 141, 146, 160, 170, 175 (6 units) are to be completed before taking Level 3 courses.
3. Two to three Level 3 courses (6-9 units) from Art (Studio) 148, 149, 152, 169, 172, 174, 175A, 176, 271 are to be completed before taking Level 4 courses.
4. Two to three Level 4 courses (6-9 units) from Art (Studio) 142, 147, 153, 175B, 248, 249, 268, 269, 270.
5. Five art history courses (21 units). Art History 1 is taken as the basic course, followed by four additional courses. At least one of the courses must be in the modern art series (Art History 120A through 123A).
6. Electives, any level (7-11 units). As many as 6 elective units may be earned from workshops, internships, and independent study projects, supervised by a member of the permanent faculty. All units must be approved by the adviser prior to taking the workshop, internship, or independent study.
7. Total units: 65. All required course work must be taken for a letter grade; courses may not be taken satisfactory/no credit.
units earned by placement tests or advanced placement work in secondary school are not counted within the 65 units.
8. Majors are required to spend one quarter or summer pursuing studio interests at a site off campus. This requirement may be fulfilled in a number of ways including, but not limited to, Overseas Studies Programs, independent study sponsored by URO grants, the Haas Center, and so on. Students must meet with the Director of the Studio Art Program to discuss how the requirement will be met.
9. Each undergraduate major is required to attend an Art Library orientation session. Majors are to consult with the Art Library staff for scheduling information.
10. Studio majors are required to meet with both their adviser and the department’s undergraduate curriculum adviser during the first two weeks of each quarter to have course work approved and to make certain they are meeting degree requirements. The adviser’s role is important both in regard to guiding the student’s decisions within the program as well as in discussing plans for summer study and graduate work. An adviser is chosen by the student or assigned by the department.

Transfer Credit Evaluation—Upon declaring a Studio Art major, a student transferring from another school must have his or her work evaluated by a Department of Art and Art History adviser. A maximum of 13 transfer units are applied toward the 65 total units required for the Studio Art major. A student wishing to have more than 13 units applied toward the major must submit a petition to the adviser and then have his or her work reviewed by a department committee.

MINORS
The minor program in the Practice of Art (Studio) must include the following:
1. Two Level 1 courses (6-7 units) from Art (Studio) 50, 60, 70, 140, 145, 173 before taking Level 2 courses.
2. Two Level 2 courses (6 units) from Art (Studio) 141, 146, 160, 170, 175 before taking Level 3 courses.
3. Two Level 3 and/or Level 4 courses (6 units) from Art (Studio) 142, 147, 148, 149, 152, 153, 169, 172, 174, 175A, 175B, 176, 248, 249, 268, 269, 270, 271.
4. Three art history courses (13 units), including Art History 1 and one course from the modern art series, Art History 120A through 123B.
5. Total units: 31. All required course work must be taken for a letter grade; courses may not be taken satisfactory/no credit. University units earned by placement tests or advanced placement work in secondary school are not counted within the 31 units.
6. Each undergraduate minor is required to attend an Art Library orientation session. Minors are to consult with the Art Library staff for scheduling information.
7. Minors are required to meet with both their adviser and the department’s undergraduate curriculum adviser during the first two weeks of each quarter to have course work approved and to make certain they are meeting degree requirements.

OVERSEAS CAMPUS CREDIT
A minimum of 52 of the 65 units required for the Studio Art major and a minimum of 21 of the 31 units required for the Studio Art minor must be taken at the Stanford campus. In all cases, a student should meet with his or her adviser before planning an overseas campus program.

GRADUATE PROGRAMS
MASTER OF FINE ARTS
Programs for the M.F.A. degree are offered in painting, sculpture, new genres, photography, and product or graphic design.

PROGRAM IN PAINTING, SCULPTURE, NEW GENRES, AND PHOTOGRAPHY
The program provides a rigorous and demanding course of study designed to challenge and encourage advanced students. Participants are chosen for the program on the basis of work that indicates artistic individuality, achievement, and promise. Candidates should embody the intellectual curiosity and broad interests appropriate to, and best served by, work and study within a university context.

Admission Requirements—
1. Applicants must have an A.B. or B.S. from an accredited school. It is expected that the applicant have a strong background in studio art, either an undergraduate degree or at least three years of independent studio practice.
2. Applications and portfolios for the studio program must be submitted by January 15. Students accepted to the program are admitted for the beginning of the following Autumn Quarter. No applicants for mid-year entrance are considered.
3. Portfolio Specifications: 20 slides of creative work. Some of these can be drawings if relevant to the overall project. Send in a Kodak Universal carousel; no actual work is accepted. All slides must be labeled with the applicant’s name and an accompanying slide list must be included indicating the size, date, and medium of each work. If the applicant wants the portfolio returned, a stamped, self-addressed container must be included.

Requirements for the M.F.A. Degree—
1. Completing a minimum of two years (six quarters) of graduate work in residence or its equivalent at Stanford.
2. Completing 48 units of study. Students must discuss their programs of study with the department’s senior administrator to ensure that the most favorable registration arrangement is made.
3. Six quarters of the Master’s Project, which includes two weekly seminars (the Object Seminar and the Concept Seminar) and Studio Practice, which is an individual tutorial with a selected member of the faculty. In addition, three courses of academic electives are required in the first year. These courses can be chosen from a large variety of disciplines in consultation with the faculty adviser.
4. The student is expected to pass three faculty reviews: (1) at the end of the first quarter (anyone judged to be making inadequate progress is placed on probation and will require an additional review at the end of the second quarter), (2) at the end of the third quarter, and (3) at the time of the M.F.A. exhibition. The purpose of these reviews is to evaluate development and to assess the progress of the student.
5. During the final quarter in the program, students must write a thesis paper addressing the development of their work over the two-year period at Stanford. Participation in the M.F.A. exhibition at the end of the year is required.
6. All students, regardless of their source of funding, are required to assist with the department’s teaching program for a minimum of eight hours per week over the period of six quarters; the particulars of this assignment are at the department’s convenience.
7. The Studio faculty reserve the right to make use of graduate paintings, sculpture, and photographs in exhibitions serving the interests of the graduate program.

Graduate students must remain in residence at Stanford for the duration of the program.

THE GRADUATE PROGRAM IN DESIGN
Working jointly, the departments of Art and Art History, and Mechanical Engineering offer graduate degrees in product and visual design. A large new physical environment, the Design Yard, provides professional-caliber studio space and well-equipped shops. Flexible programs may include graduate courses in fields ranging from graphic to engineering design, typography to biotechnology, marketing to microcomputers. The program centers on a master’s project and may also include work in advanced art and design. The program is structured to balance independent concentration with rich utilization of the University and the community, and personal interaction with the students and faculty of the graduate Design program. Cross-disciplinary interaction is encouraged by a four-person graduate Design faculty.

An A.M. degree with a specialization in Design is offered to qualified students who prefer to participate in the graduate program for only one year.
Admission—The M.F.A. degree program requires:
1. Applicants must have an A.B. or B.S. from an accredited school. It is expected that the applicant will have a strong background in studio art, either an undergraduate degree or at least three years of independent studio practice.
2. Portfolio Specifications: twelve slides or photographs of creative work. All slides must be labeled with the applicant’s name. If a carousel is sent, an accompanying slide list must be included indicating the size, date, and medium of each work; otherwise, slides should be labeled with the same information and sent in the standard cardboard box received from processing. If applicants want portfolios returned, a stamped, self-addressed container must be included.

Requirements for the Degree—The M.F.A. degree with a specialization in design requires:
1. Completing a minimum of two years (six quarters) of graduate work in residence or its equivalent at Stanford.
2. Completing in the first year 54 units of course work chosen in consultation with an adviser. At least 18 of the 54 units must be in Art (Studio) 360A, B, C and Mechanical Engineering 211A, B, C.
3. Participating in a weekly seminar in which the student’s work is criticized and discussed in detail.
4. As a part of their training for the M.F.A. degree, all students, regardless of their source of funding, are required to assist with the department’s teaching program for a minimum of eight hours per week over the period of six quarters; the percentage of work assigned in a given quarter is at the department’s convenience.

Graduate students must remain in residence at Stanford for the duration of the program.

ART EDUCATION
Information concerning the A.M. in Teaching, Doctor of Education, Ph.D. in Education, and Teaching Credential (Single Subject-Secondary) degrees and programs may be secured from the Office of the Dean of the School of Education.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

HISTORY OF ART

BASIC

1. Introduction to the Visual Arts—Introduction to the critical problems of understanding, analyzing, and writing about the visual arts. The approach is multicultural and topical rather than historical. Discussion sections. GER:3a (DR:7) (WIM)
   5 units, Aut (Lewis)
   Spr (Berding)

2. Art and Culture in Asia—The religious and philosophical ideas and social attitudes of India, China, and Japan and how they are expressed in the architecture, painting, woodblock prints, sculpture, and in such forms as garden design and urban planning. Discussion sections. GER:3a,4a (DR:2 or 7)
   5 units, Win (Vinograd)

3. Introduction to the History of Architecture—Selective survey of architecture from antiquity to the 20th-century; mostly Western with some non-Western topics. For each period, specific buildings and general principles relevant to the study of architecture are examined.
   5 units (Turner) not given 2000-01

4. Introduction to Film Study—Develops basic aesthetic and conceptual analytic skills with relevance to cinema, studying formal, historical, and cultural issues. Familiar models of narrative cinema are mixed with alternative structures, documentary, and experimental forms. Issues of cinematic “language” and visual perception, representations of gender, ethnicity and sexuality. Weekly screenings. GER:3a (DR:7)
   4 units, Win (Bukatman)

STANFORD INTRODUCTORY SEMINARS

   4 units Win (Corn)

61Q. Stanford Introductory Seminar: Comics—A Lively Art—Preference to sophomores. The history and aesthetics of comics, a medium that spans the 20th century, existing in dynamic relation to emerging mass media (e.g., cinema) and to modernist and postmodernist aesthetic and narrative practices. The innovators in comic strips (humorous and dramatic), superheroes, Heavy Metal, undergrounds and independents, political intervention, autobiography, and (of course) manga. Required assigned film viewings.
   4 units, Aut (Bukatman)

OVERVIEW COURSES

THE CLASSICAL WORLD

101/301. Archaic Greek Art— (Same as Classics 100A/200A.) The development of Greek art from Protogeometric beginnings to the decades preceding the age of Pericles. (PC-EU) GER:3a (DR:7)
   4 units, Aut (Maxmin)

102/302. Classical and Hellenistic Greek Art—The formation, in 5th-century Athens, of the classical ideal and its development and diffusion in the centuries that followed. (CL-EU) GER:3a (DR:7)
   4 units, Win (Maxmin)

103/303. Greek Painting—Introduction to the study and appreciation of Greek vases and their painters, especially the masters of Athenian black- and red-figure who flourished in the culturally rich and volatile era of the tyrant Peisistratos and his sons. (CL-EU)
   4 units (Maxmin) not given 2000-01

104/304. Roman Art— (Same as Classics 100C/200C.) Introduction to the rich and varied art and architecture of Rome from the Etruscans to the Late Empire. (CL-EU) GER:3a (DR:7)
   4 units, Spr (Maxmin)

THE MEDIEVAL WORLD

105/305. Sites and Images of Power in 12th-Century Europe—Romanesque art and architecture in Western Europe, 1095 to 1200: structuring a new visual discourse to shape and respond to the experiences of political, spiritual, and intellectual expansion resulting from the Crusades, pilgrimage, and new learning in the schools. How spatial environments were built and systems of visual discourse designed within the ideological contexts generated by monastic and feudal institutions in centers such as Cluny, Cîteaux, Moissac, Mont Saint-Michel, Vézelay, Winchester, Canterbury, Durham, Santiago de Compostela, and Monreale. (MED-EU)
   4 units (Lewis) not given 2000-01

107/307. Age of Cathedrals—Gothic art and architecture in Western Europe, 1150 to 1500. The structuring of a “modern” visual discourse within the ideological framework of a new monarchical Church and State, emerging towns and universities, the rise of literacy, the cultivation of self, and the consequent shifts in patterns of art patronage, practice,
Fouquet, and Bosch. The shift from court patronage to entrepreneurial art in the 17th century under the impact of secularization and Westernization, Russian art and architecture. The evolution of Muscovite architecture in the 17th century under the impact of secularization and Westernization, culminating with the reign of Peter the Great.

108/308. Late Medieval "Realism": 15th-Century French and Netherlandish Painting—Restructuring representation and reception in the art of the Limbourg brothers, Van Eyck, Van der Weyden, Van der Goes, Fouquet, and Bosch. The shift from court patronage to entrepreneurial art markets; the new status of the image, artist, viewer, and self; and the problematical premodern context of the end of the Middle Ages. (MED-EU)

4 units (Kollmann)

109/309. Apocalypse: Reading Medieval Images—The multilayered relationships between textual images and their reader-viewers in medieval illuminated Apocalypse manuscripts, and how their production and dissemination provided critical cultural mechanisms for the creation of new technologies of the self. Within this framework of subjectivity, medieval theories of vision invested images with the power to articulate and activate dominant ideological positions regarding the self, society, and the "other." The medieval Apocalypse became a powerful paradigm for the definition of such problematical medieval experiences as the Crusades, anti-Judaism, and expectations of the world's end. (MED-EU)

4 units (Lewis) not given 2000-01

EUROPE 1400-1900

110/310. Renaissance Painting—Survey of 15th- and 16th-century painting in Rome and Florence in light of the artistic practices and cultural attitudes that characterized the visual culture of the Renaissance. The circumstances of patronage, secular and religious, set the framework through which important artistic episodes of Renaissance imagery, from the revival of antiquity to Christian neo-Platonism, find historical explanation. Works by Masaccio, Masolino, Beato Angelico, Filippo Lippi, Paolo Uccello, Ghirlandaio, Piero di Sozimo, Mantegna, Piero della Francesca, Botticelli, and Leonardo. (EM-EU) GER:3a (DR:7)

4 units, Win (Berdini)

112/312. The Venetian Renaissance—Venetian painting of the Renaissance in light of the exchange between the center and periphery that characterizes Venice's visual culture. After the acquisition of land dominions, the terraferma, in the first half of the 15th century, Venice, the center, promised forms of interaction (social, political, and cultural) among the diverse regions of the periphery. By renewing, absorbing, and valorizing the characteristics of the local schools of painting, Venice realized its own Renaissance. The pictorial genre of the pastoral is a typical reception between the urban center and the agrarian periphery. Focus is on the works of Carpaccio, Bellini, Giorgione, Savoldo, Lotto, Titian, Veronese, Bassano, and Tintoretto. (EM-EU)

4 units (Berdini) not given 2000-01

114/314. Renaissance Women—The ways in which models of feminine beauty were constructed and processed in the literary and visual culture of the Renaissance. Whether, in the guise of goddesses, courtesans, or others, the feminine image partook of a discursive arena in which its social, mythological, and erotic valencies required readers and beholders to evolve new forms of response. Reception theory and gender studies offer the theoretical framework for discussing artistic forms from Titian's paintings to Petrarchan poetry. (EM-EU)

4 units (Berdini) not given 2000-01

115/315. Renaissance Architecture, 1420-1580—Established first in Florence with Brunelleschi's buildings and Alberti's theory, Renaissance architecture produced a variety of typological and decorative innovations throughout Italy. The circumstances of patronage and context, physical or cultural, are examined to address the formal and iconographical novelties of a highly theoretical architecture. Context and theory are the privileged criteria according to which works by Brunelleschi, Michelozzo, Francesco di Giorgio, Bramante, Peruzzi, Raphael, Sangallo, Giulio Romano, Michelangelo, Alessi, Sanmicheli, Sansovino, Palladio and Vignola are studied. (EM-EU)

4 units (Berdini) not given 2000-01

4 units (Turner) not given 2000-01

117/317. Baroque Painting—The visual culture of Italy, France, and Spain, 1590-1660, focusing on the works and legacies of Carracci, Caravaggio, Guercino, Guido Reni, Poussin, and Velasquez. Theoretical issues (e.g., Naturalism). Emphasis is on what constitutes a Baroque image and what are the conditions of its beholding. (EM-EU)

4 units (Berdini) not given 2000-01

121/321. 18th-Century Art in Europe, ca. 1660-1780—The major developments in painting across Europe from the High Baroque illusionism of Bernini (Rome) and the founding of the French Academy (Paris) to the international revival of antiquity during the 1760s, with parallel developments in Venice, Naples, Madrid, Bavaria, and London. Lectures situate shifts in themes and styles amidst the emergence of new viewing publics. Artists: the Tiepolos, Giordano, Batoni, and Mengs; Ricci, Pellegrini, and Thornhill; Watteau and Boucher; Chardin and Longhi; Reynolds and West; Hogarth and Greuze; Vien, Fragonard, and the first works by David. Additional hour discussion each week for graduate students. (EM-EU)

4 units (Marrinan) not given 2000-01

122/322. Painting in the Age of Revolution—Survey of painting in Europe within the context of the French Revolution and its aftermath. Lectures align ruptures in the traditions of representation with respect to shifting social formations and political events. Artists: David and his students; Gros and the painters of Napoleon; Gericauld, Blake, Fuseli, and Goya; Turner and Constable; Friedrich, Runge, and the Nazarenes; Ingres and Delacroix. Additional hour discussion each week for graduate students. (M-EU) GER:3a (DR:7)

4 units, Win (Marrinan)

124/324. The Age of Naturalism, ca. 1830-1874—The origins, development, and triumph of naturalist painting in Europe. Lectures underscore the creative tensions between the traditional ambitions of painting and the challenge of new "modern" subjects and the emerging practice of working in the open air. Artists: Corot, Rousseau, and the painters of Barbizon; Courbet, Millet, and Daumier; the pre-Raphaelites; Manet and his circle; the early works of Monet, Renoir, Degas, and friends. Additional hour discussion each week for graduate students. (M-EU) GER:3a (DR:7)

4 units, Win (Marrinan)

126/326. Post-Naturalist Painting—How conceptual models from language, literature, new technologies, and scientific theory affect picture-making following the collapse of the radical naturalism that characterized European painting of the 1860s and early '70s. Bracketed in France by the first Impressionist exhibition (1874) and the first public acclamation of major canvases by Manet and Monet (1869), the related developments in England, Germany, and Austria. Artists: the Impressionists and Cezanne; Moreau, Redon, and Rops; Van Gogh and the Fauves; Gauguin, Les XX, and Munch; Seurat and Signac; Puvis de Chavannes, Burne-Jones, Whistler and Klimt; Horta, van de Velde and...
Guimard; Beardsley, Vallotton, and Toulouse-Lautrec. Additional hour discussion each week for graduate students. Recommended: some prior experience with 19th-century art. (M-EU)

4 units (Marrinan) not given 2000-01

BRITAIN AND AMERICA 1600-1900

130/330. Art in America and Britain, 1670-1825: Culture and Politics—Interdisciplinary study of major themes and genres of British and early American art. Focus is on art in relation to the French and Indian Wars, the American Revolution and the invention of American national identity, and the art of indigenous peoples, particularly the Iroquois. Close readings of works of art. Artists: Copley, West, Trumbull, Allston, Hogarth, Wright of Derby. (EM-AM) GER:3a (DR:7)

4 units, Aut (Nemerov)

131/331. American Art and Culture, 1670-1860—The development of portraiture and history painting in the colonies and of landscape and genre painting in the new nation. The difficulties of establishing artistic communities and patronage in a new society, the exchange and interaction with Europe, and the search for a uniquely American expression. Focus is on Copley, Peale, West, Trumbull, Stuart, Mount, Bingham, and the Hudson River School. (EM-AM)

4 units, Aut (Corn) not given 2000-01

133/333. American Art and Culture in the Gilded Age, 1865-1910—Interdisciplinary study of art, literature, patronage, and cultural institutions of the late 19th century. Aestheticism, conspicuous consumption, the grand tour, and the expatriate experience. The period’s great collectors, taste makers, and artists: Thomas Eakins, Winslow Homer, Mary Cassatt, James Whistler, John Singer Sargent; Albert Pinkham Ryder, William Harnett, and John Peto. (MOD-AM)

4 units (Corn) not given 2000-01

136/336. Decadence and Reserve: Visual Art in Britain, 1880-1915—In-depth study of the great artists working in Britain, 1880-1915, including John Singer Sargent, Aubrey Beardsley, Walter Sickert, Gwen John, etc. Emphasis is on the art, and on the literary productions of the time: the Bloomsbury writers; Arthur Conan Doyle, especially his Sherlock Holmes. The era’s imperial and gender politics, manifested in the Boer War and the women’s suffrage movement. (MOD-EU)

4 units, Win (Nemerov)

MODERN EUROPE

4 units (Berdini, Turner) not given 2000-01

141/341. The Invention of Modern Architecture—The creation and development of new architectural forms and theories, from the late 18th to the early 20th centuries, mainly in Europe but also in America. Emphasis is on the responses to new materials, technologies, and social conditions, and how they shaped the architecture of our own time. Recommended as preparation for 142. GER:3a (DR:7)

4 units, Aut (Turner)

142/342. Varieties of Modern Architecture—The development of competing versions of "modern" and "post-modern" architecture and design in Europe and America, from the early 20th century to the present. Recommended: 141. GER:3a (DR:7)

4 units, Win (Turner)

143/343. A History of Photography—Surveys photography from its invention in the 19th century to the present. Working from images in the collection of the Stanford Museum, the San Francisco Museum of Modern Art, and important primary and critical texts, the focus is on the nature of photographic representation and the changing status of photography as an artistic and social practice. (MOD-EU/AM)

4 units (Dickerman) not given 2000-01

144/344. Modernism and Abstraction—The various histories, ideologies, and meanings of abstraction in 20th-century art Cubism, German Expressionism, suprematism, Constructivism, Neo-Plasticism, Abstract Expressionism, Brutalism, hard-edge abstraction, Minimalism, and process art. (MOD-EU)

4 units (Dickerman, Lee) not given 2000-01

145/345. Making the Modern: European Art, 1890-1914—What is modernism? The avant-garde practice, 1890-1914, as a spectrum of complex responses to issues of modernization (the growth of the metropolis, industrialization, and emergence of modern forms of subjectivity) which radically transformed the nature of the art object itself. Readings emphasize the work of contemporary theorists and critics: Rainer Maria Rilke and Georg Simmel. Movements include: art nouveau, Viennese art and design, German Expressionism, Fauvism, Cubism. Artists: Auguste Rodin, Gustav Klimt, Adolf Loos, Vasily Kandinsky, Henri Matisse, and Pablo Picasso. Sections mandatory. GER:3a (DR:7)

4 units, Aut (Dickerman)

146/346. Rebellion, Revolution, and Reaction: European Art between the Wars—(Enroll in Feminist Studies HOT.)

3 units, Aut (Latimer)

147/347. The Bauhaus—The Bauhaus was an artistic idea, a school, and a social project. Its original curriculum was conceived by architect Walter Gropius in Weimar, Germany, at a time when architecture, painting, sculpture, and the applied arts were theorized and practiced under a common aesthetic and social agenda. Throughout its brief, intense life (1919-1933), the Bauhaus promoted a variety of artistic experiences that explored in different media the relationship between form and technique. Avant-garde and institutional, the Bauhaus constructed a unique visual culture of modernity grounded in experiment and rationality. The pedagogic principles, artistic theory, and practical activity of the school’s individual laboratories (architecture, design, photography, graphics, tapestry). (MOD-EU)

4 units (Berdini) not given 2000-01

148/348. Art under Hitler and Stalin—The role of the visual arts (architecture, exhibition design, painting, sculpture, photography) in Nazi Germany and Stalinist Russia. The relationship between art and totalitarianism, the uses of new systems of mass media, the similarities and distinctions between the two regimes, and the possibilities for critical resistance in the visual arts. (MOD-EU)

4 units (Dickerman) not given 2000-01

MODERN AMERICA

150/350. American Architecture and Urbanism—The development of architecture and city planning in the U.S. since colonial times, concentrating on those characteristics and problems that are distinctively American. (MOD-AM)

4 units (Turner) not given 2000-01
150A/350A. American Vernacular Architecture—Introduction to a variety of N. American building traditions by people who are not academically trained as architects. Focus is on European, African, and Native American traditions that shaped the most familiar and widespread folk architectures, and on the urban landscapes of 19th- and 20th-century African Americans and European and Asian immigrants. Rural and urban house types, vernacular building systems, commercial architecture, the public landscape, the vernacular landscapes of work and religion, and the built environment as expressions of ethnic and racial identities, organizers of social life, and conscious works of art. (MOD-AM)
4 units, Win (Upton)

151/351. Transatlantic Modernism: Paris and New York in the Early 20th Century—Modernism in the American arts at home and abroad, emphasizing transatlantic expatriation, cultural politics, and creative alliances. Painters and sculptors are the focus. The literary figures who interacted with artists (Gertrude Stein, William Carlos Williams, and Langston Hughes). Topics and artists: the Armory Show, Marcel Duchamp, Francis Picabia, Futurism, Fernand Léger, Alfred Stieglitz, Charles Demuth, Georgia O'Keeffe, Gerald Murphy, the Harlem Renaissance, John Storr, and Florine Stettheimer. Discussion sections. (MOD-AM)
153/353. Regionalisms—Comparative study of four cultural regionalisms of the 1920s and '30s: New York City (especially Harlem), the South, the Midwest, and the West (particularly the Southwest). The meanings artists attached to place, the invention of rhetoric and sign systems that stood for geographic districts, and the cultural politics of regional rivalry. Topics: Harlem Renaissance; Southern Agrarians; Midwestern Triumphvrate (Thomas Benton, Grant Wood, and John Curry); the artist colonies of Taos and Santa Fe. The representations of California as "region" in "Pacific Arcadia," a spring exhibition at the Stanford Museum. (MOD-AM)
4 units (Corn) not given 2000-01

155/355. American Art since 1945—Introduces the major figures, movements, and concepts of American art (with examples from Europe) from WW II to the present. Topics: the ideology and aesthetics of high modernism, the relationship between art and popular culture, the "death of painting," the question of postmodernism. Artists: Pollock, Newman, Stella, Johns, Warhol, Andre, Rainer, Smithson, Hesse, Serra, Kruger, Sherman. (MOD-AM)
4 units (Lee) not given 2000-01

157/357. Abstract Expressionism—The painting and sculpture of the major Abstract Expressionist artists 1935-59 (Jackson Pollock, Willem de Kooning, Franz Kline, Mark Rothko, and Adolph Gottlieb); and artists reacting to Abstract Expressionism (Ad Reinhardt, Jasper Johns, and Robert Rauschenberg). Emphasis is on works of art, and the cultural and political context in which these works were made. (MOD-AM)
4 units (Nemerov) not given 2000-01

FILM STUDIES

160/360. Cinema and the City—The 20th-century's ideas of The City are closely tied to the modernist medium of film. Cinema and the city both offer utopian built environments of perceptual and experiential richness; both are products of the same industrial and social transformations. Changing understandings of urban space (including cyberspace) are seen in a range of films from European and American narrative traditions, industrial films, experimental cinema, documentaries, and musical sequences. Emphasis is on the crime film, science fiction, and the "city symphonies" of the '20s. Weekly screenings required. Recommended: 4 or its equivalent. (MOD-EU/AM) GER:3a (DR:7)
4 units, Spr (Bukatman)

162/362. Cyborgs and Synthetic Humans—The synthetic human has a long history in world mythology: fairy tales and children's stories; and in contemporary genres of horror and science fiction. Stories of artificial-ly created life, living statues, clockwork automata, alien body snatchers, robots, cyborgs, and electronic simulations direct our attention to assumed definitions of the human and the self. Synthetic human narratives in film, fiction, and comics. The meaning of labor, gender, sexuality, death, emotion, rationality, bodies, consumerism, cosmetic surgery, and reproductive technologies. (MOD-EU/AM)
4 units (Bukatman) not given 2000-01

163/363. Science Fiction Cinema—Science fiction film's sense of wonder depends upon the development and revelation of new ways of seeing. If cinema is a privileged site of technological representation, then science fiction, the genre most obsessively concerned with technology and its deployment, takes on new relevance. The American SF film's emphasis on the fundamental activity of human perception and its exploration of other worlds, new cities, and other modes of being. Science fiction as the Hollywood genre most directly concerned with the essence of cinema itself, and such new technological spaces as the cyberspaces of the information age. (MOD-AM)
4 units (Bukatman) not given 2000-01

167/367. The Hollywood Musical—The liberation that arises in the film musical, a liberation that is reality and illusion and which can be physical, emotional, aesthetic, and social, all at once. Performance is central to the genre. Musicals connect cinema to other arts. The interplay among song, stage, and screen; and the interplay of cultural identities (regional, racial, gender, and sexual). Musicals provide a place for the staging of issues of identity: sexuality and ethnicity are emphasized onscreen and off. The impact of African-American and Jewish culture on the genre; issues of gay reception and interpretation. The history of the American stage musical. (MOD-AM)
4 units (Bukatman) not given 2000-01

168/368. Subjectivity and Gender in Contemporary European Film—Cinematic reflexivity, gendering film authorship, self-imaging masculine as feminine, modernism/postmodernism, narrative/anti-narrative, sexuality and difference, and allegories of spectatorship and voyeurism are centered on the works of Godard, Beineix, Besson, Bertolucci, Pasolini, Paspandi, Wenders, and others. (MOD-EU)
4 units (Lewis) not given 2000-01

CONTEMPORARY EUROPE AND AMERICA

170/370. Art since the Sixties—Movements in art since the 1960s, especially in performance, and their relations to and implications for other practices, within art and beyond. (MOD-EU/AM)
4 units, Win (Ward)

170B/30B. Art since the Sixties—Movements in art since the 1960s, especially in performance, and their relations to and implications for other practices, within art and beyond. (MOD-EU/AM)
4 units, Spr (Ward)
technology, industrialization, mass culture, communication, and social engineering and control from the invention of photography to recent visual practices. Emphasis is placed less on "machine aesthetics" than the issue of technological rationality, e.g., the art of the last 30 years (kinetic art, video, digital photography, etc.). Recommended: some familiarity with modern art. (MOD-EU)

174/374. Object after Minimalism—Object-based art from the 1960s to the present. Minimalism, process art, earth and land art, installation and site-specific work, body art, work that comments upon the museum and gallery, new media sculpture and environments (e.g., video, digital technologies). (MOD-AM)

4 units (Lee) not given 2000-01

176/376. The Feminist Legacy in Contemporary Art—The impact of Second Wave feminism on art making and art historical practice in the 1970s, and its reiteration and transformation in contemporary feminist work. Topics: sexism and art history, feminist studio programs in the '70s, essentialism and self-representation, themes of domesticity, the body in feminist art making, Bad Girls, the exclusion of women of color and lesbians from the art historical mainstream, notions of "performativity." (MOD-AM)

4 units (Lee) not given 2000-01

180/380. Chinese Art and Culture—Topics in Chinese art from the Neolithic to the 20th century. Emphasis is on recent archaeological discoveries, newly published material, and current issues of understanding and interpretation. (CL-AS)

4 units (Vinograd) not given 2000-01

185/385. Chinese Art in the Modern Era—Topics in Chinese visual 18th century to the present, with an emphasis on the 19th and 20th centuries. Issues of identity, community, and nationality; urban centers of production and consumption; art and politics; international arts, modernity and modernisms, transnational arts and new media. (MOD-AS)

4 units (Vinograd) not given 2000-01

186/386. Theme and Style in Japanese Art—Selected monuments of traditional Japanese architecture, sculpture, garden design, painting, and pots are presented in a chronological framework representing the intersection of art and society from protohistoric times through the early 19th-century. (CL-AS) GER:3a (DR:7)

4 units, Aut (Takeuchi)

187/387. Arts of War and Peace: Late Medieval and Early Modern Japan, 1500-1688—Narratives of conflict, pacification, orthodoxy, nostalgia, and novelty are viewed through the visual culture during the change of episteme from medieval to premodern, i.e., the 16th through early 19th centuries. The rhetorical messages of castles, teahouses, gardens, ceramics, paintings, and prints; the influence of Dutch and Chinese visuality; transformation in the roles of art and artist; tensions between the old and the new leading to the modernization of Japan. (EM-AS) GER:3a (DR:7)

4 units, Spr (Takeuchi)

188/388. Painting in Late Medieval and Early Modern Japan, 1500-1688—Questions of subject and subjectivity, the role of tradition/ideology vs. innovation/resistance, responses to the Other, developing art discourse, and transformation in notions of artist, art-making, and viewer response at different levels of Japanese society. (MED/EM-AS)

4 units (Takeuchi) not given 2000-01

200. Undergraduate Colloquium: Greek Vases in the Stanford Museum—Prerequisite: 100A or equivalent.

4 units, Aut (Maxmin)

201. Colloquium: Aspects of Later Greek Art—(Same as Classics 202C.)

4 units (Maxmin) not given 2000-01

202. Colloquium: Power of Image as Icon—Late Roman and Byzantine Art and Architecture—The formation of a new visual discourse from Constantine (4th century) to the Turkish conquest of Constantinople (1452). Artistic traditions (mosaics, icons, manuscript illumination) and building types centered on patterns of reception, ideology, and patronage in Rome, Ravenna, Istanbul, Mt. Sinai, the Balkans, and Sicily.

4 units (Lewis) not given 2000-01

205. Seminar: Medieval Narrative—Visual and intertextual strategies and structures in some major medieval narrative cycles in mural and manuscript illustration, within the context of current critical theory.

4 units (Lewis) not given 2000-01

207. Colloquium: Multiculturalism and Image Appropriation—Early Medieval Art and Architecture—Western Europe from c. 700 to 1095 centered on the Celtic, Anglo-Saxon, Carolingian, Ottonian, and Spanish Mozarabic phases of hybrid cultural formation and the creation of such works as the Book of Kells, the Sutton Hoo treasure, and the plan of St. Gall. In a period of social upheaval and political fragmentation, new modes of visual discourse emerged, and remnants of the late classical tradition survived within larger ideological patterns of assimilation and change.

4 unit (Lewis) not given 2000-01

210. Seminar: The Pastoral Vision in the Renaissance—Whether secular or profane, nostalgic or premonitory, the encounter with the other offered by the voluntary retreat into the countryside fostered an artistic genre that only could be accomplished by the combined representational naturalism and classical revival of letters pursued during the Renais-
sance. A multimedial discursive field, the pastoral offered a hermeneutic experience that exposed (and continues to expose) the social, gender, and ideological prerogatives of readers and beholders. The cultural and phenomenological implications of images like Giorgione's Tempest. Critical and art-historical models of interpretation are tested from iconology to semiotics.

4 units (Berdini) not given 2000-01

211. Seminar: Humanistic Discourse on Art—The linguistic and literary modes devised by the humanists of the 15th century to account for visual experience. How the humanist form of attention, constructed on an important, limited ensemble of classical disciplines (grammar, rhetoric, poetry, history, and moral philosophy) provided a bridge between the visual and the verbal, establishing the first coherent discourse on art. Readings/discussion survey the range and main themes of humanistic theory and art criticism (mimesis, perspective, composition, emphasis, color structure, etc.) elucidating the emergence of two distinctive modes which condition subsequent discourse on art: the narrative and the descriptive. Texts by Cennini, Alberti, Guarino, Facino, Fazio,
and Leonardo, and the contemporary reception of Pliny the Elder, Plutarch, Cicero, Quintilian, and Horace.
4 units (Berdini) not given 2000-01

212. Seminar: Michelangelo and the Aesthetics of the Unfinished—Michelangelo's sculptures were often left in a state prior to completion, so as to reveal the process and the results of their making. It was left to the beholders to complete these works in their imagination, and in this regard the artist's sonnets, letters, and Neoplatonic conceptions offered critical instruction. For the reader-beholder, Michelangelo's poetry, sculpture, and related drawings constitute a complex aesthetic unity. Readings from Michelangelo's sonnets and letters, art theory, and Platonicism and Neoplatonic works.
4 units (Berdini, Harrison) not given 2000-01

213. Undergraduate Major Seminar: Renaissance Rome—Art and Ideology in the Age of Julius II (1503-13)—The role played by Bernarst’s, Michelangelo’s, and Raphael’s art in shaping Julian Rome. The papal attempt to revise the dual foundation of Rome, i.e., classical antiquity and Early Christianity. Architecture, painting, and sculpture contributed toward construction of a new visual culture for a New Rome, a city destined to be the center of Christianity and the capital of an absolutist state. Antiquarian studies, monarchical ideologies, humanistic discourses, and the new artistic practices were experimented with throughout Italy in the previous century, and shaped a pontifical project which succeeded artistically but failed ideologically, as the subsequent divisions within Christendom demonstrated.
4 units (Berdini) not given 2000-01

215. Seminar: Modified Expectations—Caravaggio and the Beholder—Contrary to academic theory, in which an image should present the beholder with an experience of higher moral value, Caravaggio's paintings, religious or profane, offer no edifying exempla. They modified the beholder with an experience of higher moral value, Caravaggio's paintings, religious or profane, offer no edifying exempla. They modified the beholder’s expectations, and were perceived as a betrayal of artistic ethics. To the classicist Poussin, Caravaggio had destroyed painting. Yet, in the process of defying the ideals of painting, Caravaggio's work discloses dimensions of beholding, and of the beholder. Interpretive strategies from reception theory to psychoanalysis. The historical and theoretical circumstances of beholding Caravaggio's images.
4 units (Berdini) not given 2000-01

221. Undergraduate Seminar: Eugène Delacroix—Born in 1798, scorned by the art establishment in his early years, heralded by the critical "avant garde" (Baudelaire) in mid-life, Delacroix died in 1863 as one of the "old masters" of the French tradition, important to young painters (Manet and Degas) as a role model for their own work. Delacroix painted in every format (small easel pictures, large-scale architectural ensembles, lithographic works, drawings and illustrated notebooks), and left a body of critical writings in the form of letters and journals. Delacroix's life and art are the means for understanding the historical person and the culture of 19th-century France. Student group reports on general topics and individual presentations on specific works by Delacroix. Enrollment limited to 16. Prerequisite: consent of instructor. Recommended: reading knowledge of French.
4 units (Marrinan) not given 2000-01

223. Seminar: Aspects of Realism in 19th-Century Painting
4 units (Marrinan) not given 2000-01

225. Seminar: Paul Cézanne
4 units (Marrinan) not given 2000-01

230. Seminar: Interpretation and History—The Art of Benjamin West—Study of Benjamin West (1738-1820), the American artist who spent most of his career in England as court painter to George III. The "new historical" emphasis on the "West" in terms of the various discourses (British colonial expansion) embodied in his art. Close readings of individual works by West and his contemporaries.
4 units (Nemerov) not given 2000-01

4 units (W. Corn) not given 2000-01

233. Seminar: The Art of the Old West—Major painters and sculptors of the American West 1880-1920, including Frederic Remington, Charles Russell, and Charles Schreyvogel. Cowboys and Indians in the context of evolutionary theory, ethnographic documentation, national symbolism, immigration and the urban world, the advent of movies, other turn-of-the-century nostalgias (e.g., New England and the Middle Ages), and questions about the recoverability of the past.
4 units (Nemerov) not given 2000-01

241. Seminar: Collage/Montage—Case studies in collage and montage practice (including Cubist collage, the films of Dziga Vertov and Sergei Eisenstein, the photomontages of Hannah Höch and John Heartfield, and the early work of Robert Rauschenberg) and the historiographical problems that this work engenders. Important 20th-century theories of fragmentation and recombination including Walter Benjamin's conception of allegory; Claude Levi-Strauss on bricolage and Jacques Derrida's reworking of this term; and Frederic Jameson and Rosalind Krauss on pastiche.
4 units (Dickerman) not given 2000-01

251. Seminar: Frank Lloyd Wright—Examination of this most influential American architect, whose work transformed domestic architecture in particular. Students choose research subjects dealing with specific designs or aspects of Wright's career. Field trips to Wright's buildings in the Bay Area. Prerequisites: 141, 142, or 150.
4 units, Spr (Turner)

253. Seminar: Le Corbusier—A study of this controversial figure in modern architecture and city planning, whose designs and writings shaped much of the contemporary environment throughout the world. Students conduct research on selected aspects of Le Corbusier's work, theory, influence, or connection with related subjects. Prerequisite: 141 or 142.
4 units (Turner) not given 2000-01

254. Seminar: Utopia and Reality in Modern Urban Planning—Primarily for Urban Studies majors, but others may be admitted. Utopian urbanist thinkers (Ebenazer Howard, Le Corbusier, Frank Lloyd Wright, etc.) who established the conceptual groundwork of contemporary urban planning practice. Student participation and research-oriented term paper required.
4 units (Stout, Turner)

255. Seminar: The American College Campus—The college and university campus is a distinctively American type of environmental planning. The historical development of the campus, its spaces and architecture. Focus is on issues relating to Stanford and other Bay Area campuses. Prerequisites: 141, 142 or 150.
4 units (Turner) not given 2000-01

256. Seminar: The Everyday Landscape—The Ordinary, the Vernacular, and the Extraordinary—The common places we visit every day, and the things we do there, asking about ways that the banal landscape is made extraordinary through the construction of odd or striking buildings or landscapes (e.g., roadside structures or "outsider" art), the attribution of religious significance to otherwise unexceptional spaces, or the commemoration of catastrophic or exceptional events in ordinary spaces. Studies of the folk and the vernacular, current works on the "everyday" by Lefebvre, deCerteau, Bourdieu, and others, and psychological and philosophical works on perception, cognition, and concepts of the self.
4 units, Spr (Upton)
257. Undergraduate Seminar: Jackson Pollock—The works of the most famous of all 20th-century American modernists, his career from the early 1930s to his death in 1956. Emphasis is on the students' abilities to think, speak, and write cogently about paintings that seem to defy discourse.

4 units, Win (Nemerov)

258. Undergraduate Seminar: War and Representation—Focus is on the battle scene in visual culture, emphasizing the period from 1770 to the present. The art of Benjamin West and John Trumbull, the Civil War photography of Alexander Gardner, and 20th-century treatments of battle, including the propaganda films of the 1940s, the epic films of the 1960s (“The Guns of Navarone”) and the uses of representation in the Gulf War.

4 units, Win (Nemerov)

259. Seminar: The Art Museum—History and Practices—Workshop on contemporary museum culture, with emphasis on the collecting and exhibiting practices of art museums. Selected readings, field trips, and discussions with museum professionals. Each student creates a detailed proposal for a museum exhibition and presents it to a panel of faculty and curators.

4 units (Corn) not given 2000-01

261. Seminar: Theories of the Moving Image—Cinema and Models of Perception—A continuing tradition in film theory has emphasized cinema in relation to human perception. What are the implications of a visual medium that is so similar to, but equally distinct from, the operations of the eye? The question becomes fully relevant in an increasingly technologized and mediated world. Theorists: Benjamin, Kracauer, Epstein, Vertov, Eisenstein, Bazin, Münsterberg, Deren, Braukhage, Baudry, Mulvey and Deleuze. Weekly screenings required. Recommended: 4.

4 units (Bukatman) not given 2000-01

263. Undergraduate Seminar: Film Theory and Formal Analysis

4 units, Spr (Bukatman)

265. Seminar: French New Wave Film (1958-68)—Theory and Practice—Exploration of a radical paradigmatic shift in cinematic modernism in the works of Godard, Resnais, Truffaut, Varda, etc. New visual narratives of existentialist freedom, eroticism, and reflexivity.

4 units (Lewis) not given 2000-01

267. Seminar: Beyond the New Wave—French Film in 1970s, ’80s, and ’90s—Postmodernism, narrative/anti-narrative, spectatorship and voyeurism, auterism and cinematic reflexivity. America as problematic intertext, inter and sexual politics, crises in gendered identity, and the “New History.” The later works of Godard, Chabrol, Renais, Tanner, Truffaut, and Varda, and younger filmmakers, such as Beineix and Kieslowski.

4 units (Lewis) not given 2000-01

271. Seminar: Site Specific and Installation Art—Drawing on precedents in early 20th-century art (De Stijl, the Bauhaus, the Russian and Soviet Avant-Garde, Schwitters), considers the thematic of place in the production and reception of site-specific work, art made for, and bound to, a particular place. Topics: the legacy of the Gesamtkunstwerk, the notion of community and the public sphere, the viewer of art as phenomenological body, the body as site, the politics of liminal space, and the critique of the museum and gallery as institutions. Artists: Smithson, Heizer, Morris, Serra, Situationist International, Antin, Piper, Asher, Buren, Matta-Clark, Broodthaers, Haacke, Wilke, Gonzalez-Torres, Holzer, Green, Wodiczko, the Border Arts Collective, Wilson, Luna, Mendieta.

4 units (Lee) not given 2000-01

280. Seminar: Mapping Urban Visual Culture in 17th-Century Nanjing—Early urban visual modernity in China is considered through a discussion of aristocratic, religious, literati, commercial, and leisure culture spaces in 17th-century Nanjing. Problems in mapping physical, social, and cultural spaces of production and consumption; discourses of taste and value; and networks of relationship.

4 units, Aut (Vinograd)

4 units (Vinograd) not given 2000-01

283. Seminar: Court and City—Pictorial Art in Qianlong Period China—Painting and printmaking in later 18th-century China, focusing on the Qianlong era (1736-95). Topics: court partonage and collecting, political and ideological functions of art-making, and the contemporary urban visual cultures of the Yangzhou-Hangzhou region in the southeast.

4 units, Spr (Vinograd)

285. Seminar: Japanese Discourse on Painting and Its Chinese Antecedents—Primarily for graduate students in Asian art and Asian languages. The “information explosion” of the 17th century, brought about by advanced technologies of printing, made accessible to the Japanese the vast body of Chinese literature on painting theory. The major texts and their influence in Japan. Material is in English; some texts are read in the original to understand key aesthetic terms.

4 units, Spr (Takeuchi)

286. Seminar: Conformity and Rebellion in 18th-Century Japanese Painting—The rise of new styles and artistic revivals, the extraordinary number of “eccentric” painters, influences from China and the West, the proliferation of art-historical treatises, and the redefinition of the role of the artist in Japanese society. Prerequisites: 2, 186, 187, 188.

4 units (Takeuchi) not given 2000-01

287. Colloquium: “Pictures of the Floating World”—Images from Japanese Popular Culture—Examines printed objects produced during the Edo period (1600-1868), including the famous Ukiyo-e (“pictures of the floating world”) and lesser-studied genres like printed books (ehon), and popular broadsheets (kawaraban). How a society constructs itself through images; questions concerning the borders of the acceptable/censorship; theatricality, spectacle, and slippage; the construction of play, set in conflict against the dominant neo-Confucian ideology of fixed social roles. Prerequisites: 2, 186, 187, 188.

4 units, Aut (Takeuchi)

288. Seminar: Warrior Culture of Japan—The ethos and cultural legacy of the Japanese warrior: how those in power stay in power; the “tools of the trade;” how the image of the warrior was constructed in literature and in the visual arts; and the relationship between visual ideology and codes of legitimacy.

4 units (Takeuchi) not given 2000-01

288A. Seminar: Nostalgia in Japanese Art—Revivals, Reformations, Representations—The foundations of classical court culture in Japan as a sphere discourse, and its various afterlives: major themes, interpretations, text-image relationships, and the ideological uses to which the classical past was put throughout traditional Japanese culture.

4 units (Takeuchi) not given 2000-01

289. Colloquium: Arts of Zen Buddhism—Primarily for seniors. Since its introduction to Japan in the medieval period, Zen and its attendant arts have produced reams of discourse, despite the well-publicized Zen distrust of the intellect. The arts produced in the Zen milieu in the context of this literature, and the myths perpetrated about Zen art in the modern era. Prerequisite: familiarity with Japanese art and culture.

4 units (Takeuchi) not given 2000-01
297. Undergraduate Major Seminar: Methods of Art Historical Research—The historiography and methodology of the discipline of art history.
4 units (Lee) not given 2000-01

298. Independent Study: Art History—Reserved for approved independent research with individual faculty members. Letter grades only. any quarter (Staff)

299. Honors Thesis Research in Art History any quarter (Staff)

GRADUATE SEMINARS

HISTORICAL STUDIES

400. Greek Vase Painting 4 units (Maxmin) not given 2000-01

401. Political Iconography—Study of 6th-century painters and the extent to which their work can be seen to reflect the history and political shenanigans of their age. Prerequisite: 100A or 102.
4 units (Maxmin) not given 2000-01

420. Crossroads of the Enlightenment—The Artistic Culture of Rome in the mid-18th Century—Rome, as a long-privileged site for training young artists, acquired new importance following the discovery of ruins at Herculaneum and Pompeii (1730-1780). Roman artistic culture, as the arena where international artists and critics, dealers, and dilettantes met and were visited by wealthy young people making the Grand Tour, became the center of the contemporary art in Europe. Students research topics and presentations on any relevant aspect of artistic life in Rome at this time: patronage and patterns of collecting, monographs on artists or writers working in the city, art practices characteristic to Rome (e.g., copying antiquities), or constructions of the "mythic" Rome in visual renderings or written accounts. Prerequisite: working knowledge of at least one non-English language.
4 units (Marrinan) not given 2000-01

434. The Visual and Literary Art of Edwardian England—Interdisciplinary study focusing on England 1895-1918. The works of major painters (John Singer Sargent); writings of Thomas Hardy, Henry James, Arthur Conan Doyle, Kenneth Grahame, and Beatrix Potter; the relation to contemporaneous American art and literature; and the English visual art and poetry of WW I and later 20th-century constructions of the Edwardian period.
4 units (Nemerov) not given 2000-01

435. Women and the Arts 1860-1930: Issues of Class and Gender—Qualified upperclass undergraduates may enroll with consent of the instructor. Research seminar examining the advent of the professional woman artist, patron, and collector and all-female art clubs and educational institutions. Cultural comparisons are encouraged: high society with women in bohemia; women in Europe with those in the Americas; mature women with those of younger generations.
4 units, Spr (Corn)

4 units (Nemerov) not given 2000-01

438. The Visual and Literary Culture of San Francisco, 1890-1915—The major artists and writers in San Francisco around the turn of the century, including Douglas Tilden, Arthur Putnam, Jack London, and Frank Norris. Publications such as The Wave and Sunset, and larger cultural phenomena such as the City Beautiful movement. An analysis of the Panama-Pacific Exposition of 1915.
4 units, Aut (Nemerov)

439. Darkness and Light—American Illustration, 1895-1915—The turn of the century, the so-called "golden age" of American illustration, produced three well-known American artists, Maxfield Parrish, Howard Pyle, and N. C. Wyeth, and many talented, now largely forgotten artists whose images fill the pages of Scribner's, Century, and other illustrated periodicals and books. Yet early 20th-century illustration is still regarded as a "low" art form not worth serious visual analysis and critical study. American illustration in historical and theoretical frameworks, emphasizing the oddness (if not the outright darkness) of this ostensibly good-natured art.
4 units (Nemerov) not given 2000-01

4 units (Dickerman) not given 2000-01

442. Russian Avant-Garde—The work of key avant-garde figures in the wake of the Bolshevik Revolution (Kazimir Malevich, Vladimir Tatlin, El Lissitzky, Liubov Popova, Varvara Stepanova, Alekandr Rodchenko, and Gustav Kluitis) as shifting responses to the question of "How is one to be an artist in the new society?" Focus is on the relation of avant-garde work to the simultaneous phenomena of revolution and the rise of a new media culture. Issues of new media, the relationship between public and private, the body and technology, the development of the model of socialist realism and avant-garde collaboration with the Stalinist regime. Commentary on this period by Soviet works from the 1980s to the present.
4 units, Aut (Dickerman)

450. World Fairs and Theme Parks—World Fairs and theme parks as communications media and social discourse. From the 1851 Crystal Palace Exhibition in London, to expositions in Paris, Philadelphia, Chicago, New York, etc., fairs have been a fascinating and conflicted site of meaning. Technological and ideological utopianism were supported by nationalist discourse, capitalist enterprise, anthropological exhibition, and varied modes of popular address. The issues that recur across the history of the fairs: display culture; utopian space; sensory immersion; technological trauma; the place of nature, art, and design; urban planning; and virtual realities. The importance of fairs in understanding the contradictory foundations of American self-definition (e.g., moral uplift vs. popular entertainment). Amusement parks, contemporary themed entertainment sites, and the 1996 Internet World’s Fair.
4 units (Bukatman) not given 2000-01

452. 1944—A year of cultural production in painting, film, and literature. Jackson Pollock's "Gothic" and Vincente Minelli's "Meet Me in St. Louis," Mark Rothko's Slow Swirl by the Edge of the Sea and Val Lewton's Curse of the Cat People. Their production in 1944 over- or undergirded the momentous events of that year. The possibilities, or impossibilities, of relating disparate but coeval cultural products to one another. The possibilities, or impossibilities, of relating these cultural products to "context." The mechanics, or organisms, of the historical method, as well as the year 1944.
4 units, Spr (Nemerov)

455. Gender, Modernism, and Art History—Revisionist scholarship of gender and sexuality in Impressionism, Dada and Surrealism, abstraction, and pop art. Students elect their own topics for research and interpretation.
4 units (Corn) not given 2000-01
460. Experimental Cinemas— Against the background of film’s novelty in the early 20th century and the ponderous movements towards an “art” derivative of literature and theater, the avant-garde has located cinematic art in spatio-temporal experiment. Beginning with Futurism, the avant-gardes of Europe, the U.S.S.R., and the U.S. celebrated and produced films that opposed narrative cinematic conventions. Through a reflexive engagement with the medium’s metamorphic fluidity, film could produce abstraction, political argument, an entry into the rhetoric of the unconscious and the realm of cognition, refusals of meaning, and explorations of perception. Films from the ‘20s through the ‘70s through historical context and formal operations.

4 units. Win (Bukatman)

474. Conceptual Art— Issues surrounding conceptual art from the ‘60s to the mid-’70s. Topics: the end of the work of art and the notion of “art as idea” or philosophical proposition; the relationship between art, language, and the document; ephemeralty and “dematerialization;” body art performativity and the public sphere. Artists: Sol Lewitt, Joseph Kosuth, Hans Haacke, Adrian Piper, Vito Acconci. Art and language: Joan Jonas, Chris Burden, Dan Graham, Bruce Nauman, Lawrence Weiner, Hannah Darboven, Danien Buren.

4 units (Lee) not given 2000-01

474A. Innocent Bystanders: Performance, Audience, Ethics— What does it mean to agree to watch an artist be shot? Seminar examines a series of violent or otherwise provocative performance by artists including Abramovic, Acconci, Burden, Ono and Smith, in terms of an inquiry into the demands they place on audiences and publics.

4 units. Win (Ward)

486. Methods and Historiography in Japanese Art— Introduces graduate students in Asian art and other disciplines to issues of historiography, research techniques, dictionaries for deciphering script styles, and other tools for advanced work in Japanese art.

4 units (Takeuchi) not given 2000-01

487. Chinese and Japanese Painting Discourse— The relationship between the large body of Chinese painting treatises and their rearticulated roles in Japan: subjectivity and ideology, realism/idealism; legitimacy; visuality; social formations. Prerequisite: knowledge of Chinese or Japanese.

4 units (Takeuchi) not given 2000-01

488. Problematizing the Japanese Landscape of Travel— The cultural construction of landscape in medieval and premodern Japan. The representation of landscapes, seen and imagined, in painting, literature, religion, and social practice. Topics: religious visions and ritual fields (mandalas, sacred mountains), sites of cult and cult of sight (Fuji, Kumano), narratives of itinerary (travel diaries, illustrated hand scrolls), and topographic taxonomies (Meisho, Shinkeizu, guidebooks).

4 units (Takeuchi) not given 2000-01

CRITICAL STUDIES

500. Methods and Historiography of Art History— Close analysis of key historical and methodological texts, providing a graduate-level introduction to the writing, history, and interpretative approaches of the discipline of art history. Authors: Berenson, Mirelli, Wolfflin, Riegl, Panofsky, Fry, Greenberg, Schapiro, Clark, Krauss, Bois.

4 units (Dickerman) not given 2000-01

501. The Vision of Art History

4 units (Marrinan) not given 2000-01

502. Visual Theory— Introduction to some major theoretical approaches in the contemporary praxis of art history and film studies. Readings/discussion are centered on the problematics of poststructuralism, semiotics, narratology, phenomenology, reception theory, issues of gender, context, and the new Marxism.

4 units (Lewis) not given 2000-01

503. Notions of “The Public” in Art Historical Discourse

4 units (Marrinan) not given 2000-01

504. Photography and Visuality— Using various case studies in 19th- and 20th-century photographic practice, explores the intersection of issues of social context, technology, and vision in the definition of historical modes of perception. Weekly meetings at San Francisco Museum of Modern Art or other collections.

4 units (Dickerman) not given 2000-01

505. Phenomenology of Film— Film and phenomenology are 20th-century developments historically and conceptually interdependent. Phenomenology investigates consciously experienced phenomena, apart from causality or presupposition. Embodied subjectivity is central to the intensely experiential medium of cinema. The ways that film foregrounds, distills, and recasts aspects of phenomenological process. The analysis of the embodiment of vision replaces the “decoding” of narrative or symbolic systems, and the easy link between cinematic illusion and ideological duplicity is replaced by an exploration of visual knowledge and subjective development. Writers and filmmakers shared the task of mapping a phenomenology of film. Authors: Bazin, Cavell, Michelson, Deleuze, Sobchack, Gunning. Filmmakers: Brakhage, Warhol, Snow, Kubrick, Gebr. Screenings emphasize experimental cinema, often an interrogation of these very issues. The historical movement away from, and the return to, phenomenology in film analysis.

4 units (Bukatman) not given 2000-01

510. Theories of the Sublime and Art— For graduate students and advanced art history majors only. The notion of the sublime through the terms of art and art history. Readings in philosophy and literary criticism (Kant, Burke, DeMan, Lacoue-Labarte, Lyotard, Nancy, Weiskel, etc.) and art historical “case studies” (European Romanticism, American landscape, modernist abstraction, earth work, and recent video).

4 units (Lee) not given 2000-01

512. The Time of the Object— How artists, art historians, philosophers, and critics have theorized the temporality of the art object. Topics: the origin of the work of art, duration, repetition, entropy, kineticism, the monument, the end of death of art, “schizophrenia.” Writers: Bergson, Deleuze, Foucillon, Fried, Hegel, Heidegger, Jameson, Kubler, Krauss, Riegl.

4 units (Lee) not given 2000-01

514. Psychoanalytic Perspectives on Art and Literature— Experiments with and critiques of psychoanalytic perspectives on a broad spectrum of visual images and literary texts. Book illustration, advertising, and the cartoon strip, and conventional media such as theater, novel, painting, and sculpture. Topics: symbolism, play, dreams, madness, the biography of the artist, fetishism, trauma. Texts: Freud, Lacan, Melanie Klein, and Winnicott.

4 units, Win (Spitz)

516. Narrative Theory and Visual Forms

4 units (Marrinan) not given 2000-01

518. Scopophilia— On Visual Pleasure— What kind of images give pleasure and why? The modalities of attention and expectation in the visual experience that resolve in what psychologists call scopophilia are analyzed within a historical horizon which moves from the neo-Platonic legitimation of aesthetic pleasure during the Renaissance (including its reconciliation with Christian faith) to the modernist emancipation of visual pleasure from mimetic representation. Readings focus on the structure and modifications of the language of appreciation as it relates to understanding, from the early theories of Leonardo, to the criticism of Diderot, modern connoisseurship, the psychoanalytic theories of Freud and Lacan, and contemporary forms of reception such as Derrida’s notion of the Gift.

4 units (Berdini) not given 2000-01
519. **Looking at Violence**—Violence in the media and its effect upon viewers, especially the young, is an issue of national concern that has produced legislation for the ratings of movies, television shows, and computer and video games. “V-chips” can be programmed to censor electronically what TV programs they play. These are political and legal fixes. Why do we watch violence in the first place? Why are images of violence compelling? Texts of aesthetics, psychology, and moral philosophy help develop detailed analysis for specific examples of visual media (painting and sculpture, film, and video). Preliminary ideas about a history of our desire to look at images of violence.

4 units (Marrinan) not given 2000-01

**RESEARCH**

600. **Art History Bibliography and Library Methods**—Primarily for art history graduate students; upper-class undergraduate majors who plan to continue in art history on the graduate level may enroll with the consent of the instructor. Introduction to reference works and library techniques essential to the study of architectural and art history. Sources of artistic, historical, and cultural information in their printed and automated forms.

3 unit, Aut (Ross)

601. **Graduate Proseminar: Graduate Studies in Art History**—For first-year art history graduate students only. Introduction to fields, issues, and practices in art history.

2 units, Aut (Nemerov)

610. **Teaching Praxis**

1-5 units, any quarter (Staff)

620. **Core Area Exam Preparation**—For art history Ph.D. candidates. Prerequisite: consent of instructor.

4 units, any quarter (Staff)

630. **Core Area Examination**

any quarter (Staff)

640. **Dissertation Proposal Preparation**

any quarter (Staff)

650. **Dissertation Research**

any quarter (Staff)

660. **Independent Study**—Reserved for approved independent research project with individual faculty members (for graduate students only).

any quarter (Staff)

**PRACTICE OF ART**

14. **Drawing for Nonmajors**

2 units, Aut, Win, Spr (Kilgallen, Dorosz)

15. **Printmaking for Nonmajors**

2 units, Aut (Colburn)

16. **Sculpture for Nonmajors**

2 units, Win (Fin)

17. **Photography for Nonmajors**

2 units, Spr (Mueller)

50. **Clay Modeling**—Entry level. The representational ideas and techniques of Rodin, Picasso, Medardo Rosso, Segal, and Duane Hanson, and the irrational approach of Jean Arp, Dubuffet, and Giacometti. Students work from the life model: library readings and slide lectures.

3 units, Aut, Win, Spr (Randell)

60. **Design I: Fundamental Visual Language**—Formal elements of visual expression (color, composition, space, and process) are experienced analytically and intuitively through hands-on projects. mediums vary and are two- and three-dimensional. Originality and inventiveness are emphasized within the constraints of each assignment. Content is realized abstractly. Centered in design, but relevant to all visual art study and meaningful to the general university student who seeking to develop visual perception.

3 units, Aut (Kahn)

70. **Photography I**—The critical, theoretical, and practical aspects of creative photography are addressed through basic camera and lab techniques. Lecture/discussion, viewing of slides, and field work. Stanford Museum and Art Gallery viewing are scheduled according to current exhibitions. 35mm camera required.

4 units, Aut, Win, Spr (Leivick, Staff)

117. **History and Philosophy of Design**—(Enroll in Mechanical Engineering 120.)

3-4 units, Spr (Katz)

130. **Inscription Technology**—The basics of sensors, processors, and actuators needed to create artworks that interact, record, and communicate. Emphasis is on the sculpture and interactive dimensions.

3 units, Aut, Spr (DeMarinis)

131. **Sound Art I**—Acoustic, digital and analog approaches to sound art. Familiarization with techniques of listening, recording, digital processing and production. Required listening and readings in the history and contemporary practice of sound art.

3 units, Aut (DeMarinis)

132. **Sound Art II**—Advanced sound production techniques, emphasizing presentation, including performance and interactive sound installation. Prerequisite: 130 or 131, or consent of the instructor.

3 units, Win (DeMarinis)

133. **Phenomena Art**—Focus is on the creation of works of art that have natural or unnatural phenomena at their root: the movements of light and water, the chaos of living and computing systems, and the response characteristics of the human sensory apparatus.

3 units, Win (DeMarinis)

140. **Drawing I**—Introduction to functional anatomy and perspective as these apply to problems of drawing the form in space. Individual and group instruction as student’s work from still life set-ups, nature, and the model. Emphasis is on the development of critical skills and perceptual drawing techniques for those with little or no previous experience with pastels, inks, charcoal, conte, and pencil. Lectures alternate with studio work in the investigation of drawing fundamentals.

3 units, Aut, Win, Spr (Staff)

141. **Drawing II**—Intermediate/advanced drawing. Observation, invention, and construction. Development of conceptual and material strategies, with attention to process and purpose. May be repeated for credit. Prerequisite: 40 or 140, or consent of instructor.

3 units, Aut, Win, Spr (Staff)

142. **Drawing III**—Advanced drawing. Emphasis is on student initiative with respect to composition, color, and use of a variety of drawing materials. Work from imagination, still life, and model. May be repeated for credit. Prerequisite: 40 or 140, or consent of instructor.

3 or more units, Aut, Win, Spr (Staff)

145. **Painting I**—Introduction to techniques, materials, and vocabulary in oil painting. Still-life, landscape, and figure are used as subject matter. Painting and drawing directly from life is emphasized.

3 units, Aut, Win, Spr (Staff)

146. **Painting II: The Self-Portrait in Painting**—Symbolic, narrative, and representational self-portraits. Introduction to the pictorial strategies, painting methods, and psychological imperatives of Durer, Rem-
brandt, Cezanne, Kahlo, Beckmann, Schiele, and Munch. Students paint from life, memory, reproductions, and objects of personal significance to create a world in which they describe themselves. Prerequisites: 140, 145, or consent of instructor.

3 units, Aut, Win, Spr (Staff)

147. Painting III—Advanced painting with emphasis on the individual point of view. May be repeated for credit. Prerequisites: three quarters of 145, 146, or equivalent, or consent of instructor.

3 or more units, Aut, Win, Spr (Staff)

148. Printmaking—Introduction to print-making using monotype, a graphic art medium used by such artists as Blake, Degas, Gauguin, Pendergast, etc. May be repeated for credit. Prerequisite: 40 or 140.

3 units, Win, Spr (Chagoya)

149. Collage—The generative principles of this most characteristic 20th-century art form. Along with assemblage (its three-dimensional equivalent) and montage (its counterpart in photography, film, and video), collage has introduced many of the crucial aesthetic issues of the modern and postmodern eras. Typically, collage creates an expressive visual language through juxtaposition and displacement, and through sheer materiality, difference, and event. Issues of location (where it happens), object (what it is), process (how it is realized), and purpose (why it is). Prerequisites: 140, 145, or consent of the instructor.

3 units, Win (Hannah)

152. Constructed Art—The non-objective inventions of the Russian Constructivists are the departure point which parallels the development of non-representational sculpture beginning in the early 20th century. Found Art, welded sculpture, Assemblage, and Kinetic Art projects direct the students’ attention to the continuing evolution of art ideas. Lectures, readings, and projects culminate in sculptures concerning art of the 1960s and ‘70s: Minimalism, Earth Works, and Process Art.

3 units, Aut (Randell)

153. Recent Sculpture Concepts and Projects—Study and practice of the art of recent decades, emphasizing current post-abstraction procedures. Various materials and nonmaterials. Prerequisite: any one of 50, 60, or 70.

3 units, Win, Spr (Randell)

160. Design II: The Bridge—The historical spectrum of design, from practical to ritual, while maintaining contact with the basic values and the conceptual orientation of visual fundamentals. Two- and three-dimensional projects are sequentially grouped to relate design theory to application, balancing imaginative and responsible thinking. Prerequisite: 60.

3 or more units, Win (Kahn)

168A. Introduction to Urban Design—(Enroll in Urban Studies 170.)

5 units, Win (Gast)

169. Professional Design Exploration—Six to eight mature projects are stimulated by weekly field trips into significant areas of design activity or need.

3 or more units, Spr (Kahn)

170. Photography II—Students individually pursue a topic of their own definition. Class sessions meet for individual and group critiques, lab demonstration, discussions, and slide lectures.

3 units, Win, Spr (Staff)

172. Alternative Processes—Priority to advanced students. Technical procedures and the uses of primitive and hand-made photographic emulsions. Enrollment limited to 10. Prerequisites: 70, 170, 270, or consent of instructor.

3 units, Aut (Leivick)

173. Digital Narratives—Focus is on developing visual narrative skills based on digital production and distribution media. Topics: digital imagemaking, storyboarding, dramatic structure, image manipulation, image sequencing, manipulation of virtual time and space, quicktime movie production and interactive web authoring. Prerequisite: working knowledge of Macintosh and hypertext.

3 units, Aut (Niemeyer)

174. Digital Art in Public Spaces—The relationship between digital art, public policy, and community action. Large-scale works are produced for installation in Bay Area public spaces using digital art media. Final project is a collaborative effort between student artists, community administrators, and the public involving issues of public concern, communication strategies, fundraising, and interacting with the press. For pre-enrollment, see http://www-leland.stanford.edu/dept/SUDAC. Prerequisites: 60 or 145, 70; working knowledge of Photoshop and Illustrator.

3 units, Spr (Niemeyer)

175. Motion Studies: An Introduction to Animation, Cartoon Physics, and Funny Walks—Hands-on animation, providing a foundation for future work in computer graphics, digital art, and animation. The techniques, tools, principles, and methods of traditional animation. Through lectures, hands-on exercises, motion analysis, and screenings, students learn a variety of animation techniques and gain a background of timing, spacing, weight, and expressive motion.

3 units, Aut (Loeb)

175A. The Virtual Object—Introduction to modeling, shading, and lighting in Maya, a high-end 3D modeling and animation application. Prerequisite: 173 and/or 175.

3 units, Win (Niemeyer)

175B. Digital Narrative Production—Third in a year-long sequence to produce full screen, multiple character, short animation.

3 units, Spr (Niemeyer)

176. The Illusion of Life—The analysis of visual and temporal perceptions of reality provides the basis for advanced modeling, shading, and lighting exercises for virtual 3D environments. For pre-enrollment, see http://www-leland.stanford.edu/dept/SUDAC.

3 units, Win (Dym)

200. The Work of Art and the Creation of Mind—(Enroll in Education 200.)

4 units, Win (Hannah, Rehm, Ross, Sano)

246. Individual Work: Drawing and Painting—Prerequisites: at least two quarters of painting or drawing and consent of instructor.

Aut, Win, Spr (Staff)

248. Advanced Monotype—Continuation of monotype, dealing with advanced technical and aesthetic problems in the medium. Prerequisite: 148.

3 or more units (Chagoya)

249. Advanced Undergraduate Seminar—Interdisciplinary concepts, engaging in collaborative projects using a variety of materials and techniques. This capstone experience for the major and minor in Art involves an exhibition open to the public or a final project review to which visiting critics may be invited. Taught by visiting artists.

3 units, Win, Spr (Staff)

250. Individual Work: Sculpture

any quarter (Randell)

260. Individual Work: Design

any quarter (Kahn)
268. Design Synthesis—Mature semi-elective problems in composite and multi-media design areas. Prerequisites: any two design courses above 160.
4 or more units (Kahn) not given 2000-01

269. Advanced Creative Studies—Seminar based on elective design projects in areas of individual specialization. Prerequisite: consent of instructor.
3 or more units, Aut, Win (Kahn)

270. Photography III—Student continues with own work, showing it in weekly seminar critiques.
Aut, Win, Spr (Leivick, Staff)

271. The View Camera, Its Uses and Techniques—Designed for serious students of photography who wish to gain greater control and refine skills in image-making. 4 x 5 view cameras are provided. Enrollment limited to 8.
3 units, Aut, Win, Spr (Leivick, Staff)

272. Individual Work: Photography—Student continues with own work, showing it in weekly seminar critiques.
any quarter (Leivick, Staff)

273. Individual Work: Digital Media
any quarter (Niemeyer)

310A,B,C. Directed Reading: Studio
3 units, any quarter (Staff)

342. Master’s Project—Two weekly seminars and studio practice (individual tutorial). The Object Seminar is a forum in which student work is critiqued on issues of identity, presentation, and the development of coherent critical language. The Concept Seminar explores various modes of conceptualization to broaden the base of cognitive and generative processes. Readings, discussions, writing.
any quarter (Staff)

360A,B,C. Master’s Project (Seminar): Design
Aut, Win Spr (Kahn)

AFFILIATED DEPARTMENT OFFERINGS

See respective department listings for course descriptions and General Education Requirements (GER) information.

GERMAN

128. The Beauty of Evil: Art and Morality in German Modernism

167N. Stanford Introductory Seminar: German Film to 1945

181A. The Aesthetics of Perception

MECHANICAL ENGINEERING

101. Visual Thinking

SLAVIC LANGUAGES AND LITERATURES

154/254. History of Russian Theater

152/252. Russian Modernist Theater: Naturalism, Expressionism, Symbolism, and Futurism

133A/233A. Deviation from Dogmas: Film in East Europe from 1956 to 1968

OVERSEAS STUDIES

The following courses are approved for the Art and Art History majors and taught overseas at the campus indicated below. Students should discuss with their major advisers on campus which courses would best meet their educational needs. Course descriptions can be found in the "Overseas Section" section of this bulletin or in the Overseas Studies Program office, 126 Sweet Hall.

BERLIN

110Y. Architecture and the City, 1871-1990: Berlin as Nucleus of Modernity—(Same as Overseas Studies 143U.)
4 units, Spr (Neckenig)

141Y. The Industrial Revolution and its Impact on Art, Architecture, and Theory—(Same as Overseas Studies 117V.)
5 units, Aut (Neckenig)

FLORENCE

111Y. From Giotto to Michelangelo: Introduction to the Renaissance in Florence
4 units, Win (Verdon)

115Y. The Duomo and Palazzo della Signora: Symbols of a Civilization
4 units, Aut (Verdon)

OXFORD

152Y. Museums, History, and Culture
4 units, Aut (J. Corn, W. Corn)

PARIS

123Y. French Painting from 1780-1900
4-5 units, Win (Halevi)

PUEBLA

190Y. Popular Mexican Art
4 units, Win (Staff)

ASIAN LANGUAGES

Emeriti: (Professors) Albert E. Dien, David S. Nivison, Makoto Ueda;
(Associate Professors) William A. Lyell*, Susan Matisoff
Chair: Chao Fen Sun
Professor: John C. Y. Wang (on leave)
Associate Professors: Thomas W. Hare (Asian Languages, Comparative Literature), Yoshiko Matsumoto, Haun Saussy (Asian Languages, Comparative Literature; on leave), Chaofen Sun
Assistant Professors: Wan Liu, James Reichert, Deborah Tze-lian Sang
Senior Lecturers: Kazuko M. Busbin, Kimie N. Nebrig
Lecturers: Fumiko Arao, Shelly W. Chan, Marina Chung, Keiko Fukuma, Grace Li, Hisayo O. Lipton, Momoyo K. Lowdermilk, Aki Mori, Yu-hua Rozelle, Xiao Yu, Hong Zeng, Qi Zhu
Acting Assistant Professor: John Wallace
Visiting Assistant Professor: David Schaberg

Chinese-Japanese Language and Area Studies Faculty:
Professors: Masahiko Aoki (Economics), Peter Duus (History), Harold L. Kahn (History, emeritus), Lawrence Lau (Economics), John W. Lewis (Political Science, emeritus), Jeffrey Mass (History), Daniel I. Okimoto (Political Science), Jean Oi (Political Science), Thomas P. Rohlen (Education), Andrew Walder (Sociology), John C. Y. Wang (Asian Languages), Arthur P. Wolf (Anthropological Sciences), Lee H. Yearley (Religious Studies)
Associate Professors: Carl W. Bielefeldt (Religious Studies); Bernard Faure (Religious Studies), Thomas W. Hare (Asian Languages, Comparative Literature), William A. Lyell (Asian Languages), Yoshiko Matsumoto (Asian Languages), David Palumbo-Liu (Comparative Literature), Haun Saussy (Asian Languages, Comparative Literature), Peter Sells (Linguistics), Chaofen Sun (Asian Languages) Melinda Takeuchi (Art and Art History), Richard Vinograd (Art and Art History)

* Active in the U.S.
Assistant Professors: Wan Liu (Asian Languages), Ellen Neskar (History), James Reichert (Asian Languages)

Senior Lecturers (Asian Languages): Kazuko M. Busbin, Kimie N. Nebri

Lecturer: Hill Gates (Anthropological Sciences)

Recalled to active duty.

The Department of Asian Languages offers courses in the languages, linguistics, cultures, and literatures of China, Japan, and Korea. The department accepts candidates for the degrees of Bachelor of Arts, Master of Arts, and Doctor of Philosophy in Chinese or Japanese. It also offers an undergraduate and a Ph.D. minor in Chinese or Japanese language and literature.

For information concerning other opportunities for study in the Asian field, see listings under the following departments and programs: Anthropological Sciences, Art and Art History, Business, Comparative Literature, East Asian Studies, Economics, History, Interdisciplinary Studies in Humanities, Law, Linguistics, Philosophy, Political Science, Religious Studies, and Sociology. Students interested in Asian languages not listed should contact the Special Language Program, Language Center.

UNDERGRADUATE PROGRAMS

BACHELOR OF ARTS

The A.B. degree is granted both in Chinese and in Japanese. The following courses and their prerequisites must be completed with a grade point average (GPA) of 'C' or better:

1. Concentrations in Chinese: Asian Languages 91 and 92, Chinese 207, Asian Languages 131, 132, 133, and four other content courses dealing with China primarily at the 100 level, as approved by the undergraduate adviser. Asian Languages 133 is the required Writing in the Major (WIM) course.

2. Concentrations in Japanese: Asian Languages 91 and 92, Japanese 103, and seven other content courses dealing primarily with Japan at the 100 level, as approved by the undergraduate adviser. At least two of these courses must be selected from the sequence 135, 136, 137, 138. Asian Languages 138 is the required WIM course. Asian Languages 51/151 and Japanese 30/130 are not counted toward the major.

These requirements are in addition to the University's basic requirement for the bachelor's degree. Letter grades are mandatory for all required courses.

MINORS

The undergraduate minor in Asian Languages has been designed to give students majoring in other departments an opportunity to gain a substantial introduction to Chinese (Mandarin) or Japanese language, as well as an introduction to the culture and civilization of East Asia. The minor consists of:

1. Completion of one year of language study at the second-year level (that is, Chinese 21, 22, 23 or Japanese 21, 22, 23) for students with no previous training in Chinese or Japanese. Students who already have first-year competence in Chinese or Japanese must complete the third-year course (Chinese 101, 102, 103 or Japanese 101, 102, 103) before undertaking any training in the Department of Asian Languages. Students who already have a competence at the second-year level may fulfill the language component of the minor by taking three courses in the department using materials in either Chinese or Japanese. These courses may be language courses such as the third-year sequence mentioned above, or they may be advanced literature and linguistics courses, depending on the capabilities and interests of the student in question.

2. The core courses, Asian Languages 91 (Traditional East Asian Civilization: China), and Asian Languages 92 (Traditional East Asian Civilization: Japan).

3. Two courses selected from among the department's other offerings in the literature, linguistics, and civilization of a given minor area. All courses for the minor must be completed with a GPA of 'C' or better.

HONORS PROGRAM

Majors with an overall GPA of 3.5 may apply for the honors program by submitting a senior thesis proposal to the honors committee during Winter or Spring Quarter of the junior year. The proposal must include a thesis outline, a list of all relevant courses the student has taken or plans to take, a skeleton reading list including a work or works in Chinese or Japanese, and the name of a faculty member who has agreed to act as honor's supervisor.

If the proposal is approved, research and writing begins in the Spring Quarter of the junior year, and for the first two quarters takes the form of directed reading with the chosen supervisor; the finished essay (normally about 15,000 words) is submitted to the committee no later than the end of the Winter Quarter in the senior year. From 10 to 15 units of credit are granted for the finished thesis.

COTERMINAL PROGRAMS

With department approval, students may be able to combine programs for the A.B. and A.M. degrees in Chinese or Japanese. For details, see the "Graduate Degrees" section of this bulletin.

EAST ASIAN STUDIES THEME HOUSE

EAST House, located at Governor's Corner on campus, is an undergraduate residence that houses 60 students and offers them a wide variety of opportunities to expand their knowledge, understanding, and appreciation of East Asia. Assignment is made through the regular undergraduate housing draw.

SUMMER PROGRAM

A nine-week summer program of intensive instruction is offered, on three different levels, in both Chinese and Japanese. The intensive courses provide the equivalent in instruction to regular academic-year courses. (See courses Chinese 5, 25, 105 and Japanese 5, 25, 105, and 114 as described below.) For detailed information about these and other aspects of the summer program, inquire at the Department of Asian Languages.

GRADUATE PROGRAMS

Admission—All students contemplating application for admission to graduate study must have a creditable undergraduate record. The applicant need not have majored in Chinese or Japanese as an undergraduate, but must have had the equivalent of at least three years of training in the language in which he or she intends to specialize, and must also demonstrate a command of English adequate for the pursuit of graduate study. Applicants should not wish merely to acquire or improve language skills, but to pursue study in one of the following fields: Chinese history (premodern), Chinese linguistics, Chinese literature, Chinese philosophy, Japanese cultural history, Japanese literature, and Japanese linguistics.

MASTER OF ARTS

The A.M. is granted in Chinese and in Japanese. The normal length of study for the degree is two years.

Applicants who wish to obtain only the A.M. and who do not intend to proceed to the Ph.D. are considered only if no financial aid is requested. Students who wish to spend the first year of graduate study at the Taipei or Yokohama centers must obtain department approval first. Candidates for the degree must be in residence at Stanford in California during the final quarter of registration.

A thesis or an annotated translation of a text of suitable literary or historical worth is required for the A.M. degree. Under special circumstances, a paper approved by the graduate adviser may be substituted.

The University's basic requirements for the master's degree, including a 36-unit minimum requirement, are given in the "Graduate Degrees" section of this bulletin. Department requirements are set forth below.

CHINESE

The candidate must:

1. Meet the department's requirements for the A.B. in Chinese or their equivalent.
2. Complete the following course work: 103, 201, 221, 222, 223, 299; four courses in Chinese numbered between 230 and 292; and two upper-division or graduate-level courses in fields such as Chinese anthropology, art, history, philosophy, and politics as approved by the graduate adviser in consultation with the student’s individual adviser. Students may be exempted from 101, 102, 103, and 221, 222, 223 by passing examinations to demonstrate that they have attained equivalent language competence. Letter grades are mandatory for all required courses and their prerequisites.

JAPANESE

The candidate must:

1. Meet the department’s requirements for the A.B. in Japanese or their equivalent.
2. Complete the following course work: 201, 211-213, 246, 247, 248, 299; four courses in Japanese numbered between 256 and 298; one course in literary theory or methodology at the 100 level or higher; and two courses in such fields as Japanese anthropology, art, history, politics, and religion, as approved by the graduate adviser in consultation with the student’s individual adviser. Students may be exempted from 211, 212, 213, and 246 by passing examinations to demonstrate that they have attained equivalent language competence. Letter grades are mandatory for all required courses and their prerequisites.

DOCTOR OF PHILOSOPHY

The Ph.D. degree is granted in Chinese and Japanese. Candidates for the degree are expected to acquire a thorough familiarity with Chinese or Japanese literature, an adequate command of both languages, and a comprehensive knowledge of East Asian history, social institutions, and thought. The University’s basic requirements for the Ph.D. are given in the “Graduate Degrees” section of this bulletin. Department requirements are set forth below.

ADMISSION TO CANDIDACY

Students admitted with an A.B. only are evaluated by the graduate faculty during the Autumn Quarter of their second year at Stanford. The evaluation is based on written work and at least a portion of the A.M. thesis or translation. If the faculty have serious doubts about a student’s ability to work for the Ph.D., they will convey this to the student. During the subsequent Spring Quarter, the faculty formally decides whether a student should be admitted to candidacy for the Ph.D. or be terminated. In the case of a student who already has an A.M. in Chinese or Japanese when admitted to the department, the evaluation takes place in the Spring Quarter of the student’s first year. If a student goes to the Taipei or Yokohama centers during his or her first two years, the department will consider an extension for admission to candidacy. The timing of the evaluation of a student admitted with an A.M. in East Asian Studies is decided on an individual basis.

Admission to candidacy does not mean that the student has fulfilled all requirements for the degree except the dissertation, but that the department faculty consider the student qualified to pursue a program of study leading to the Ph.D. and that, subject to continued satisfactory progress, the student’s status in this department is secure.

REQUIREMENTS

A candidate must fulfill the following requirements:

1. Demonstrate a reading knowledge of French, German, or another European language approved by the graduate adviser.
2. Complete two seminars at the 300 level. These seminars must be in different subjects.
3. Pass an examination in the supporting Asian language. A candidate whose field is Chinese is examined on his or her ability to read modern Chinese works relevant to his or her field of study. This requirement may be met by taking Chinese 101, 102, and 103 or 104 for letter grades. A candidate whose field is Japanese is examined on the ability to read classical Chinese works relevant to his or her field of study. This requirement may be met either by taking Chinese 205, 206, and 207 for letter grades.
4. Pass a set of four comprehensive written examinations, one of which tests the candidate’s methodological competence in a discipline. The remaining three fields are chosen, with the approval of the graduate adviser in consultation with the student’s individual adviser, from the following: anthropology, art, Chinese literature, history, Japanese literature, linguistics, philosophy, and religion.
5. Demonstrate pedagogical proficiency by serving as a teaching assistant for a minimum of one quarter, and taking Chinese, Japanese, or Korean 208 (Teaching Asian Languages).

University Oral Examination—General regulations governing the oral examination are found in the “Graduate Degrees” section of this bulletin. The candidate is examined on questions related to the dissertation, after acceptable parts of it have been completed in draft form.

Dissertation—The candidate must write a dissertation demonstrating ability to undertake original research based on primary materials in Chinese or Japanese.

Ph.D. MINOR

A student taking a minor in Asian Languages must complete at least 30 units of work within the department at the 200 and 300 level, chosen in consultation with a department adviser. The student must elect either Chinese or Japanese 201 unless the department is satisfied that work done elsewhere has provided similar training. The student must also pass a written examination in the Chinese or Japanese language.

STUDYING ABROAD

Students interested in a serious study of Japanese language, history, culture, and social organization are encouraged to apply to the Kyoto Center for Japanese Studies (KCJS), a September-to-April program managed by Stanford and including students from other American universities. Students with two years of Japanese may attend the full academic year, or Autumn or Spring semester only. In Spring Quarter, the Stanford Center for Technology and Innovation (SCTI), also in Kyoto, focuses on Japanese organizations and the political economy of research, development, and production of high technology and advanced industries, followed by a two-to-three-month internship in an agency, firm, or laboratory in Japan. For students in a technical major, two quarters of Modern Japanese or Japanese Language, Culture, and Communication B (5 units), or five quarters of Japanese Language, Culture and Communication A (3 units) fulfill the SCTI language requirement; for students in a non-technical major, five quarters of Japanese Language, Culture, and Communication B (5 units) fulfill the SCTI language requirement. For information about either program in Kyoto, students should contact the Overseas Studies office in Sweet Hall.

Students should take note of the programs of the Inter-University Board for Chinese Language Studies and the Inter-University Center for Japanese Studies located in Yokohama. Stanford is a member of these consortia programs. See “The Institute for International Studies” section in this bulletin.

Attention is also called to the exchange program established with the Department of Chinese at Peking University in Beijing. Those interested in the program should consult the chair of the department early in the academic year.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirement.

Since unavoidable changes occasionally have to be made in course offerings after the Stanford Bulletin has gone to print, students are advised to consult the department each quarter.

GENERAL

These courses are open to all undergraduate and graduate students, are taught in English, and do not require a knowledge of an Asian language.

51/151. Japanese Business Culture—Japanese group dynamics in industrial and corporate structures, negotiating styles, decision making,
and crisis management. Emphasis is on strategies to manage intercultural differences.

3 units, Win (Dasher)

71N. Stanford Introductory Seminar: Language and Gender in Japan—Myths and Reality—Preference to freshmen. The social position of women in Japan is believed to be reflected in a characteristically feminine form of the language. The past and present speech styles of women, linguistic ideology, class, generation differences, and identity in Japan. How belief and reality are refracted through mass media and fictional representations. Comparisons with male speech styles and with similar phenomena in other cultures. GER:3a,4c (DR:7)

3 units, Win (Matsumoto)

73/173. Chinese Language, Culture, and Society—Introduction to important functions of the language in Chinese culture and society. Topics: the origin of the language, developments of dialects, emergence of the standard, evolution of Chinese writing, language policies in Greater China, language and gender, formulaic expressions preferred in Chinese, etc. Recommended: one quarter of Chinese 1 or 1B, or equivalent. GER:3a,4a (DR:2 or 7)

4 units (Sun) not given 2000-01

75A. Visible Bodies, Unseen Bodies—Body and Ethics in Japanese Films—Innovative Japanese films, 1950s through the 90s. An examination of each filmmaker’s style and technique asks how ethics are implicated in the presentation of the body (e.g., bodies of women, athletes, criminals, etc.) and how visible and hidden dimensions of cinematic meaning subvert that initial interpretation.

4 units, Aut (Kage)

78. New Chinese Cinema—Introduction to the artistic films of contemporary mainland China, Taiwan, and Hong Kong. How the anxieties of culture are mediated through film. The issue of individual style. Film as ethnography, revisionist history, fantasy, and sculpting in time. GER:3a (DR:7)

4 units, not given 2000-01

78A. Chinese Cinema: The Fifth Generation—The works of a group of Chinese directors who became known in the early 1980s, explored through a chronological presentation of 16 major films and thematic discussions (narrative and non-narrative forms, symbolism, individuality, idiosyncrasy, satire, gender relations). Each film is contextualized within the literary and historical traditions of China. Films shown with English subtitles; readings in English, with optional readings distributed in Chinese.

4 units, Aut (Chou)

91. Traditional East Asian Civilization: China—Introduction to Chinese culture in a historical context. GER:3a,4a (DR:2 or 7)

5 units, Aut (Liu)

92. Traditional East Asian Civilization: Japan—Perspectives on Japan’s traditional civilization, focusing on the literature, religion, history, music, and visual arts of Japan’s medieval period (approximately 1200 to 1600 A.D.). The historical context from which the medieval period emerged, and some of the social and intellectual contributions it made to the development of modern Japan. The focus is on the society of samurai, priests, actors, and poets which created the rich culture of Japan’s middle ages. GER:3a,4a (DR:2 or 7)

5 units, Win (Hare)

95. The Japanese Language in Culture and Society—Introduction to the essentials of how the language functions in Japanese society and culture; salient characteristics are contrasted with English. Topics: politeness rules, conversational strategies, language and gender, formulaic expressions, and factors that make certain linguistic forms preferred in Japanese. Recommended: one quarter of Japanese 1 or equivalent, GER:3a (DR:7)

4 units (Matsumoto) not given 2000-01

98A. Desire and Modern Chinese Literature—The place of desire in 20th-century Chinese literature, focusing on the intertwined relationship between desire and, e.g., nationalism, nativism, modernity, and accelerated globalization. 98A deals with May Fourth authors (e.g., Ding Ling, Yu Dafu, Shen Congwen) and Mandarin Ducks and Butterflies (fiction; 98B looks at groundbreaking authors in the 1980s and ’90s. Recommended: knowledge of Chinese.

98A. 4 units (Sang) not given 2000-01

98B. 4 units (Sang) not given 2000-01

114. Haiku—Japanese haika from the 16th century to the present. Works of Basho, Buson, Issa, and other representative poets in English translation. Students exchange their readings of individual poems in class, learning how others have filled in the blanks in the text. Aspects of traditional Japanese aesthetics.

3 units (Staff) not given 2000-01

115. History of Japanese Popular Culture—Overview of current and historical trends in Japanese popular culture focusing on, e.g., puppet plays, woodblock prints, detective novels, theatrical reviews, comic books, and animated films. Emphasis is on how individual cultural products operate in conjunction with contemporaneous networks of social, technological, economic, and political signification. GER:4a (DR:2)

4 units, Spr (Reichert)

131/231. Chinese Poetry in Translation—The Chinese poetic tradition from the first millennium B.C. to the 14th century. Traditional verse forms representative of the classical tradition; highlights of the most distinguished poets. Topics on the history, language, and culture relevant to the literary works under study. GER:3a,4a (DR:2 or 7)

4 units, Win (Liu)

132/232. Chinese Fiction and Drama in Translation—Fiction and drama from early times to the 18th century, emphasizing literary and thematic discussions of major representative works available in English translation. GER:3a,4a (DR:2 or 7)

4 units, Spr (Schaberg)

133/233. Modern and Contemporary Chinese Literature in Translation—Required for Chinese majors. Readings in representative 20th-century works of fiction, drama, and poetry. GER:3a,4a (DR:2 or 9) (WIM)

4 units, Win (Lyell)

133A/233A. Introduction to Modern Chinese Literature—Developments in literature and literary theory in 20th-century China. The May Fourth Period, Mandarin Ducks and Butterfly urban popular fiction, the socialist realism era beginning in the 1930s and extending through the Yan’an days in the ’40s, the Cultural Revolution, and the rapidly changing literary forms of post-Mao society. Readings in English.

4 units (Sang) not given 2000-01

135/235. Classic Japanese Drama—The development of drama from early religious ritual forms through noh, puppet theater, and kabuki. Plays are analyzed as dramatic literature and in terms of performance. Texts are in English translation. Video tapes supplement lectures. GER:3a,4a (DR:2 or 7)

4 units, Aut (Hare)

4 units, Spr (Wallace)
137/237. Classical Japanese Fiction in Translation—Introduction to major works of prose narrative from premodern Japan (7th through mid-19th centuries) read in English translation, and emphasizing the historical, intellectual, and cultural context in which they were written. Works vary each year; may be repeated for credit with instructor's consent.
4 units (Staff) not given 2000-01

138/238. Modern Japanese Literature in Translation—Required for Japanese majors. Introduction to Japanese literature since 1868. Authors: Futabatei Shimei, Higuchi Ichiyo, Natsume Soseki, Yoshimoto Banana, etc. GER:3a, 4a (DR:2 or 7) (WIM)
Futabatei Shimei, Higuchi Ichiyo, Soseki, Tanizaki, and Mishima. GER:3a,4c (DR:7f)

141. Chinese Mythology and Lyrical Imagination—Introduction to Chinese mythology. The mythic narratives about Chinese ancestry, legendary dynasties, natural deities, and divine heroes in Chinese culture, and the dissemination of myths in poetry that reenact earlier legendary dynasties, natural deities, and divine heroes in Chinese culture. Approach is eclectic, incorporating Chinese and Western perspectives and drawing on theories of sinologists and general mythologists. GER:3a (DR:7 or 8)
4 units (Li) not given 2000-01

168. Introduction to Asian American Culture—(Enroll in Comparative Literature 168.)
5 units, Win (Palumbo-Liu)

181. Japanese Women Writers—Works in translation by women novelists and poets from the Meiji period to the present. Focus is on women's response to their marginal role in Japanese society and the literary establishment.
4 units (Staff) not given 2000-01

187/287. Romance, Desire, and Sexuality in Modern Japanese Literature—Constructions of romance, desire, and sexuality (sexual consciousness, love suicide, nanoshuku, etc.) in Edo Japan and how these paradigms are reconfigured by modern writers. Readings: Saikaku, Chikamatsu, Chiyo, Soseki, Tanizaki, and Mishima. GER:3a,4c (DR:71)
4 units (Reichert) not given 2000-01

200. Directed Reading—By instructor's assignment. For both Chinese and Japanese literatures.
units by arrangement, Aut, Win, Spr (Staff)

273. The Postmodern Pacific—(Enroll in Comparative Literature 273.)
5 units (Palumbo-Liu) not given 2000-01

372. Literary Theory and the Necessary Fiction of Asia—Examination of effective multiculturalism (fantasy, misunderstanding, exaggeration, projection, and mirror effects) in the theories about literature and culture. The enabling role of a hypothetical ‘other’ culture, integrating the lessons into our practice as students of Asia. Readings from Hegel, Nietzsche, Segalen, Pound, Husserl, Corbin, Heidegger, Poucalt, Derrida, de Man, Goetz, Said, Kristeva, Clifford, etc.
5 units (Saussy) not given 2000-01

CHINESE
FIRST- AND SECOND-YEAR LANGUAGE

Note—Students registering for the first time in a first- or second-year course must take a placement test if they have had any training in Chinese before entering Stanford. All entering students must take Part I (written) of the placement test on-line during the summer, followed by Part II (oral), to be administered on campus 9/26/00. Consult the Stanford Language Center for further information or see the web site.

1,2,3. First-Year Modern Chinese—Conversation, grammar, reading, elementary composition. Daily sections may be set at the beginning of the quarter to suit schedule requirements.
1. 5 units, Aut (Leung, Zeng, Staff)
2. 5 units, Win (Leung, Zeng, Staff)
3. 5 units, Spr (Leung, Zeng, Staff)

1B,2B,3B. First-Year Modern Chinese for Bilingual Students—For students with elementary comprehension and speaking skills. Provides a basic knowledge of modern Chinese literature and culture, improving conversation and grammar.
1B. 3 units, Aut (Rozelle, Chu)
2B. 3 units, Win (Rozelle, Chu)
3B. 3 units, Spr (Rozelle, Chu)

5. Intensive First-Year Modern Chinese—Equivalent to 1, 2, and 3 combined. Five weeks at Stanford and four weeks at Peking University.
8 units, Sum (Staff)

6,7,8. Beginning Conversational Chinese—Three-quarter sequence equips students with basic language skills in Mandarin to function abroad.
2 units, Aut, Win, Spr (Rozelle, Yu)

10,11,12. Beginning Southern Min (Taiwanese) Conversation
2 units, Aut, Win, Spr (Lin)

15,16,17. Beginning Cantonese Conversation—Three-quarter sequence designed to equip students with the basic language skills needed in everyday life situations.
2 units, Aut, Win, Spr (Leung)

21,22,23. Second-Year Modern Chinese—Further study in grammar, conversation, composition. Prerequisite: 3 or equivalent.
21. 5 units, Aut (Chung, Staff)
22. 5 units, Win (Chung, Staff)
23. 5 units, Spr (Chung, Staff)

21B,22B,23B. Second-Year Modern Chinese for Bilingual Students—For students with advanced comprehension and speaking skills, but lacking equivalent knowledge of grammar, reading, and writing Chinese characters. Equivalent to 21, 22, 23.
21B. 3 units, Aut (Zhu)
22B. 3 units, Win (Zhu)
23B. 3 units, Spr (Zhu)

25. Intensive Second-Year Modern Chinese—Equivalent to 21, 22, 23 combined. Five weeks at Stanford and four weeks at Peking University. Prerequisite: 3 or equivalent.
8 units, Sum (Staff)

27,28,29. Intermediate Chinese Conversation—Prerequisite: 3 or consent of instructor.
27. 2 units, Aut (Wu)
28. 2 units, Win (Wu)
29. 2 units, Spr (Wu)

51. Chinese Calligraphy—Practice in writing Chinese characters with a brush and learning different scripts. Limited enrollment. May be repeated for credit. Prerequisite: 3 or equivalent. (AU)
1-2 units, Win, Spr (Chuang)

99. Language Specials—With consent of department only. See instructor for section number.
1-3 units, Aut, Win, Spr (Staff)

ADVANCED
101,102,103. Third-Year Modern Chinese—Designed to help students solidify and further their communicative ability in Chinese through contact with various written and spoken styles of modern Chinese. Reading and discussion of authentic writings on cultural topics; newspaper reports,
radio, and TV broadcasts and films; on-line Chinese software and e-mail network to facilitate study. Prerequisite: 23 or equivalent.

5 units, Aut, Win, Spr (Chu)

101B,102B,103B. Third-Year Modern Chinese for Bilingual Students—For students with advanced listening and speaking abilities, but lacking equivalent knowledge in reading and writing. Equivalent of 101, 102, 103.

3 units, Aut, Win, Spr (Chu)

105. Intensive Modern Chinese—Equivalent to 101, 102, 103 combined. Five weeks at Stanford and four weeks at Peking University. Prerequisite: 23 or equivalent.

8 units, Sum (Staff)

121,122,123. Advanced Chinese Conversation—Prerequisite: 23 or equivalent.

121. 2 units, Aut (Chung)
122. 2 units, Win (Chung)
123. 2 units, Spr (Chung)

125,126,127. Beginning Classical Chinese—For students who need to develop a reading knowledge of Classical Chinese and have completed at least two years of Modern Chinese, or its equivalent. Students who have no background in Classical Chinese and are taking 127 to satisfy Chinese major requirements must begin with 125. Introduces basic grammar and commonly used vocabulary of classical Chinese. Prerequisite: 23 or equivalent.

125. 5 units, Aut (Sun)
126. 5 units, Win (Sun)
127. 5 units, Spr (Staff)

131,132,133. Business Chinese—Chinese for doing business (specialized vocabulary on commercial, economic, and business-related subjects). Materials include a text of formal conversations of typical business transactions, newspaper and journal articles, and TV news broadcasts on foreign trade and economic development in the world. Students achieve a familiarization with the technical language and business etiquette, and report in spoken and written Chinese based on their own research regarding recent economic developments, using sources in Chinese. Prerequisite: 23 or equivalent.

131. 3-4 units, Aut (Yu)
132. 3-4 units, Win (Yu)
133. 3-4 units, Spr (Yu)

191/291. The Structure of Modern Chinese—Designed to help students, who have had one year or more of modern Chinese, develop a sophisticated knowledge of Chinese grammar. Introduction to the grammatical structure of Chinese, focusing on syntax and semantics. Prerequisite: 3 or equivalent, or consent of instructor.

4 units, Spr (Sun)

192. The History of Chinese—Historical changes in the Chinese language in the last 2,000 years, emphasizing syntactic and semantic changes, and grammaticalization. Students use a computer corpus to do research on the history of Chinese. Prerequisite: 206 or consent of instructor.

4 units (Sun) not given 2000-01

193. Chinese Narratives of War and Honor—The origins in premodern history, fiction, and drama of one popular contemporary genre, the martial arts novel. Focus is on the varieties of heroic action, games with gender, visions of justice, and the continuity of these themes. Reading selections from Zuoqiu, Shiji, Shishuo xinyu, Tang wonder tales and transformation tales, Song and Ming loyalist tales, Yuan variety plays, Sanguoyanyi, and Shuihu Zhuan. Prerequisite: reading ability in Chinese.

4 units, Spr (Schaberg)

199. Individual Reading in Chinese—Asian Languages majors only. Prerequisite: 103 or consent of instructor.

4 units, Aut, Win, Spr (Staff)

GRADUATE

200. Directed Reading in Chinese—Prerequisite: 213 or 223, or consent of instructor.

units by arrangement, Aut, Win, Spr (Staff)

19. Proseminar—Introduction to the research tools and sources relevant to Chinese humanistic studies, taught as a workshop with participation by faculty from various departments. Prerequisite: knowledge of classical Chinese.

5 units (Sauvy, Staff) not given 2000-01

205,206,207.—For graduate students; see 125, 126, 127.

205. 5 units, Aut (Sun)
206. 5 units, Win (Sun)
207. 5 units, Spr (Sun)

208. Teaching Asian Languages—Lectures on teaching methods, class visits, and in-class teaching exercises prepare students for a career in teaching. May be repeated for credit. Pass/no credit only. Prerequisite: consent of mentor teacher.

2 units, Win (Sun)

211,212,213. Advanced Modern Chinese—For advanced learners, including those with overseas experience. Year-long sequence helps students become functional speakers, readers, and writers of modern Chinese through articles and essays from newspapers, magazines, scholarly journals, and the internet. Classes alternate between focus on cultural themes and on social science material; students may take both for 5 units or one part for reduced units. Prerequisite: minimum three years of Chinese language.

211. 5 units, Aut (Zhu)
212. 5 units, Win (Zhu)
213. 5 units, Spr (Zhu)

214. Introduction to Modern Chinese Literature I—Introduction to modern and contemporary Chinese literature (short stories, novels, plays, and poetry) through annotated texts. Students discuss materials in Chinese during class. Prerequisite: three years of modern Chinese.

5 units (Lyell) not given 2000-01

215. Introduction to Modern Chinese Literature II—Continuation of 214. Prerequisite: advanced Chinese.

5 units (Lyell) not given 2000-01

221,222,223. Advanced Classical Chinese—Prerequisite: 207 or equivalent.

221. Philosophical Texts
5 units, Aut (Sahleen)

222. Historical Narration
5 units (J. Wang) not given 2000-01

223. Literary Essays—Prerequisite: basic classical Chinese.

5 units, Win (Liu)

241. The Short Story—Prerequisite: three or four years of Chinese.

5 units (Lyell) not given 2000-01

242. Essay
5 units (Staff) not given 2000-01

243. The Novel
5 units (Lyell) not given 2000-01
244. Workshop in Translation—Students practice translating modern and contemporary Chinese works of literature into good English. Books and articles on the theory and practice of translation are required. Students use identical works and criticize and improve each other's work. Tool books are introduced and discussed. Prerequisite: advanced Chinese.

3-4 units, Win (Lyell)

251, 252, 253. Business Chinese—For graduate students; see 131, 132, 251, 252, 253.

251. 3-4 units, Aut (Yu)
252. 3-4 units, Win (Yu)
253. 3-4 units, Spr (Yu)

261. Sources of Chinese Poetry—Selections from the Book of Songs (c. 1000-500 B.C.) and the Songs of Ch’u (c. 400 B.C.), the two earliest anthologies of Chinese poetry.

4 units, Win (Schaberg)

262. Early Chinese Prose and Verse Genres—Readings from the 6th-century anthology Wen xuan, encompassing examples of the shi lyric, the fu rhapsody, critical essays, letters, deliberations, memorials, eulogies, etc. Focus is on the intrinsic interest of the texts and on the anthologists' reasons for singling them out as model compositions. Readings in classical Chinese. Prerequisite: 207 or consent of instructor.

4 units (Saussy) not given 2000-01

263. Lyric (shi) I—Selected readings in the early history of the lyric (shi), Han through Sui dynasties.

4 units (Liu) not given 2000-01

264. Lyric (shi) II—In-depth examination of T’ang poetry, focusing on major figures and forms.

4 units, Aut (Liu)

266. Chinese Tz’u Poetry (Song Lyrics)—Highlights from the Northern and Southern Sung periods. Patterns of generic development are correlated to social changes in historical context. Prerequisite: classical Chinese.

4 units (Liu) not given 2000-01

267. Methodologies in Approaching Modern and Contemporary Chinese Literature—Survey of the methodologies various scholars have employed in looking at, and writing about, modern and contemporary Chinese literature. Students are expected to write a reasoned summary of their own methodology.

5 units (Lyell) not given 2000-01

271, 272. Traditional Chinese Fiction—Selected readings in short stories and novels from early times to Ch’ing. Prerequisite: 127/207 or consent of instructor.

271. Short Stories
4 units (J. Wang) not given 2000-01
272. Novels
4 units (J. Wang) not given 2000-01

273. Chinese Drama—Selected readings in the dramatic works of the Yuan, Ming, and Ch’ing periods emphasizing literary, not theatrical qualities. Prerequisite: 207 or consent of instructor.

4 units (J. Wang) not given 2000-01

274. Apparitions of Women in Traditional Chinese Fiction—Selections from Lieni chuan (a Han Dynasty exemplar book), Sui Yangdi yanshi, Ni caizi shu, and Hong lou meng.

4 units (Saussy) not given 2000-01

286. Women Writers of Transnational China—Chinese women writers across national borders, focusing on contemporary novelists in Taiwan, Hong Kong, and the mainland. Their stylistic innovations and approaches to gender, culture, and national identities. The contours and boundaries of transnational China through the female imaginary. Writers: Wang Anyi, Lin Bai, Chen Ran, Zhu Tianxin, Li Ang, Chen Xue, Xi Xi, Anchee Min.

4 units (Saussy) not given 2000-01

291. The Structure of Modern Chinese—For graduate students; see 191.

4 units, Spr (Sun)

292. The History of Chinese—For graduate students; see 192.

4 units (Sun) not given 2000-01

299. Master’s Thesis or Translation—A total of 5 units taken in one or more quarters.

Aut, Win, Spr (Staff)

334. Seminar in Modern Chinese Literature—May be repeated for credit. Prerequisite: 243 or consent of instructor.

5 units (Lyell) not given 2000-01

371. Seminar in Chinese Literary Criticism—Readings/discussion of Chinese critical texts vis-a-vis relevant literary theories in the West. May be repeated for credit. Prerequisite: 127/207 or consent of instructor.

5 units (J. Wang) not given 2000-01

373. Seminar on the Tso-chuan—In-depth reading and study of the Tso-chuan as history and literature. Prerequisite: 127/207 or consent of instructor.

5 units (J. Wang) not given 2000-01

1-12 units, Aut, Win, Spr, Sum (Staff)

400. Advanced Language Training—Open only to students in the Inter-University Board for Chinese language programs in Beijing or Taipei. For more information, contact the consortium office at U.C. Berkeley (510) 642-3873.

1-15 units per quarter (Staff)

JAPANESE

FIRST- AND SECOND-YEAR LANGUAGE

Note—Students registering for the first time in a course must take a placement test if they have had any training in Japanese before entering Stanford. All entering students must take Part I (written) of the placement test on-line during the summer, followed by Part II (oral), to be administered on campus 9/26/00. Consult the Stanford Language Center for further information or see the web site.

1,2,3. First-Year Modern Japanese—Provides students with a solid foundation in grammar, conversation, reading, and basic composition (150 Kanji characters introduced).

1. 3 units, Aut (Busbin)
2. 5 units, Win (Busbin)
3. 5 units, Spr (Busbin)
5. Intensive First-Year Modern Japanese—Equivalent to 1, 2, and 3 combined.
   12 units, Sum (Staff)

7A/107A, 8A/108A, 9A/109A. First-Year Japanese Language, Culture, and Communication A—Strongly recommended for those interested in studying in Japan in a program such as SCTI. Focus is on the skills necessary to communicate successfully in Japanese, offering a practical means of acquiring a working knowledge of current Japanese. On-line listening exercises, audiovisual materials, and Kanji tutorials enhance students’ competence. At the completion of the course, students are able to talk, write, and read on topics such as personal history, experiences, familiar people, and places. Serves as the core course of the 5 units option of JLCC (7B/107B, 8B/108B, and 9B/109B). See http://www.stanford.edu/class/japanese/1fj7a.html.
   7A/107A. 3 units, Aut (Okano)
   8A/108A. 3 units, Win (Okano)
   9A/109A. 3 units, Spr (Okano)

7B/107B, 8B/108B, 9B/109B. First-Year Japanese Language, Culture, and Communication B—Strongly recommended for those interested in studying in Japan in a program such as SCTI. Enhances the students’ ability to use Japanese as a tool, building on language competence developed in 7A/107A, 8A/108A, 9A/109A. Two components focus on the cultural background necessary for successful communication, and on speaking and listening strategies for effective communication. See http://www.stanford.edu/class/japanese/1fj7b.html.
   7B/107B. 5 units, Aut (Okano, Shimizu, Mori)
   8B/108B. 5 units, Win (Okano, Shimizu, Mori)
   9B/109B. 5 units, Spr (Okano, Shimizu, Mori)

   17A/117A. 3 units, Win (Mori)
   18A/118A. 3 units, Win (Mori)
   19A/119A. 3 units, Spr (Mori)

   17B/117B. 5 units, Aut (Kubo, Shimizu)
   18B/118B. 5 units, Win (Kubo, Shimizu)
   19B/119B. 5 units, Spr (Kubo, Shimizu)

21,22,23. Second-Year Modern Japanese—Continuation of Japanese 3 (or 5). Students develop conversation and expression of ideas, master more advanced grammatical patterns, use 600 kanji, write simple compositions, and have an enhanced understanding of Japanese culture. At the completion of the sequence, students can read original source material. Prerequisite: 3 or equivalent.
   21. 5 units, Aut (Arao)
   22. 5 units, Win (Arao)
   23. 5 units, Spr (Arao)

25. Intensive Second-Year Modern Japanese—Equivalent to 21, 22, and 23 combined. Prerequisite: 3 or equivalent.
   12 units, Sum (Staff)

27,28,29. Intermediate Japanese Conversation—Develops oral proficiency (“survival level”) through the practice of simple sentence patterns, use of audiotapes, and oral presentations. Targeted for the practical use of Japanese. Prerequisite: 3 or consent of instructor.
   27. 2 units, Aut (Kuge)
   28. 2 units, Win (Nakamura)
   29. 2 units, Spr (Suzuki)

99. Language Specials—With consent of department only. See instructor for section number.
   1-5 units, Aut, Win, Spr (Staff)

101,102,103. Third-Year Modern Japanese—Third-year Japanese students move beyond acquisition of fundamental grammatical forms to reading and discussion of more complex material. Emphasis is on the accurate understanding of Japanese sentence structure in newspaper and journal articles; and readings from other genres (fiction, poetry, and essays). Polite language (keigo) skills and additional written and spoken patterns are mastered. Videos of everyday Japanese spoken at normal speed develop listening skills. Sequence course. Prerequisite: 23 or equivalent.
   101. 5 units, Aut (Arao)
   102. 5 units, Win (Arao)
   103. 5 units, Spr (Arao)

105. Intensive Third-Year Modern Japanese—Equivalent to 101, 102, and 103 combined. Prerequisite: 23 or equivalent.
   12 units, Sum (Staff)

111,112,113. Business Japanese—Conducted entirely in Japanese. Readings/discussions focus on business-related topics: cultural attitudes and approaches, work ethic, the stock market, import-export trade. Introduction to business letters, job interviews, and resume writing. May be repeated for credit. Prerequisite: 23 or 25 or consent of instructor.
   111. 3 units, Aut (Fukuma)
   112. 3 units, Win (Fukuma)
   113. 3 units, Spr (Fukuma)

114. Japanese for Business—Eight-week summer course designed to improve Japanese language skills as used in business circles in Japan. Focus is on cultural attitudes and approaches, the stock market, international trade, business letters, usage of honorific forms and expressions, telephone etiquette, etc. Entirely in Japanese. Prerequisite: 23 or equivalent.
   3 units, Sum (Staff)

121,122,123. Advanced Japanese Conversation—Creates “paragraph persons” with three focal points: fine tuning grammatical points, practice explaining things in Japanese, more fluency in speech. Use of audio/visual tapes, oral presentations, and discussions. Prerequisite: 23, 29, or consent of instructor.
   121. 2 units, Aut (Kubo)
   122. 2 units, Win (Kubo)
   123. 2 units, Spr (Kubo)

127A,128A,129A. Third-Year Japanese Language, Culture, and Communication A
   3 units, not given 2000-01

   127. 5 units, Aut (Shimizu)
   128. 5 units, Win (Shimizu)
   129. 5 units, Spr (Shimizu)
177/277. The Structure of Japanese—Linguistic analysis of the major grammatical structures of Japanese, focusing on their salient characteristics and functions. Prerequisites: two years of Japanese. Recommended: previous course in linguistics.

4 units, Aut (Matsumoto)

199. Individual Reading in Japanese—Asian Languages majors only. Prerequisite: 103 and consent of instructor.

4 units, Aut, Win, Spr (Staff)

GRADUATE

200. Directed Reading in Japanese—Prerequisite: 213 or equivalent. Prerequisite by arrangement. Aut, Win, Spr (Staff)

201. Proseminar—Bibliography and research methods in Japanese studies. Prerequisite: 103 or equivalent.

5 units (Staff) not given 2000-01

208. Teaching Asian Languages—Lectures on teaching methods, class visitations, and in-class teaching exercises prepare students for a career in teaching. May be repeated for credit. Prerequisite: consent of mentor teacher.

2 units, Win (Matsumoto)

211,212,213. Advanced Modern Japanese—Increase the ability to understand the structure of Japanese, become familiar with writings in different genres and styles, utilize such knowledge in writing, and discuss and express verbally questions and opinions on a variety of topics. Original writings, including fiction, essays, newspaper, and journal articles. Recommended taken in sequence. Prerequisite: 103 or equivalent.

211. 3-5 units, Aut (Matsumoto)
212. 3-5 units, Win (Kubo)
213. 3-5 units, Spr (Kubo)

246. Introduction to Classical Japanese—The basic principles of the classical literary language, concentrating on grammar and vocabulary. Prerequisite: 103 or equivalent.

5 units, Aut (Wallace)

247. 5 units, Win (Wallace)
248. 5 units, Spr (Reichert)

258. Japanese Buddhist Texts—(Enroll in Religious Studies 258.)

5 units, Spr (Bielefeldt)

4 units (Hare) not given 2000-01

280. Medieval Japanese Texts—Reading/discussion of selected works of the Kamakura and Muromachi periods. The problems of subjectivity in medieval texts in the writings of Shunzei, Dogen, Chomei, Zeami, and Ikkyu. Prerequisite: 247, 248 or equivalent.

4 units, Spr (Hare)

281. Japanese Pragmatics—Japanese language from the point of view of pragmatics, focusing on socio-cultural and discourse factors reflected in the choice of linguistic forms and their theoretical implications. Prerequisites: one year of Japanese, one course in linguistics or two years of Japanese, or consent of instructor.

4 units (Matsumoto) not given 2000-01

296. Readings in Modern Japanese Literature—Readings/discussion of works selected from contemporary authors. May be repeated for credit. Prerequisite: 213 or equivalent.

4 units, Aut (Reichert)

4 units (Staff) not given 2000-01

299. Master's Thesis or Translation—A total of 5 units, taken in one or more quarters.

Aut, Win, Spr (Staff)

330. Seminar in Heian Fiction—Advanced work in Heian fiction, concentrating on the function of poetry within fiction. Izumi Shikibu nikki is used as the base text to discuss how poems in rhetorical juxtaposition drive narrative development. Students complete a major paper. Prerequisite: 247 or 248.

5 units, Win (Wallace)

333. Seminar in Japanese Classical Drama—Advanced work in traditional dramatic forms, emphasizing the relation between text and performance in Noh, Joruri, and other performance narratives. Paper. Prerequisite: 247 or 248 or consent of instructor.

5 units (Hare) not given 2000-01

336. Seminar: Writing in Early Japan—Advanced work in the textualities of the 6th through mid-8th century Japan. Focus is on Man'yoshu, with attention to other early texts of literary, historical, and/or religious interest. Prerequisites: 246, and 247 or 248.

5 units (Hare) not given 2000-01

396. Seminar in Modern Japanese Literature—May be repeated for credit. Prerequisite: 213.

5 units, not given 2000-01

1-12 units, Aut, Win, Spr, Sum (Staff)

400. Advanced Language Training—Open only to students at the Yokohama Center. For more information, see the program description under the “Inter-University Center for Japanese Studies in Yokohama” section in this bulletin.

1-15 units per quarter (Staff)

KOREAN

1,2,3. First-Year Modern Korean—Elementary spoken and written Korean, equipping students with basic sentence patterns using basic vocabulary. Speaking, reading, writing, and listening comprehension with spoken language emphasized. Students develop the ability to say greetings, tell time, carry on limited conversation in classrooms, stores, and ask directions.

5 units, Aut, Win, Spr (Staff)

21,22,23. Second-Year Modern Korean—Intermediate spoken and written Korean, providing students with more complex sentences in advanced grammatical patterns, building on the grammatical structures taught and learned during first-year Korean. Students are expected to be competent in conversing on topics in daily life situations. Emphasis is on speaking, reading, writing, and listening comprehension. Students communicate at an intermediate level of topics in everyday life, read simple texts, and have a good knowledge of Korean culture.

5 units, Aut, Win, Spr (Staff)

101,102,103. Third-Year Modern Korean—Advanced spoken and written Korean. Develops communicative competence in reading, writ-
ing, speaking, and listening skills. Students build their vocabulary, heighten their reading ability, and strengthen aural/oral skills. Through weekly writing assignments, students learn about syntax, pragmatic ways of expression, and logical ways of thinking in Korean. Short story telling, free-group discussion, and acquaintance with Korean drama, movie, news, newspapers, and songs.

3 units, Aut, Win, Spr (Staff)

171/271. The Structure of Korean—Introduction to modern Korean linguistics, focusing on history, phonology and morphology, syntax and semantics, socio- and psycho-linguistics, pragmatics, language acquisition and pedagogy. Prerequisite: 3 or equivalent, or consent of instructor.

4 units, not given 2000-01

200. Directed Reading in Korean—Develops advanced reading and writing skills in modern Korean for future academic work. One discussion weekly, focusing on Korean linguistics; literature, culture, and history; economy and politics; Korean multimedia (CD-ROM and software); newspapers, magazines; Sino-Korean characters; or Korean conversation. Prerequisite: 103 or consent of instructor.

3 units by arrangement, Aut, Win, Spr (Staff)

208. Teaching Asian Languages—Lectures on teaching methods, class visitations, and in-class teaching exercises. Prepares students for a career in teaching. May be repeated for credit. Prerequisite: consent of instructor.

2 units, Win (Staff)

ASTRONOMY COURSE PROGRAM

Emeriti: (Professors) Ronald N. Bracewell, Von R. Eshleman, John R. Spreiter, Peter A. Sturnick
Committee in Charge: (Director) Vahé Petrosian; Roger W. Romani; Robert V. Wagner; Arthur B. C. Walker, Jr.
Professors: Blas Cabrera (Physics), Peter Michelson (Physics), Vahé Petrosian (Physics, Applied Physics), G. Leonard Tyler (Electrical Engineering), Robert V. Wagner (Physics), Arthur B. C. Walker, Jr. (Physics, Applied Physics)
Associate Professors: Roger W. Romani (Physics)
Assistant Professor: Sarah Church (Physics)
Professor (Research): Philip H. Scherrer

Although Stanford University does not have a degree program in astronomy or astrophysics, teaching and research in various branches of these disciplines is an ongoing activity in the departments of Applied Physics, Electrical Engineering, and Physics. For the convenience of students interested in the general areas of astronomy, astrophysics, and cosmology, a course program for undergraduate and graduate study is listed below.

The program is especially committed to providing introductory courses for the student who wishes to be informed about the fields of astronomy without the need for prerequisites beyond high school algebra and physics. Astronomy courses numbered below 100 are designed to serve this group of students.

Astronomy courses numbered 100-199 serve the student interested in an initial scientific study of astronomy.

The courses numbered 200 and above are for graduate students and advanced undergraduates, subject to prior approval by the course instructor.

UNDERGRADUATE PROGRAMS

The University does not offer a separate undergraduate major in astronomy. Students who intend to pursue graduate study in astronomy or space science are encouraged to major in physics, following the advanced sequence if possible, or in electrical engineering if the student has a strongly developed interest in radioscience. The course descriptions for these basic studies are listed under the appropriate department sections of this bulletin. Students desiring guidance in developing an astronomy-oriented course of study should contact the chair of the Astronomy Program Committee. The following courses are suitable for undergraduates and are recommended to students considering advanced study in astronomy or astrophysics: 100, Introduction to Observational and Laboratory Astronomy; 162 or EE 106, Planetary Exploration; 160, Introduction to Stellar and Galactic Astrophysics; 161, Extragalactic Astrophysics and Cosmology. Students planning study in astronomy beyond the B.S. are urged to take 260 and 262, Introduction to Astrophysics and to Gravitation, and to consider an undergraduate thesis (Astronomy 169) or honors thesis in an astrophysics related area. The above-mentioned courses are required for physics majors who choose the curriculum with concentration in astrophysics (see the “Physics” section of this bulletin). The student observatory, located in the hills to the west of the campus and equipped with a 24-inch and other small reflecting telescopes, is used for instruction of the observation oriented courses.

MINORS

The minor program in Astronomy is described in the “Physics” section of this bulletin. A non-technical minor, intended for students whose major does not require the Physics 40 series, requires 9 units of Physics courses (21, 23, 25) and 10 units of Astronomy courses (50 or 100, 3-4 units; 15, 16, 18N, 27, and 162, 6-7 units). The technical major for other students consists of Physics courses 27, 70, 100, 160, 161, and 162 (or EE 106). To be accepted to the minor program, students need to obtain an adviser selected from the faculty in the Astronomy Course Program. The minor declaration deadline is three quarters before graduation (that is, beginning Autumn Quarter if the student is graduating at the end of Spring Quarter). All courses for the minor must be taken at Stanford University, and a letter grade of "C" or better must be received for all units applied toward the minor.

GRADUATE PROGRAMS

Graduate programs in astronomy and astrophysics, and related topics, are carried out in the departments of Applied Physics, Electrical Engineering, and Physics. Students should consult the course listings, degree requirements, and research programs of these departments for more detailed information. For graduate research opportunities, see the “Center for Space Science and Astrophysics” section of this bulletin.

Stanford is a member of a consortium using the Hobby Eberly telescope, a 10-meter-class telescope located at McDonald Observatory in Texas. Opportunities to do research projects using this telescope are available for graduate students.

Students planning to conduct research in astronomy and astrophysics are required to take Physics 360 (Physics of Astrophysics) and at least one of the following: 361 (Stellar and Galactic Physics), 362 (Extragalactic Astrophysics and Cosmology), or 363 (Solar and Solar-Terrestrial Physics). Students lacking background in astrophysics, gravitation, and plasma physics are recommended to take Physics 260 and 262, Introduction to Astrophysics and to Gravitation, and 312 on Plasma Physics. Students with special interests in gravitation are recommended to take Physics 364, Advanced Gravitation.

Students interested in research programs in space physics involving spacecraft studies of the planets, their satellites, and their near-space environments should see the “Center for Space Science and Astrophysics” section of this bulletin.

COURSES

ELEMENTARY LECTURES

The following courses provide a descriptive knowledge of astronomical objects and astrophysics of the universe. Physics 15 and 16 are for students not majoring in the sciences and are taught in different quarters by different instructors, but are related in topic. Physics 27 is similar to 16, but at a more quantitative level. Physics 18N is a freshman seminar and 81Q and 82Q are sophomore dialogues.
15. The Nature of the Universe
3 units, Aut (Cabrera)

16. Cosmic Horizons
3 units, Win (Linde)

18N. Stanford Introductory Seminar: Revolutions in Concepts of the Cosmos
4 units, Spr (Staff)

27. Evolution of the Cosmos
3 units, not given 2000-01

81Q. Stanford Introductory Dialogue: Lookback Time in Cosmology
1 unit, Aut (Romani)

82Q. Stanford Introductory Dialogue: Expanding Cosmic Horizons
1 unit, Spr (Wagoner)

OBSERVATORY
The following courses are intended to familiarize students with observational methods and analysis of astronomical data. Physics 100 involves more advanced observations and is intended for students with some background in physics.

PHYSICS

50. Astronomy Laboratory and Observational Astronomy
3-4 units, Aut, Sum (Staff)

100. Introduction to Observational and Laboratory Astronomy
4 units, Spr (Staff)

ADVANCED UNDERGRADUATE
The following courses are for students with more advanced knowledge of basic physics and mathematics and form the core courses for a concentration in astrophysics for Physics majors.

ELECTRICAL ENGINEERING

106. Planetary Exploration
3 units, Spr (Fraser-Smith)

PHYSICS

160. Introduction to Stellar and Galactic Astrophysics
3 units, Aut (Petrosian)

161. Introduction to Extragalactic Astrophysics and Cosmology
3 units, Spr (Church)

169A,B,C. Independent Study in Astrophysics and Honors Thesis
1-9 units, Aut, Win, Spr (Staff)

GRADUATE

PHYSICS

260. Introduction to Astrophysics
3 units

261. Stellar and Galactic Astrophysics
3 units, Spr (Petrosian)

362. Extragalactic Astrophysics and Cosmology
3 units

363. Solar and Solar-Terrestrial Physics
3 units (Kosovichev) alternate years, given 2001-02

364. Advanced Gravitation
3 units, Aut (Wagoner)

463. Special Topics in Astrophysics
3 units

ATHLETICS, PHYSICAL EDUCATION, AND RECREATION

Emeriti: (Professor) Wesley K. Ruff; (Associate Professor) William P. Fehring; (Athletic Director) Joseph H. Ruetz; (Associate Director) Robert C. Young; (Assistant Director) Shirley Schoof

Athletic Director: Ted Leland
Associate Athletic Director, External Relations: Darrin Nelson
Associate Athletic Director, Finance and Operations: Debra Gore-Mann
Assistant Athletic Director, Operations and Events: Ray Purpur
Assistant Athletic Director, Development: Karen Recht
Assistant Athletic Director, Finance: Joe Mitchner
Assistant Athletic Director, Marketing, Tickets: Bob Carruesco
Assistant Athletic Director, Football Operational/Athletic Services: Scott Schuhmann
Assistant Athletic Director, Media Relations: Gary Migdol
Assistant Athletic Director, Student Services: Susan Burk
Assistant Athletic Director, Intercollegiate Sports and Championships: Earl Koberlein

Director, Major Gifts: John R. Kates
Director of Physical Education, Club Sports, Intramurals and Recreation: Sherry Posthumus

Senior Lecturers: Anne Gould, Elizabeth Weeks

Sports Directors: Aimee Baker (Crew, women), Steve Bourdow (Sailing), Bobby Clark (Soccer, men), Mark Cook (Gymnastics, women), Denise Corlett (Volleyball, women), Dante Dettamanti (Water Polo, men), Gail Emery (Synchronized Swimming), Lele Forood (Tennis, women), Richard Gould (Tennis, men), Sadao Hamada (Gymnastics, men), Chris Horpel (Wrestling), Heidi Connor Igoe (Lacrosse), Sheryl Johnson (Field Hockey), Skip Kenney (Swimming, men), Wieslaw Kujda (Crew, men), Vin Lannana (Track and Field/Cross Country), Mark Marquess (Baseball), Lisa Milgram (Fencing), Jeff Mitchell (Golf, men), Mike Montgomery (Basketball, men), Andy Nelson (Soccer, women), Ruben Nieves (Volleyball, men), Caroline O’Connor (Golf, women), Richard Quick (Swimming, women), John Rittman (Softball), Richard Schavone (Diving), John Tanner (Water Polo, women), Tara VanDerveer (Basketball, women), Tyrone Willingham (Football)

Sport Assistant Coaches: Lonni Alameda (Softball), Kyle Asano (Gymnastics, men), Kent Baer (Football), Nathalie Bartleson (Synchronized Swimming), Tom Brattan (Football), Steve Buddie (Wrestling), Patrick Burrows (Field Hockey), Josh Cohen (Volleyball, women), Rene Lyt Cook (Gymnastics, women), Bill Diedrick (Football), Dena Evans (Track and Field/Cross Country), Edrick Floreal (Track and Field), Kristine Franson (Crew, women), Tony Fuller (Basketball, men), Ross Gerry (Swimming, women), Tia Jackson (Basketball, women), John Kaity (Crew, men), Ted Knapp (Swimming, men), Eric Knopf (Sailing), John Kosty (Volleyball, men), Karen Middleton (Basketball, women), Chuck Moller (Football), Mark O’Brien (Baseball), Kim Oden (Volleyball, women), Susan Ortwein (Water Polo, women), Sara Pickering (Softball), Christy Plotner (Lacrosse),
The goals of the department's programs are to promote understanding of the value and role of physical activity as an important dimension of the human condition, to develop performance skills in sport, to develop the habit of participation, and to provide leadership opportunities in informal recreation through organized intramural competition, both men's and women's varsity teams. Those for men are baseball, basketball, crew, cross country, fencing, football, golf, gymnastics, sailing, soccer, swimming and diving, tennis, track and field, volleyball, water polo, and wrestling. Those for women are basketball, crew, cross country, fencing, field hockey, golf, gymnastics, lacrosse, sailing, soccer, softball, swimming and diving, synchronized swimming, tennis, track and field, volleyball, and water polo.

Both men's and women's teams are affiliated with the Pacific Ten Conference, one of the premier athletic conferences in the nation. Additional or alternative intercollegiate athletic competition is available for all teams.

The Stanford Club Sports program is coeducational. It provides competition in sports not included in the intercollegiate varsity program and instruction in classes or activities not included in the Physical Education program. It also develops student leadership in organizing, administering, and funding activities. The club program is actively supervised by the Director of Club Sports, but the emphasis is on student interest and participation to initiate, organize, and conduct the respective clubs. Those students in clubs that meet the criteria for inclusion in the formal curriculum may apply for units of credit. Club sport teams competing against other college, university, and/or club teams and requiring eligibility certification for their team members must make such arrangements through the Director of Club Sports.

FACILITIES

Athletic facilities are located throughout the campus. On the west side of campus are the Golf Course, the Golf Driving Range, the Red Barn Stables, Rothenbuhler Gym, the Sand Hill Intramural Fields, and the West Campus Tennis Courts. Central to the campus is the Tressider Fitness Center. On the east side of campus are the Arrillaga Family Sports Center, the Avery Aquatic Center, Burnham Pavilion, Cobb Track and Angell Field, DeGuere Courts, Encina Tennis Courts, the Ford Center for Sports and Recreation, the Maloney Fields, Maples Pavilion, the Stanford Stadium, Sunken Diamond, and Taube Tennis Stadium.

Off campus facilities include a sailing center and a rowing facility.

CURRICULUM AND SERVICES

The diverse instructional program strives to accommodate the sports interests of all undergraduate and graduate students. Only intercollegiate varsity men's and women's teams are limited to undergraduates. Homogeneous skill groupings and limited class sizes enable the beginning student or the advanced performer to achieve success within the limits of individual motivation and potential. Skill level in, and knowledge about, a specific activity as well as available space are the only limitations to enrollment. Physically disabled students are encouraged to contact Sherry Posthumus for enrollment advice.

Academic Credit—Activity classes carry 1 unit of credit for satisfactory completion of work. Although there is no limitation on the number of activity classes in which a student may enroll, no more than 8 units of these activity classes (and/or other University activity classes) may be applied toward undergraduate graduation requirements (see the "Undergraduate Degrees" section of this bulletin).

Auditing—No auditing is allowed in activity classes. Faculty and staff may take an activity class as space is available with instructor consent after student enrollment is completed.

Class Fees—Fees are charged for enrollment in all physical education classes and club sports.

Class fees are payable only by check or money order. Cash is not acceptable. Checks or money orders should be made payable to Stanford University. Fees are payable at the first, and are required by the second, class meeting for a student to remain in class. Late enrollees must submit fees no later than the second time they attend the class.

Full refund is given to students who drop a class during the first two weeks of classes and request a refund at that time. No refund is given if a student either neglects to request a refund under the conditions listed previously or drops the class after the second week.

Class Sign-Ups vs. Axess—Information on sign-up procedures can be found on the department's website. Students must attend the first class
meeting. If accepted into the class, they can register for that class through Axess.

**Deadline for Adding a Class**—Students who have never appeared in a class may not enroll in that class after the fourth class meeting has passed. Students may add the class after the fourth meeting if they have been in attendance and, for whatever reason, did not get registered until the fourth week (the University deadline for adding courses).

**Equipment**—Students provide their own rackets for tennis. Specific information on equipment and C recommended class attire is available from the department or instructor.

**Lockers**—Lockers are available for rent to faculty/staff and students at the Arrillaga Family Sports Center and Roble Gym. The fee for faculty/staff is $15 a quarter or $40 a year. The fee for students is $10 a quarter or $25 a year.

**COURSES**

(AU) indicates that the course is subject to the University Activity Unit limitations (8 units maximum). See www.stanford.edu/dept/pe for further information on course descriptions and sign-up procedures.

**PHYSICAL EDUCATION AND SPORTS THEORY**

190. **Analysis of Human Movement**—Overview of skeletal and muscular anatomy and a study of the mechanical principles of movement as related to efficient performance in aquatics, dance, and sports.

3 units, Aut, Win (Weeks)

**LEADERSHIP OPPORTUNITIES IN PHYSICAL EDUCATION**

81. **Manager: Athletic Team**—For student managers of intercollegiate teams. Prerequisite: consent of respective varsity team head coach. (AU)

1 unit, Aut, Win, Spr (Staff)

**AQUATIC ACTIVITY**

78. **Lifeguard Training**—Priority to those with summer jobs requiring certification and for those wishing to guard at Stanford during the year. Lifeguard characteristics and responsibilities, recognition of hazards and emergencies, patron and facility surveillance, interaction with the public, rescue skills. Community first aid and CPR for the professional rescuer. Bring letter from employer to first class meeting. Fee. Recertification weekend session in CPR/PR and LGT/FA in late April or early May. See web site. Prerequisite: pass swim test (swimmer/advanced swimmer level).

2 units, Spr (Weeks)

106. **Sailing: Beginning Keelboat**—Basic skills, theory, and techniques to enable beginners to sail with confidence. Emphasis is on safety and seamanship skills. Fee. (AU)

1 unit, Aut, Spr (Bourdow)

107. **Sailing: Beginning Dinghy**—Basic skills, theory, and techniques to enable beginners to sail with confidence in small centerboard boats. Fee. (AU)

1 unit, Aut, Spr (Bourdow)

108. **Sailing: Intermediate**—Refine skills. Introduction to racing. Fee. Prerequisite: consent of instructor. (AU)

1 unit, Aut, Spr (Bourdow)

109. **Sailing: Advanced**—Refinement of heavy weather sailing skills, with emphasis on racing. Fee. Prerequisite: 108 or consent of instructor. (AU)

1 unit, Spr (Bourdow)

130. **Swimming I: Beginning**—For non-swimmers or those who can swim about 10 yards but are not comfortable in deep water. Instruction in safety skills, front crawl, and a back stroke. Additional strokes introduced as ability warrants. Fee. (AU)

1 unit, Aut, Spr (Dettamanti, Weeks)

131. **Swimming II: Advanced Beginning**—For those with limited swimming ability and safety skills who may not be fully comfortable in deep water. Work on safety skills, crawl, and elementary backstroke or back crawl. Introduction to sidestroke and breaststroke. Improve skills and increase time and distance of swim. Prerequisite: ability to swim 25-50 yards on front and on back reasonably comfortably. Fee. (AU)

1 unit, Aut, Win, Spr (Gerry, Weeks)

132. **Swimming III: Intermediate**—Continued work on crawl, elementary backstroke, backstroke, and sidestroke. Safety skill work as needed. Introduction to or review of breaststroke. Open turns. Introduction to butterfly, flip turn, and conditioning. Fee. Prerequisites: fair technique in crawl, elementary backstroke, backstroke; some sidestroke and breaststroke; ability to swim approximately 100-200 yards continuously by mixing strokes. (AU)

1 unit, Aut, Win, Spr (Gerry, Weeks)

133. **Swimming IV: Advanced**—Review and refine all basic strokes and safety skills. Introduction to or review of butterfly and flip turn. Stroke drills and information on conditioning and designing individual workouts. Prerequisite: average to good strokes; ability to swim approximately 400-500 yards continuously. Fee. (AU)

1 unit, Aut, Win, Spr (Dettamanti, Quick, Tanner)

166. **Water Polo: Beginning**—Introduction to basic skills and game play. For those who have never played or have had limited experience. Fee. (AU)

1 unit, Spr (Dettamanti)

167. **Water Polo: Intermediate/Advanced**—Further work on skills. Game strategies. Fee. (AU)

1 unit, Aut, Spr (Dettamanti, Tanner)

**FITNESS, INDIVIDUAL, AND TEAM SPORT ACTIVITIES**

2. **Aerobics**—High-powered strength building class. Focus is on body awareness, balance of strength and flexibility through continuous body motion and cardiovascular enhancement. All levels. Fee. (AU)

1 unit, Aut, Win, Spr (Coughlin)

21. **Conditioning Advanced**—Active participation in conditioning exercises advancing from aerobic to intense anaerobic interval conditioning. Offered by appointment. Prerequisite: pass a physical exam prior to enrollment. (AU)

1 unit, Win (Wateska)

31. **Cross Training for Overall Fitness**—Participate in a variety of activities (e.g., track intervals, sprints, plyometrics) designed to promote cardiovascular fitness and overall conditioning. Fee (AU)

1 unit, Au (Evans)

38. **Fencing: Beginning**—The sport of swordmanship develops quick hands, strong legs, and a strategic mind. Basic footwork, handwork, and bouting. Emphasis is on foil technique. All equipment provided. Fee. (AU)

1 unit, Aut, Win, Spr (Milgram, Pogosov)

39. **Fencing: Intermediate/Advanced**—Continuation of 38; learn advanced footwork and handwork. Strategy and bouting. Introduction to
40. Fencing: Saber Class—Continuation of 38. Learn saber technique, the fastest of the three weapons. Saber takes speed, quick reflexes and a sly, strategic mind. All equipment provided. Fee. Prerequisite: 38 or consent of instructor. (AU)

1 unit, Win (Johnson)

45. Field Hockey: Advanced for Women—Techniques and skills under competitive pressure. Must know team strategies and positioning. Fee. (AU)

1 unit, Win (Pogosov)

52. Golf: Beginning—The fundamentals of the golf swing; introduction to putting, chipping, sand play. Golf etiquette and knowledge of rules enable a beginner to play a round of golf. Fee. (AU)

1 unit, Aut, Win, Spr (Hamada, Miller, Uchiyama)

53. Golf: Advanced Beginning—Further development of the golf swing and short game. How to practice effectively and gain the confidence to play a round of golf. Rules and etiquette. Prerequisite: 52 or previous golf experience. Fee. (AU)

1 unit, Aut, Win, Spr (Hamada, Miller)

54. Golf: Intermediate—Improvement through the use of drills and practice on all facets of golf game. Utilization of these skills in the game. Lower your score and manage your game on the course. Fee. Prerequisite: 52 or the equivalent. (AU)

1 unit, Aut, Win, Spr (Hamada, Miller)

55. Golf: Advanced—Understand and refine the golf swing and increase power, distance, and accuracy. Course management, mental preparation, visualization techniques. Fee. Prerequisites: 54 or experience playing and practicing, and the ability to hit shots with relative accuracy and distance. (AU)

1 unit, Aut, Win, Spr (Miller)

59. Gymnastics: Beginning—Fundamental gymnastics movement for men and women, including flexibility and strength exercises taught on the Olympic apparatus (e.g., floor, balance beam, bars, rings, etc.). Fee. (AU)

1 unit, Aut, Win, Spr (Cook, Hamada)

60. Gymnastics: Intermediate/Advanced—For students who have completed 59 or have a background in gymnastics. Emphasis is on tumbling and somersaulting. Group work and individualized instruction for men and women. Limited apparatus work. Fee. (AU)

1 unit, Aut, Win, Spr (Cook)

65. Horsemanship: Beginning Riding—No background or very little. Includes walk, trot, and canter. Fee. (AU)

1 unit, Aut, Win, Spr (Saxe, Staff)

66. Horsemanship: Advanced Beginning Riding—Can walk and trot, but not with very secure seat. Gymnastic work develops position and rhythm. Fee. (AU)

1 unit, Aut, Win, Spr (Saxe, Staff)

68. Horsemanship: Intermediate Riding and Jumping—Work at the walk, trot, canter. Cross rails up to two foot jumps. Fee. (AU)

1 unit, Aut, Win, Spr (Saxe, Staff)

73. Interval Training—For students who want to improve their overall fitness level. Active participation in workouts include brief periods of high intensity exercise interspersed with lower-intensity exercise or rest. Short duration agility runs, weight lifting, and cardiovascular improve-
experience. NTRP rating of 3.0 or equivalent. Fee. (AU)

1 unit, Aut, Win, Spr (Staff)

151. Tennis: Advanced—Review of fundamental strokes. Drills emphasize footwork, serve and return, approach shots, volleys, lobs, and overheads. Strategy for competition in singles and doubles. Prerequisites: well above average stroking and game playing ability; NTRP rating above 4.0 or equivalent. Fee. (AU)

1 unit, Aut, Win, Spr (Staff)

152. Tennis: Tournament—Advanced drills and practice sessions for tournament-experienced players of near-varsity-level ability. Tryouts at Taube Tennis Stadium in Autumn Quarter for autumn enrollment and background in computers and statistics. (AU)

Prerequisite: consent of instructor. Recommended: excellent knowledge of the game. Assist players and coaches by collecting data on player performance. Fee. Prerequisite: consent of instructor. (AU)

1 unit, Aut, Win, Spr (Whittington)

154. Tennis: Analysis—Use of computer for analyzing tennis matches. Assist players and coaches by collecting data on player performance. Prerequisite: consent of instructor. Recommended: excellent knowledge of tennis, background in computers and statistics. (AU)

2 units, Aut, Win, Spr (Forwood, D. Gould)

159. Volleyball: Sand—For intermediate and advanced players to improve skills and game playing strategy in both two- and four-person sand volleyball. Prerequisites: 161 and/or 162, or strong skills and general knowledge of indoor volleyball. Fee. (AU)

1 unit, Spr (Kosty)

1 unit, Aut, Win, Spr (Corlett, Kosty)

161. Volleyball: Intermediate—Drills to improve skills and game playing strategy. As ability indicates, more emphasis on team play and strategy. Fee. (AU)

1 unit, Aut, Win, Spr (Kosty, Nieves)

162. Volleyball: Advanced—Refine all skills, emphasizing offensive and defensive team play. Fee. Prerequisites: strong skills and general knowledge of team concepts. (AU)

1 unit, Aut, Win, Spr (Nieves)

1 unit, Aut, Win, Spr (Nieves)

175. Weight Training: Intermediate—Review of basic exercises and techniques. Emphasis is on individualized programs and learning the use of all available machines and free weights. Further discussion on exercise physiology. Fee. Prerequisite: 174 or thorough knowledge of basic weight training principles. (AU)

1 unit, Aut, Win, Spr (Staff)

177. Weight Training for Women—All levels welcome, but designed for the beginner. Introduction to the techniques and equipment for weight training. Emphasis is on stretching, proper form and progressions, and injury prevention. The basics of the physiology of strength training and planning individual programs. Fee. (AU)

1 unit, Aut, Win, Spr (Staff)

183. Wrestling: Beginning/Intermediate—Introduces intercollegiate wrestling. Conditioning, cultivating the spirit of one-on-one competition. Basic skills and high-level sequences of upper- and lower-body technique. Fee. (AU)

1 unit, Spr (Horpel)

188. Yoga: Beginning—Challenging practice designed for beginning-intermediate student. Focus is on a completely integrated and balanced body. Promotes increased flexibility; strengthens skeletal, muscular, and nervous systems; improves circulation; releases tension and stress; improves concentration and clarity of mind. Fee. (AU)

1 unit, Aut, Win, Spr (Coughlin)

189. Yoga: Intermediate—Builds and expands on the basic asanas. Student should be comfortable with the beginning class and ready for more challenging poses. More inverted poses, i.e., shoulder stand. Range of motion is increased as is length of time in poses. Deeper understanding of pranayama. Fee. Prerequisite: beginning yoga or previous yoga experience. (AU)

1 unit, Aut, Win, Spr (Coughlin)

INTERCOLLEGIATE ATHLETIC TEAMS

Varsity men's and women's teams in PAC-10 are for the highly talented and motivated undergraduate student. Unless specified, team tryouts are open to men and women students.

14V. Baseball: Varsity-Men's team. (AU)

1-2 units, Aut, Win, Spr (Marquess, Stotz)

17V. Basketball: Varsity-Men's and women's teams. (AU)

1-2 units, Aut, Win (Montgomery, Staff) men's team

1 unit, Win (Van Derveer, Staff) women's team

26V. Crew: Varsity-Men's and women's teams. (AU)

1-2 units, Aut, Win (Kujda) men's team

1 unit, Win, Spr (Baker) women's team

29V. Cross Country: Varsity-Men's and women's teams. (AU)

1-2 units, Aut (Lananna)

35V. Diving: Varsity-Men's and women's teams. (AU)

1-2 units, Aut, Win (Schavone)

41V. Fencing: Varsity-Men's and women's teams. (AU)

1-2 units, Aut, Win (Emery)

49V. Football: Varsity-Men's team. (AU)

1 unit, Win, Spr (Cook) women's team

75V. Lacrosse: Varsity-Men's and women's teams. (AU)

1-2 units, Aut, Win, Spr (Igoe)

62V. Gymnastics: Varsity-Men's and women's teams. (AU)

1-2 units, Aut, Win, Spr (Mitchell) men's team

1 unit, Win (O'Connor) women's team

75V. Lacrosse: Varsity-Women's team. (AU)

1-2 units, Aut, Win, Spr (Igoe)

111V. Sailing: Varsity-Coed and women's teams. (AU)

1-2 units, Aut, Win, Spr (Bourdow)

124V. Soccer: Varsity-Men's and women's teams. (AU)

1-2 units, Aut, Spr (Clark) men's team

1 unit, Spr (Nelson) women's team

127V. Softball: Varsity-Women's team. (AU)

1-2 units, Aut, Win, Spr (Rittman)

136V. Synchronized Swimming—Women's team. (AU)

1 unit, Win (Emery)
137V. Swimming: Varsity—Men’s and women’s teams. (AU)
   1-2 units, Aut, Win, Spr (Kennedy) men’s team
   Aut, Win, Spr (Quick) women’s team

153V. Tennis: Varsity—Men’s and women’s teams. (AU)
   1-2 units, Aut, Win, Spr (Gould) men’s team
   Aut, Win, Spr (Forood) women’s team

157V. Track and Field: Varsity—Men’s and women’s teams. (AU)
   1-2 units, Aut, Win, Spr

163V. Volleyball: Varsity—Men’s and women’s teams. (AU)
   1-2 units, Aut, Win, Spr (Nieves) men’s team
   Aut, Win, Spr (Corlett) women’s team

168V. Water Polo: Varsity—Men’s and women’s teams. (AU)
   1-2 units, Aut, Win, Spr (Dettamanti) men’s team
   Aut, Win, Spr (Tanner) women’s team

184V. Wrestling: Varsity—Men’s team. (AU)
   1-2 units, Aut, Win, Spr (Horpel)

CLUB SPORTS

The Stanford Club Sports Program is affiliated with the department but is initiated, organized, and conducted by students. All clubs are coeducational except as specified. Clubs, whose instructional classes meet the criteria for academic credit, are scheduled for meeting times as published each quarter in the Time Schedule. For additional information, contact the Club Sports Director.

11C. Badminton Club Team—(AU)
   1 unit, Aut, Win, Spr

32C. Cycling Club Team—(AU)
   1 unit, Aut, Win, Spr

36C. Equestrian Club Team—(AU)
   1 unit, Aut, Win, Spr

70C. Horse Polo Club Team—(AU)
   1 unit, Aut, Win, Spr

72C. Ice Hockey Club Team—Men. (AU)
   1 unit, Aut, Win

75C. Lacrosse Club Team—Men. (AU)
   1 unit, Aut, Win, Spr

88C. Judo Club Team—(AU)
   1 unit, Aut, Win, Spr

104C. Rugby Club Teams—Men’s and women’s teams. (AU)
   1 unit, Aut, Win

118C. Ski Club Team—(AU)
   1 unit, Win

158C. Ultimate Frisbee Team—Women. (AU)
   1 unit, Aut, Win, Spr

Additional clubs (Cricket, Squash, Table Tennis, and Ultimate Frisbee—men) schedule activities each quarter for no credit.

BIOLOGICAL SCIENCES

Emeriti: (Professors) Winslow R. Briggs, David D. Perkins, David C. Regnery, Robert Schimke, Dow O. Woodward; Professor (Research) R. Paul Levine; (by courtesy) Peter Ray, Charles Yanofsky

Chair: H. Craig Heller

Associate Professors: Barbara A. Block, Martha S. Cyert, Deborah M. Gordon, Susan K. McConnell, Michael A. Simon

Assistant Professors: David Ackery, Brenda Bohannan, Guowei Fang, Judith Frydman, Elizabeth A. Hadly, Liqun Luo, Fiorenza Micheli, Dmitri Petrov, Michael F. Rexach, Tim Stearns

Associate Professor (Teaching): Carol L. Boggs

Professor (Research): Robert Metzenberg, Jr.

Courtesy Professors: Joseph Berry, Richard G. Klein, Irving L. Weissman

Courtesy Associate Professors: Christopher B. Field, Arthur R. Gorman

Courtesy Assistant Professor: Alfred Spormann

Lecturers: Kristin Black, Shyamala D. Malladi, Laura McIntosh, James Watanabe, Melanie Yelton

Consulting Professor: Terrence M. Gosliner

Consulting Associate Professor: Nina G. Jablonski

Visiting Associate Professor: Alex Meyer

Librarian: Michael Newman

The facilities and personnel of the Department of Biological Sciences are housed in the Gilbert Building, Herrin Laboratories, Herrin Hall, the Jasper Ridge Biological Preserve on the main campus, and at the Hopkins Marine Station in Pacific Grove on Monterey Bay.

The department provides: (1) courses designed for the nonmajor, (2) a major program leading to the B.S. degree, (3) a minor program, (4) a coterminous program leading to the M.S. degree, (5) a terminal program leading to the M.S. degree, and (6) a program leading to the Ph.D. degree.

Course work and laboratory instruction in the Department of Biological Sciences conform to the "Policy on the Use of Vertebrate Animals in Teaching Activities" section of this bulletin.

The Jasper Ridge Biological Preserve is a 1,200-acre natural area containing an unusual diversity of plant communities. It is managed solely for teaching and research purposes and is available to investigators from various institutions. Stanford-based research at Jasper Ridge currently concentrates on physiological, ecological, and population studies.

Special laboratory facilities for marine research are described in the pamphlet Hopkins Marine Station, available at the department’s Student Services office (Gilbert 108) or from Hopkins Marine Station.

The department’s large collections of plants (Dudley Herbarium), fishes, reptiles, and amphibians, as well as smaller collections of birds, mammals, and invertebrates, are housed at the California Academy of Sciences in San Francisco, where they, and extensive collections of the academy, are available to those interested in the systematics of these groups. Entomological collections, restricted to those being used in particular research projects, are housed in the Herrin Laboratories. No general collections are maintained except for teaching purposes.

The Falconer Biology Library in Herrin Hall contains over 1,200 current subscriptions and an extensive collection of monographs and reference works. A specialized library is maintained at the Hopkins Marine Station.

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

ADvising

Most members of the Biological Sciences faculty are available for advising on such academic matters as choice of courses and career plans. The Student Services office maintains a current list of faculty advisers, advising schedules, and research interests.
The Student Services office is prepared to answer questions on administrative matters, such as requirements for the major, approved out-of-department electives, transfer course evaluations, and petition procedures. This office also distributes the department’s Bachelor of Science Handbook, which delineates policies and requirements, as well as other department forms and information handouts.

Each undergraduate student interested in the major in Biological Sciences is required to select a department adviser as part of the major declaration process. Students who plan to attend medical or graduate school, enroll in the honors or coterminal programs, take courses at Hopkins Marine Station, or attend one of the overseas campuses will find their faculty adviser particularly helpful.

REQUIREMENTS

Candidates for the B.S. degree must complete:

Core Courses and Electives—

<table>
<thead>
<tr>
<th>Course No. and Subject</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Biology 44X</td>
<td>4</td>
</tr>
<tr>
<td>Biology 44Y (may be replaced by 4 units of 175H)</td>
<td>4</td>
</tr>
<tr>
<td>Biology 41 or 51*</td>
<td>5</td>
</tr>
<tr>
<td>Biology 42 or 52*</td>
<td>5</td>

<td>5</td>
</tr>
<tr>
<td>Total</td>
<td>23</td>
</tr>
<tr>
<td>Electives</td>
<td>24</td>
</tr>
</tbody>
</table>

* Letter grade only.

Required Cognate Courses—

Students may take up to two cognate courses credit/no credit (CR/NC).

1. Introductory, organic, and physical chemistry with lab: Chemistry 31 (or 32), 33, 35, 36, 130 (or 132), 131, 135 (or 171). For those interested in ecology and evolution biology, an advanced math course of 100-level or above may be substituted for 130 or 132.

2. General Physics: Physics 21, 22, 23, 24; or 41, 43, 45, 47.

3. Math through calculus: Mathematics 19, 20, 21; or 41, 42.

4. One additional course in mathematics, statistics, or computer science: Mathematics 51 or beyond; Biology 141 (if taken to fulfill additional cognate requirement, this does not count toward the 24 elective unit requirement), or Psychology 10; Statistics 60 or beyond; or Computer Science 106A or X.

Electives must be 100-level or above and selected from the offerings in the Department of Biological Sciences or from the list of approved out-of-department electives. This list may be obtained from the Student Services office. Biology majors must include at least two courses of at least 3 units each taught by two different Biological Sciences faculty members in the courses they take to fulfill the department’s 24 elective unit requirement. Courses that are “team taught” by a Biological Sciences professor and a non-Biological Sciences professor will only count as 1/2 credit towards the faculty requirement. A list of Biological Sciences professors is available from the Student Services office.

The program for the junior and senior year should include a total of 24 elective units beyond the core. The courses making up these units should include at least one course from at least three of the following four areas. The rest of the 24 units can include more courses from this central menu, courses available in diverse areas directly after the core, or advanced courses for which "menu" courses are prerequisites. A complete central menu course listing including inactive and alternate year courses is available in the Student Services office.

Active central menu courses are:

1. Molecular
   Biochemistry: Biochem. 200
   Cell Biology—Molecular Organization: Bio. 128*
   Developmental Genetics: Bio. 132*
   Genetics: Bio. 118*
   Molecular Biology: Biochem. 201
   Prokaryote Genetics: Bio. 133*

2. Cell/Developmental
   Cell Biology—Cellular Dynamics: Bio. 129
   Cell Biology—Molecular Organization: Bio. 128*

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Cell Physiology: Bio. 160H</td>
<td></td>
</tr>
<tr>
<td>Developmental Genetics: Bio. 132*</td>
<td></td>
</tr>
<tr>
<td>Genetics: Bio. 118*</td>
<td></td>
</tr>
<tr>
<td>Prokaryote Genetics: Bio. 133*</td>
<td></td>
</tr>
</tbody>
</table>

3. Organismal
   Comparative Animal Physiology: Bio. 162H
   Ecological and Evolutionary Physiology: Bio. 171H
   Ecology and Evolution of Plants: Bio. 138
   Human Physiology: Bio. 112
   Invertebrate Zoology: Bio. 161H
   Microbiology: Microbio. & Immun. 185
   Neurobiology: Bio. 153
   Neurobiology: Bio. 154
   Neurobiology & Behavior: Bio. 169H
   Plant Physiology: Bio. 256
   Vertebrate Biology: Bio. 140 (lecture only)
   Viruses: Bio. 213

4. Ecology and Evolution
   Biogeography: Bio. 121
   Evolutionary Paleobiology: Bio. 136
   Behavioral Ecology: Bio. 145
   Oceanic Biology: Bio. 163H
   Principles of Ecology: Bio. 142

   Principles and Practice of Biosystematics: Bio. 184

* May be used to satisfy either area I or area II requirement.

No more than 6 units from any combination of individual instruction courses (175H, 198, 199, 290, 291, or 300) may be applied toward the total number of elective units. No more than 6 units applied toward the elective unit requirement may be taken CR/NC.

Students intending to pursue research careers in biology, especially in ecology, population genetics, or theoretical biology, should be aware that Mathematics 19, 20, 21, or Mathematics 41, 42 are minimum math requirements for the B.S. degree in Biological Sciences. Substantial additional training in mathematics, including differential equations, linear algebra, and probability theory, is often highly advisable. Students should consult the Biological Sciences faculty to discuss individual needs.

Additionally, even though only two or three quarters of physics are required, students should be aware that many graduate and professional schools (for example, medicine and education) require a year of general physics with a lab. Biological Sciences majors are therefore advised to take the year-long physics sequence Physics 21, 22, 23, 24, 25, 26 (or Physics 41, 43, 45, 46, 47, 48).

For students considering residence at Hopkins Marine Station during the junior or senior year, or an overseas program, the department recommends fulfilling as many University General Education Requirements as possible in the first two years at Stanford.

TRANSFER STUDENTS

Because of differences between Stanford undergraduate courses and prerequisites and those of many other institutions, transfer students may face problems not encountered by entering freshmen. Transfer students are strongly urged to visit the Student Services office in Gilbert 108 during Transfer Orientation to obtain information on credit evaluations. Course catalogs, syllabi, and/or lecture notes from the former institution are necessary in the evaluation and accreditation process. Transfer students are encouraged to find a faculty adviser soon after arrival.

All transfer courses intended to fulfill department requirements must be evaluated on Evaluation of Transfer Course Content forms (available in the Student Services office), which is kept in the student's file. This department procedure is in addition to the process of having units earned at other institutions transferred for Stanford credit and which appear on the Stanford transcript.

The department authorizes transfer credit only for courses whose content parallels the Stanford courses and that have comparable prerequisites (not merely a comparable course title). To substitute a course taken elsewhere for an upper-division Stanford course, course content must be approved by a department faculty member teaching in the area of the course. Submit as complete a course description as practical (including prerequisites and their descriptions) using the Evaluation of Course Content form available in the Student Services office before taking an off-campus course. Credit for natural history, culture-biology, and similar courses is rarely appropriate and can be obtained only by meeting the same criteria outlined above. Verification of performance and the number of units are determined after completing the course. Students must provide exams, reading lists, term papers, and other materials for the evaluation. Credit is not allowed for projects for which the student was paid, nor is credit allowed for work of a purely technical or clinical nature.

MINORS

Minor declaration forms must be submitted to the department, via Axess, no later than two quarters prior to the student’s intended quarter of degree conferral. The Biological Sciences minor requires a minimum of six courses meeting the following criteria:

1. All courses must be taken for a letter grade.
2. All courses must be worth 3 or more units.
3. All courses, other than the Biology Core (51, 52, or 53; or 41, 42, or 43), must be at or above the 100-level.
4. Courses used to fulfill the minor may not be used to fulfill any other department degree requirements (minor or major).
5. At least one course from the Biology Core must be taken.
6. The Biology Core Laboratory (44X and 44Y) does not count towards the minor degree.
7. All courses must be Department of Biological Sciences elective courses or recognized out-of-department elective courses. (See the “Out-of-Department Electives” list available in the Student Services Office.)
8. Elective credit for research (199) is limited to a maximum of 3 units.

HONORS PROGRAM

To graduate with departmental honors, a student must:

1. Complete at least 10 units of an approved (Bio. 199) research project.
2. Obtain at least a 3.0 (B) grade point average (GPA) in all Biological Sciences major requirements taken at Stanford (cognate, core, and elective courses). Grades earned from teaching (290 and 291) and research (175H and 199) are not computed into this GPA.
3. Submit an honors petition proposal to the department’s Undergraduate Research Coordinator the fifth Friday of the quarter, two quarters prior to graduation. For instance, students graduating Spring Quarter must submit petitions no later than mid-Autumn Quarter.

4. If graduating in June, participate in the Biological Sciences Honors Symposium by presenting a poster or giving an oral presentation. The symposium is at the end of May. If graduating Autumn or Winter Quarter, produce a poster.
5. Complete and submit, by the end of the quarter of graduation, two signed and bound copies of an honors thesis approved by at least two readers (one of whom must be from the faculty of the Department of Biological Sciences and both Academic Council members). In addition, students must submit two copies of the honors thesis abstract, which includes name, thesis title, sponsor, and department.

Further information on the honors program, including petition forms and examples of honors posters, theses, and proposals, is available in the Group Study Room in Falconer Library. Also, see the Web page "Research and Honors" for more information about the Honors Program, including requirements, research sponsors, and petition and thesis deadlines at http://www.stanford.edu/dept/biology/undergrad/honors/. Questions should be directed to the Undergraduate Research Coordinator, Dr. Kristin Black (kblack@stanford.edu; (650) 723-3767; Gilbert 118; office hours posted quarterly.

PREMEDICAL, PREDENTAL, AND PREPARAMEDICAL REQUIREMENTS

Premedical, preclinical, and preparamedical students who are not biology majors should take at least the following courses in Biological Sciences: 44X, 44Y, 51, 52, 53; or 41, 42, 43 and such upper-division electives as may be recommended by Stanford’s Preprofessional Advising office (Undergraduate Advising Center, Sweet Hall).

COTERMINAL B.S./M.S. DEGREE

The Department of Biological Sciences admits a limited number of undergraduate students to work for coterminal B.S. and M.S. degrees in Biological Sciences. Students must apply to the program between their eighth and eleventh quarters. They are required to submit a complete application, which includes a statement of purpose, a Stanford transcript, official GRE or MCAT scores, two letters of recommendation from faculty members in this department, and a list of courses in which they intend to enroll to fulfill degree requirements. A minimum GPA of 3.0 is necessary in all courses required for the undergraduate degree in Biological Sciences. Students must meet all requirements for both the B.S. and M.S. degrees. They must complete 15 full-time quarters (or the equivalent), or three full quarters after completing 180 units. Unit requirements for a coterminal program are 180 units for the bachelor’s degree and 45 units for the master’s degree. A more detailed description of the coterminal master’s degree program may be obtained from the Student Services Office.

GRADUATE PROGRAMS

MASTER OF SCIENCE

For information on the University’s basic requirements for the M.S. degree, see the “Graduate Degrees” section of this bulletin.

The M.S. degree program offers general or specialized study to individuals seeking biologically oriented course work, and to undergraduate science majors wishing to increase or uproot their science background or obtain advanced research experience. Students who have majored in related fields are eligible to apply, but must complete, or have completed by the time of graduation, the equivalent of a Stanford B.S. in Biological Sciences.

The M.S. program consists of Department of Biological Sciences courses or approved out-of-department electives (a list is available in the Student Services Office).

1. A minimum of 36 units must be Department of Biological Sciences courses or approved out-of-department electives (a list is available in the Student Services Office).
   a) At least 18 of these 36 units must be courses designated primarily for graduate students (generally at the 200-level or above), excluding research and teaching units.

268
b) At least 9 of the 36 units must be 3-unit or more upper-division courses from the Department of Biological Sciences, taken from three different Biology faculty members. Teaching and research units do not fulfill this requirement.

c) Up to 9 of these 36 units may be advanced-level cognate courses in chemistry, computer science, mathematics, physics, or statistics beyond the level required for the undergraduate degree.

d) Up to 18 of the 36 units may be a combination of biological research and teaching (Biology courses 175H, 198, 199, 290, 291, or 300).

2. The remaining 9 units may come from any other Stanford course work other than research or teaching.

Each candidate designs a coherent program of study in consultation with her or his department adviser. Although there are no specific courses required, program proposals must adhere to department parameters.

A Program Proposal signed by the student’s adviser, and approved by the chair of the M.S. Committee, must be filed during the first month of the first quarter of enrollment. Students may take only 6 units on a credit/no credit basis and must receive a grade of 'B-' or better in all courses taken for the degree.

To apply, students submit an application for admission to the M.S. program, two letters of recommendation, official transcripts, and official Graduate Record Examination (GRE) scores. Applicants should plan on taking the GRE at least one month prior to the application deadline to insure that the official scores are available when applications are evaluated. Applications are accepted for Autumn Quarter only; the deadline is March 15. Financial support is not available from either the department or the University for students in this program.

MASTER OF ARTS IN TEACHING

The Master of Arts, Teaching degree is offered jointly by this department and the School of Education. The degree is intended for candidates who have a teaching credential and wish to strengthen their academic preparation. The program consists of a minimum of 25 units in the teaching field and 12 units in the School of Education. Detailed requirements are outlined in the “School of Education” section of this bulletin or may be obtained from the Admissions Director, School of Education.

TEACHING CREDENTIALS

For information concerning the requirements for teaching credentials, consult the “School of Education” section of this bulletin or address an inquiry to the Credential Administrator, School of Education.

DOCTOR OF PHILOSOPHY

For information on the University’s basic requirements for the Ph.D., see the “Graduate Degrees” section of this bulletin.

Preparation for Graduate Study—Students seeking entrance to graduate study in Biological Sciences ordinarily should have the equivalent of an undergraduate major in Biological Sciences at Stanford. However, students from other disciplines, particularly the physical sciences, are also encouraged to apply. Such students are advised at the time of initial registration on how they should complete background training during the first year of graduate study. In addition to the usual basic undergraduate courses in biology, it is recommended that preparation for graduate work include courses in chemistry through organic chemistry, general physics, and mathematics through calculus.

Application, Admission, and Financial Aid—Prospective graduate students should request application information, instructions, and materials from Graduate Admissions, the Registrar’s Office. The department’s program is divided into three separate tracks: Ecology/Evolution Biology, Integrative and Organismal, and Molecular/Cell Biology. Applications to the three tracks are evaluated separately; all applicants should specify the track which interests them. The deadline for receiving applications is December 15.

Scores on the general test and the advanced biology, biochemistry, cellular and molecular biology, or chemistry test of the Graduate Record Examination (GRE) are required. Applicants should plan on taking the GRE at least one month prior to the application deadline to insure that the official scores are available when applications are evaluated.

Competition for admission to the Ph.D. program is keen and in recent years it has been possible to offer admission to only 12 percent of the applicants.

Admitted students normally are offered financial support in the form of Stanford Presidential Graduate Fellowships, biology research assistantships, NIH traineeships, or Biological Sciences fellowships.

Qualified applicants should apply for predoctoral national competitive fellowships, especially those from the National Science Foundation and the Howard Hughes Medical Institute. Applicants to the Ph.D. program should consult their financial aid officers for information and applications.

General Departmental Requirements—An admitted applicant is required to fulfill the requirements of the University as outlined in the “Graduate Degrees” section of this bulletin and the department requirements stated below.

1. Teaching experience and training are part of the graduate curriculum. Each student assists in teaching one course in the department’s core lecture (41, 42, or 43) or lab courses (44X, 44Y), a second course that can be either a core course or central menu course, and a third department course recommended to be an advanced course in the student’s area of specialization.

2. Graduate seminars devoted to the discussion of current literature and research in particular fields of biology are an important means of attaining professional perspective and competence. Seminars are presented under individual course listings or are announced by the various research groups. A department seminar meets on most Mondays at 4 p.m. Topics of current biological interest are presented by speakers from Stanford and other institutions and are announced in the weekly Stanford Report. Graduate students are expected to attend.

3. Third Year and Beyond: each student must meet with the Advising Committee beginning the third year, and each year thereafter prior to the end of the Spring Quarter. The committee signs a form to ensure compliance. During Autumn Quarter of the fourth year, candidates must meet with their committee to evaluate the project and to discuss financial support, if required, beyond the fourth year. Advanced students are encouraged to meet with their committee at least twice a year.

Academic requirements for the three tracks are as follows:

Molecular/Cell Ph.D. Track Requirements—

1. First Year:

   a) Advising Committee: shortly after arrival, each entering student meets with the First-Year Advising Committee. The committee reviews the student’s previous academic work and current goals and advises the student on a program of Stanford courses, some of which may be required and others recommended. Satisfactory completion of the Core Curriculum (below) is required of all students.

   b) Core Curriculum: all students are required to take the following courses for a letter grade, unless previous course work has fulfilled these requirements.

      Biology 203: Advanced Genetics
      Biology 214: Cell Biology of Physiological Process
      Biochemistry 201: Advanced Molecular Biology

      A fourth course is selected from the student’s area of specialization.

   c) Lab Rotations: successful completion of rotations in three different laboratories is required of all first-year students. As lab space is limited, students with a definite interest in a particular lab should make arrangements as early as possible. Written petitions for exemptions to requirements “Core Curricula” and
2. Each student must pass a two-part qualifying exam.

Third Year and Beyond:

a) Area Proposal: the area proposal is a research proposal that lies within the student’s field of expertise, but is in an area other than that of the proposed dissertation research. The written proposal must be prepared in the same detail as a grant application, including references, plans for experiments, and discussion of the interpretation of possible experimental results. The written proposal must be turned in to the chair of the Graduate Studies Committee by the end of Autumn Quarter. Before the end of Winter Quarter, the student is examined orally on the contents of the written proposal and on general knowledge in the student’s projected field of expertise, including important cognate areas. The oral examination is administered by the Dissertation Advising Committee (consisting of the advisor and three other faculty members who have agreed to serve on the committee) and one representative from the Graduate Studies Committee. (Three to five representatives from the Graduate Studies Committee are chosen to be available for these committees.)

b) Dissertation Proposal: before the end of Spring Quarter of the second year, the student must prepare a dissertation proposal that outlines the student’s projected dissertation research. An expert assessment of the current literature is expected. After submission of the proposal to the Dissertation Advising Committee, an oral examination is held. The student’s advisor is not present at the examination, which is administered by the other members of the Dissertation Advising Committee and the Graduate Committee representative.

Advancement to candidacy is contingent on satisfactory completion of both proposals and oral exams. The deadline for completion is mid-May, before the annual faculty meeting devoted to evaluation of student progress. Failure to complete these requirements on schedule results in the withholding of the graduate stipend.

3. Third Year and Beyond:

a) Dissertation and Dissertation Defense: the finished dissertation must be turned in to the student’s Reading Committee at least one month before the oral exam is planned. The Reading Committee is comprised of at least three faculty members, two of whom must be Stanford Academic Council members, and is generally comprised of members who have served on the Oral Examination Committee. At least three weeks before the oral exam, the student checks in with the committee and must incorporate any changes they require by the time of the exam. The exam cannot be formally scheduled or publicly announced until that time. Evaluation is in written form by two faculty members.

b) First-Year Paper: each student must prepare and submit a paper, before the end of Spring Quarter their first year, that is evaluated by the advising committee. This paper should be a step toward the development of a dissertation proposal and may consist of an analysis of new data or a literature review and synthesis. Evaluation is in written form by two faculty members.

2. Second Year: the student is expected to write a major dissertation proposal. The proposal is evaluated by a committee of three faculty (the Dissertation Advising Committee) in an oral presentation. This is to be completed by the end of Spring Quarter of the second year. Advancement to candidacy depends on satisfactory completion of the dissertation proposal. Failure to complete these requirements on schedule results in the withholding of the graduate stipend.

3. Third Year and Beyond:

a) Dissertation and Dissertation Defense: at least one month before the oral exam takes place, the student must submit his or her dissertation to the Dissertation Advising Committee, which then becomes the Dissertation Reading Committee. At least two weeks before the oral exam, the student must incorporate into the dissertation any changes required by the committee. The exam cannot be formally scheduled or publicly announced until that time.

Ecology/Evolution Ph.D. Track Requirements—

1. First Year: each entering student is assigned a supervisory committee of three faculty members whose function is to develop an appropriate schedule of required and recommended courses and to meet once each quarter with the student during the first year.

a) All students are required to take Bio. 306: Current Topics in Integrative and Organismal Biology. Students specializing in integrative biology may also be asked to take appropriate graduate-level courses such as Developmental Biology 210; Molecular and Cellular Physiology 215; Neurobiology 200, 216, 230; or Psychology 228.

b) First-Year Paper: each student must prepare and submit a paper, before the end of Spring Quarter their first year, that is evaluated by the advising committee. This paper should be a step toward the development of a dissertation proposal and may consist of an analysis of new data or a literature review and synthesis. Evaluation is in written form by two faculty members.
COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

Additional courses not listed here are frequently offered by selected postdoctoral or advanced Ph.D. personnel in the areas of their special research competence. They are listed in the quarterly Time Schedule, with course descriptions available in the Student Services office.

INTRODUCTORY

2. Current Research Topics in Biological Sciences—Primarily for sophomores, enrollment limited to prospective and declared Biological Sciences majors. Weekly seminars by faculty on current research in biological sciences. Molecular biology and genetics; theory and mathematics in biology; ecology, physiology, and the environment; molecular and cellular aspects of neurobiology, immunology, and developmental biology; biological chemistry; behavioral biology; evolution.

9S. Introduction to Genetics—The basic principles and concepts of genetics at the classical, molecular, and population levels. Topics: mendelian genetics, cytogenetics, gene mapping, prokaryotic genetics, DNA structure and replication, transcription and translation, mutagenesis and DNA repair, recombinant DNA technology, genomics, regulation of gene expression, and population genetics. Model organisms used in genetic research; human examples when appropriate. Emphasis is on genetic analysis, including problem-solving.

3 units, Win (Black)

STANFORD INTRODUCTORY SEMINARS

Enrollment in seminars 11 through 37 are either open primarily to freshmen or sophomores. See http://www.stanford.edu/group/introsems/ for applications or more information.

11N. Stanford Introductory Seminar: Biotechnology in Everyday Life—Preference to freshmen. The science making transgenic plants and animals possible. Current and future applications of biotechnology, and the ethical issues raised. GER:2a (DR:5)

3 units, Sum (Fowler)

12N. Stanford Introductory Seminar: The Origin of Species—Preference to freshmen. Close reading of Darwin’s Origin of Species and additional secondary sources. Focus is on the logic of Darwin’s argument (what was the best evidence for evolution at the time the book was written?). What were the weakest points and missing pieces? How does each chapter contribute to the overall argument? How was Darwin’s thinking influenced by social conditions in his day? Oral presentations and a paper required. GER:2a (DR:5)

3 units, Aut (Walbot)

13N. Stanford Introductory Seminar: Environmental Problems and Solutions—Preference to freshmen. Students do independent investigations of current environmental problems, analyzing differing views of them and discussing possible solutions. Each student gives two seminar presentations and leads two seminar discussions. Short, documented position papers are written for policy-makers. GER:2a (DR:5)

3 units, Spr (Ehrlich)

14N. Stanford Introductory Seminar: Plants and Civilization—Preference to freshmen. Lectures, readings, and discussions on the role of plants in the development of civilization. Topics: the use of forests, woodlands, and grazing lands; centers of origins and spread of crops; the development of grains and fruits; viticulture; the spice route; the use of plants as medicine; fungi in human affairs; the global spread of weeds; engineering plants for the future. GER:2a (DR:5)

3 units, Spr (Mooney)

15N. Stanford Introductory Seminar: Environmental Literacy—Preference to freshmen. Lack of public understanding of the details of most environmental problems is cited as a cause of environmental deterioration. Good citizenship requires literacy about the elements of the scientific and decision making processes that accompany most environmental issues: what can happen, what are the odds, how can the credibility of various sources of expertise for the above be assessed, what components of several examples of environmental debates deal with factual and theoretical issues, and which are the political value judgments? Student-led discussions, student peer review and revised term papers, and oral paper presentation. GER:2a (DR:5)

3 units (Schneider) alternate years, given 2001-02

16N. Stanford Introductory Seminar: Island Ecology—Preference to freshmen. Introduction and illustration of the ways that ecologists think about the world. Focus is on the Hawaiian Islands: their origin, geology, climate, the evolution and ecology of their flora and fauna, and the distribution and functioning of Hawaiian ecosystems. The reasons for the concentration of threatened and endangered species in Hawaii, the scientific basis for their protection and recovery. The ways in which knowledge of island ecosystems can contribute to ecology and conservation biology on continents. GER:2a (DR:5)

3 units, Win (Vitousek) alternate years, not given 2001-02

18N. Stanford Introductory Seminar: Plant Genetic Engineering—Preference to freshmen. Flavr-Savr tomatoes, Round-Up Ready soybeans, plastic plants. Lectures, readings, and discussions about genetically modified plants. A survey of crop modifications that have been made or are currently in development. Discussions of the scientific basis of genetic engineering in plants and its social, economic, and environmental consequences. Oral presentations and short term papers. GER:2a (DR:5)

3 units, C. Somerville, S. Somerville not given 2000-01

19N. Stanford Introductory Seminar: Sex and Gender—An Evolutionary Perspective—Preference to freshmen. Themes: the feminist literature on gender and its social construction, mathematical theory for the evolution of sexual reproduction, and case studies of gender characteristics among animals and plants. Evolutionary studies from biology contribute to the understanding of gender, a topic mostly considered in the humanities and social sciences. Readings/discussion, term paper, computer programming. GER:4c (DR:1)

3 units, Win (Roughgarden)

21N. Stanford Introductory Seminar: Infection and Immunity—Preference to freshmen. The causes and prevention of infectious diseases, focusing on the interplay between pathogens and the immune system that determines the outcome of the disease. The basic principles of microbiology, immunology, and epidemiology. Discussion of diseases of the past and present (including AIDS, TB, and malaria); the roles of geographical, societal, and biological factors in disease emergence, spread, and prevention. Primary scientific literature, student-led discussions, and written reports. Prerequisite: good biology background, AP biology or introductory college biology (41 or 42, or Human Biology 2A, 3A).

3 units, Aut (Baker) alternate years, not given 2001-02

22N. Stanford Introductory Seminar: Maintenance of the Genome—Preference to freshmen. The blueprint for life is entrusted to the DNA molecules in all living cells. Focus is on the systems that scan the cellular DNA for alterations and then make repairs to ensure genomic stability in the face of natural endogenous threats to DNA and due to radiation and chemicals in the external environment. Redundancy of the genetic message ensured by the complementary DNA strands in the double helix
facilitates the recovery of information through excision repair when one of the strands is damaged, or when incorrect base pairings or small loops of unpaired bases occur. The predisposition to cancer involves a defect in DNA repair. New mechanistic understandings and their indications have made DNA repair important for investigations in oncology, aging, developmental biology, environmental health, and neurobiology. GER:2a (DR:5)
3 units, Spr (Hanawalt)

27N. Stanford Introductory Seminar: Nature and Nurture in Brain Development—Preference to freshmen. The brain consists of billions of neurons that are precisely interconnected in circuits that ultimately underlie our ability to think, behave, and perceive the world around us. During development, these neurons are born, migrate into position, and extend axons over long distances in order to contact appropriate target cells, wiring themselves into a particular circuit. The wiring of the brain is influenced by innate, genetically-driven processes and by our life experiences. The biological mechanisms that guide the development of neuronal circuits in animal model systems and humans. The relative influences of nature and nurture on neural development. Readings from the primary scientific literature focus student discussions. Corequisite: 42.
3 units (McConnell) alternate years given 2001-02

29N. Stanford Introductory Seminar: The Outer Limits of Life—Preference to freshmen. Introduction to the diversity of microbial life, emphasizing microbes that define the biochemical limits of life and which have unique life histories. Topics: microbial evolution and early life; life at extremes of temperature, pH, salinity, radiation, and pressure; microbial life deep in the earth’s crust; life without oxygen; intimate associations between microbes and other organisms; applications of microbial diversity research in engineering, medicine, and astrobiology. Discussion, oral presentation, and short term paper. GER:2a (DR:5)
3 units, Spr (Bohanan)

37Q. Stanford Introductory Seminar: Evolution in Action—Preference to sophomores; companion course for those who are taking the Biology core. The study of natural selection: how can we find out whether evolution is occurring now in a natural population; based on a long-term study by Peter and Rosemary Grant of natural selection in the Darwin finches of the Galapagos Islands, finches which were also important to Darwin’s formulation of the idea of evolution by natural selection. Readings in a popular account of the study and research of evolution by natural selection. Student research project; field trip to the California Academy of Sciences in San Francisco to look at specimens of finches. Goal is to develop ideas about what natural selection is and how it is studied empirically by ecologists. Corequisite: 43.
3 units, Aut (Gordon)

CORE

41,42,43. Principles of Biology—Comprehensive study of the principles of modern biological sciences, taken in sequence, preferably in the sophomore year. Biology majors must take for a letter grade. Prerequisites: Chemistry 31 (or 32), 33, 35; Mathematics 19, 20, 21, or 41, 42.

41. Evolution, Genetics, Genomes and Biochemistry—Topics: the diversity of life and macroevolution; structural and molecular genetics; biochemical principles emphasizing macromolecules (proteins, lipids, carbohydrates, and nucleic acids) and how their structure relates to function and to higher order assembly; genome structure and dynamics.
5 units, Aut (Long, Simon, Simoni, Watt)

42. Molecular Cell Biology, Developmental Biology, and Neurobiology—Topics: gene expression from transcription to translation; cell structure and function; basic concepts in determination, differentiation, and morphogenesis; neurobiology from cellular and developmental to neural regulation of physiology.
5 units, Win (Cyert, Long, Luo, Sapolsky)

43. Physiology, Ecology, and Behavioral Biology—Topics: physiology; immunology; the principles underlying the exchanges of mass and energy between organisms and their environments; the organ system specializations, which utilize these principles in adapting organisms to different environments; mechanisms by which the function of each system is controlled and regulated; behavioral, population, community, and ecosystem ecology; populations, evolution, and global change.
5 units, Spr (Vitousek, Gordon, Heller, Jones, Ray)

44X, Y. Core Experimental Laboratory—Two quarters of lab projects provide a working familiarity with the concepts, organisms, and techniques of modern biological research. Emphasis is on experimental design, analysis of data, and written and oral presentation of the experiments. Lab fee. Prerequisites: Chemistry 31, 33. Recommended: Biological Sciences or Human Biology core and statistics; 44X and Y should be taken sequentially in same year. (WIM)
44X. 4 units, Win (Malladi, Yelton)
44Y. 4 units, Spr (Malladi, Yelton)

96A,B. Jasper Ridge Biological Preserve Docent Training Program—Multidisciplinary environmental education class with hands on experience and exposure to field research. The natural history of plants and animals, ecology, archaeology, geology, land management, and active research projects of the preserve are presented by experts and staff. Two-quarter preparation for Stanford and community students to join the community education program. Participants are required to lead interpretive tours as docents and participate in continuing education classes available to members of the JRBP community after preparation.
2 units, Win, Spr (Vitousek)

INTERMEDIATE UNDERGRADUATE AND GRADUATE

106Z. Man-Environment Interactions: Case Studies from Central Chile—(Enroll in Overseas Studies 106H.)
5 5 units, Aut (Hajek)

110. Vertebrate Biology—(Enroll in Human Biology 110.)
3-4 units, Spr (Porzig)

110L. Vertebrate Biology Lab—(Enroll in Human Biology 110L.)
3 units, Spr (Porzig)

112/212. Human Physiology—The functioning of organ systems, emphasizing mechanisms of control and regulation. Topics: structure and function of endocrine and central nervous systems, cardiovascular physiology, respiration, salt and water balance, exercise and gastrointestinal physiology. Lectures/discussion. Prerequisite: Biological Sciences or Human Biology core.
4 units (Heller, Harris) alternate years, given 2001-02

117. Biology and Global Change—(Same as Earth Systems 111.) The biological causes and consequences of anthropogenic and natural changes in the atmosphere, oceans, and terrestrial and freshwater ecosystems. Topics: glacial cycles and marine circulation, greenhouse gases and climate change, tropical deforestation and species extinctions, and human population growth and resource use. Prerequisites: Biological Sciences or Human Biology core or graduate standing in any department.
3 units, Win (Matson, Vitousek, Mooney)

118. Genetic Analysis of Biological Processes—Basic genetic principles and their experimental applications. Emphasis is on the identification and use of mutations to study cellular function. Prerequisite: Biology core.
5 units, Spr (Baker)

121. Biogeography—Global distributions of organisms through the Phanerozoic, with emphasis on historical causes. Topics: plate tectonics,
124. Plant Physiological Ecology: From Leaf to Globe—A functional approach to understanding terrestrial vegetation. Prerequisites: 51, 53 or 42, 43; or consent of instructor.

3 units (Mooney, Berry, Field) alternate years, given 2001-02

125. Ecosystems of California—The principles of ecosystem functions, with emphasis on the vegetation components and on California systems. Prerequisite: 51, or Human Biology 2A.

3-4 units, Spr (Mooney)

126. Cell Biology: Molecular Organization—The biochemistry and biophysics of macromolecules, emphasizing how macromolecules interact to form complex cellular structures. Topics: protein biosynthesis and folding, structure assembly and functions of biological membranes, and mechanisms of membrane trafficking. Experimental logic and critical interpretation of experimental data. Prerequisite: Biological Sciences core.

4 units, Win (Kopito, Frydman)

127. Cell Biology: Cellular Dynamics—The principles of eukaryotic cellular function, emphasizing how cellular structures carry out important cell processes. Topics: cell cycle, mitosis, cytoskeleton and cell motility, cell-cell interactions, and signal transduction. Experimental logic and interpretation of experimental results. Prerequisite: Biological Sciences core.

4 units, Spr (Stearns, Nelson)

128. Algae/Fungi—Introduction to these groups, their utilization in molecular biology in studying biological problems, and their ecological significance. Lectures, lab, field trips. Prerequisite: Biological Sciences core or consent of instructor.

4 units (Grossman) alternate years, given 2001-02

129. Developmental Genetics—The uses of the tools of modern genetics to understand outstanding questions in developmental biology.

3 units (Baker) alternate years, given 2001-02

130. Genetics of Prokaryotes—Analysis of prokaryotic genes and genomes with emphasis on the evolution of genetic systems. Prerequisite: 41 or 52.

3 units, Aut (Campbell)

131. Replication of DNA—Modes of DNA replication and their control in prokaryotic and eukaryotic systems. Emphasis is on experimental approaches and their limitations. Critical review of current literature in seminar format. Lectures and student reports on specialized topics. Enrollment limited to 14 advanced undergraduates. Prerequisites: 41 or 52 and/or consent of instructor.

3 units (Hanawalt) not given 2000-01

132. Evolutionary Paleobiology—A paleontological approach to evolutionary theory. Topics: history of life, speciation, heterochrony, evolutionary constraint, coevolution, macroevolution, the Cambrian Explosion, mass extinctions, taphonomy, life on land, life in the sea, life in the air.

4 units, Win (Hadly)

133. Plant Genetics—Gene analysis, mutagenesis, and transposable elements; developmental genetics of flowering and embryo development; biochemical genetics of plant metabolism; lessons from transgenic plant studies. Prerequisites: 41,42,43 or 51,52,52, or consent of the instructor.

3 units (Walbot) alternate years, given 2001-02

134. Ecology and Evolution of Plants—Introduction to the basic principles of ecology and evolutionary biology, focusing on plants. Topics: plants in the environment, population dynamics, natural selection in plant populations, the origin and maintenance of diversity, speciation, extinction, conservation of plant populations. Limited enrollment, lab with field trips and independent projects. Prerequisite: 43 or 51, or consent of the instructor. Recommended: statistics.

3-5 units (Ackerly) alternate years, given 2001-02

135. Biology of Birds—the ways birds interact with their environments and each other, emphasizing studies that had impact in the fields of population biology, community ecology, and evolution. Students become familiar with local bird communities; emphasis is on field research. One one-hour lecture and one three to five hour lecture or field trip per week. Enrollment limited to 20. Prerequisites: 43 or 51 or equivalent, and consent of instructor. Recommended: birding experience.

3 units (Ehrlich) alternate years, given 2001-02

136. Principles of Ecology—(Graduate students register for 242; same as Geophysics 142.) Introduction to ecology, emphasizing ecological theory and the population and community scales of organization, using primarily zoological examples. Evolutionary processes in ecology. Prerequisites: first-year calculus (Mathematics 19-21 or higher). Recommended: 43 or 51.

4-5 units, Win (Feldman)

137. Controlling Climate Change in the 21st Century—(Same as Human Biology 147.) The science, economics, and environmental diplomacy of global climate change. Topics: the science of climate change, climate change and global environmental law; global economic approaches to carbon abatement, taxes, and tradable permits; joint implementation, consensus, and division in the European Union; gaining the support of China, other developing countries, and U.S. corporations; alternative energy and energy efficiencies for less carbon-intensive electric power and transport. Enrollment limited to 12 seniors.

3 units, Aut (Schneider, Rosencranz)
148. Colloquium on Biosystematics and Evolution—Panel discussion and outside speakers cover diverse topics of current interest in the systematics and evolution of living diversity; sponsored jointly with the California Academy of Sciences.

1 unit, Win (Wait) alternate years, not given 2001-02

150/250. Human Behavioral Biology—(Graduate students register for 250.) The biological basis of normal and abnormal human behavior is examined to train students in approaching complex behaviors in a multidisciplinary way. Relevant disparate disciplines (sociobiology, ethology, neuroscience, and endocrinology) are integrated in the examination of behaviors such as aggression, sexual behavior, language use, mental illness.

6 units (Sapolsky) alternate years; given 2001-02

151. Mechanisms of Neuron Death—Open to Biology majors with a strong background in neuroscience. Seminar on the cell and molecular biology of neuron death during neurological disease. Topics: the amyloid diseases (Alzheimer's), prion diseases (kuru and Creutzfeld-Jacob), oxygen radical diseases (Parkinson's and ALS), triplet repeat diseases (Huntington's), and AIDS-related dementia. Lectures, discussions, and student presentations. Enrollment limited to 16.

3 units (Sapolsky)

153. Cellular Neuroscience: Cell Signaling and Behavior—(Enroll in Psychology 120.)

4 units, Aut (Wine)

154/254. Molecular and Cellular Neurobiology—(Graduate students register for 254; same as Neurobiology 254.) Lecture/seminar for advanced undergraduates and graduate students, focusing on cellular and molecular mechanisms in the organization and functions of the nervous system. Topics: cell biology of the neuron, wiring of the neuronal network, synapse structure and synaptic transmission, signal transduction in the nervous system, molecular basis of behavior including learning and memory, molecular pathogenesis of neurological diseases. Prerequisite for undergraduates: Biological Sciences core or equivalent, plus at least one of 118, 128, 129, or 153, or consent of the instructors. 4 units, Aut (Luo, Schulman)

158. Developmental Neurobiology—Lecture/seminar for advanced undergraduates and coterminus master's students. The principles of nervous system development from the molecular control of patterning, cell-cell interactions, and trophic factors to the level of neural systems and the role of experience in influencing brain structure and function. Topics: neural induction and patterning cell lineage, neurogenesis, neuronal migration, axonal pathfinding, synapse elimination, the role of activity, critical periods, and the development of behavior. Enrollment limited to 75. Prerequisites: 42 or 53 or equivalent; and 153 or Neurobiology 200, or consent of instructor.

4 units, Spr (McConnell) alternate years, not given 2001-02

184/284. Principles and Practice of Biosystematics—The basic principles and major operating procedures of systematic biology; the study of the classification of organisms and of the relationships among them. Concepts and issues common to the study of all organisms; examples from particular groups of creatures.

4 units, Spr (Watt, Gosliner, Jablonski, Ackerly) alternate years, not given 2001-02

HOPKINS MARINE STATION

Note that several of these courses can be used to fulfill department menu requirements and that completion of the Biological Sciences core is a prerequisite for all of these courses. For course descriptions, see the "Hopkins Marine Station" section of this bulletin.

56H. Seminar: History and Philosophy of Science

2 units (Somero) alternate years, given 2001-02
UNIVERSITY, INVOLVING INDIVIDUAL WORK

Students majoring in Biological Sciences are encouraged to pursue directed reading and research opportunities. An introduction to research is provided by Bio. 2.

191. Research in Bird Biology—Semi-independent field research in ornithology, emphasizing ecological relationships. Projects involve research, planned and carried out by the student in consultation with the instructor. Results are written in publication format. Enrollment limited. Prerequisites: 43 or 51, concurrent or subsequent enrollment in 139, and consent of instructor.

3 units, Win, Spr (Ehrlich)

1 unit, Aut, Win, Spr (Black)

194/294. Seminar in Environmental Policy Research—Principles of and current problems in environmental policy. Lectures, student presentations, and intensive library research or participation in group research project required. May be repeated for credit. Prerequisite: consent of instructor.

3 units (Ehrlich) alternate years, given 2001-02

198. Directed Instruction/Reading—May be taken as a prelude to research. Read/discuss biology-related literature with a faculty sponsor, possible participation in a lab or research group seminars, and library research. Credit for work arranged with out-of-department instructors is restricted to Biological Sciences majors and requires department approval. See http://www.stanford.edu/dept/biology/undergrad/honors/Research and Honors under “Research Courses” for information on research sponsors, units, petition instructions, deadlines, credit for summer research, and out-of-Stanford research, or email kblack@leland for more information.

198H. Directed Instruction/Reading—For work done under supervision of Hopkins Marine Station faculty.

199. Undergraduate Research—Individual research taken by arrangement with in-department or out-of-department instructors. Credit for work arranged with out-of-department instructors is restricted to Biological Sciences majors and requires department approval. See http://www.stanford.edu/dept/biology/undergrad/honors/Research and Honors under “Research Courses” for information on research sponsors, units, petition instructions, deadlines, credit for summer research, and out-of-Stanford research, or email kblack@leland for more information.

199H. Undergraduate Research—For undergraduate research done under supervision of Hopkins Marine Station faculty.

ADVANCED UNDERGRADUATE AND GRADUATE

203. Advanced Genetics—(Same as Genetics 203.) Explores the genetic toolbox. Examples of analytic methods and modern synthetic genetic manipulation, including original papers. Emphasis is on use of genetic tools in dissecting complex biological pathways, developmental processes, and regulatory systems. Graduate students in biological sciences welcome; those with minimal experience in genetics should prepare themselves by working out problems in Suzuki, et al, or Hartl, et al.

4 units, Aut (Botstein, Kim, Stearns, Villeneuve, Sidow)

205. DNA Repair and Mutagenesis—Interactions of endogenous and environmental mutagens with DNA. Responses of living systems to damaged DNA, including molecular mechanisms for DNA repair and recombinational modes. Inducible repair responses and “error-prone” mechanisms. Human hereditary deficiencies in DNA repair that predispose to cancer. The relationships of DNA repair to mutagenesis and carcinogenesis. Lectures/discussion of selected topics and review of current research literature. Prerequisites: 41 or 52, 118, and/or consent of instructor.

3 units, Win (Hanawalt)

207. The Life and Death of Proteins—How proteins are made and degraded in the cell. Critical reading/discussion of primary literature. Selected “case studies” follow the evolution of scientific ideas, and evaluate how different experimental approaches can contribute to our understanding of a biological problem. Topics: protein folding and assembly, mechanisms of chaperone action, sorting into organelles and the ubiquitin-proteasome pathway. Enrollment limited to 20.

3 units (Frydman) alternate years, given 2001-02

208. Developmental Biology—(Enroll in Developmental Biology 210.)

5 units, Spr (Fuller, Crabtree, Stuart Kimm, Kingsley, Nusslein-Volhard, Scott, Seung Kim, Tauber)

209. Advanced Neurosciences Laboratory—The use of equipment and techniques required to record and analyze extracellular and intracellular activity in vertebrates, or other state-of-the-art neuroscience techniques. In-depth training in a subset of these techniques as applied to a specific research project. Students present/critically evaluate representative neuroscience methodologies in weekly discussion groups. Enrollment limited to 10; admission by application (available in Student Services office). Prerequisites: Biological Sciences or Human Biology core sequence and core lab (44 or equivalent). Recommended: some advanced course work in neurobiology.

4 units, Win (Heller, Grahn)

211. Biophysics of Sensory Transduction—The diverse mechanisms, neural and aural, that organisms have evolved to detect physical cues from the environment. Sensory topics: vision, hearing, taste, olfaction, chemoreception, mechanoreception, electromagnetic sensing, and other modalities. Emphasis is on common and/or emergent biophysical themes, e.g., sensitivity, amplification, encoding, adaptation, and the molecular basis of cellular signaling. Lectures and student-led presentations cover interdisciplinary aspects of biology and physics. Prerequisites: familiarity with undergraduate physics (with calculus) and basic biology.

4 units, Win (Heller, Grahn)

213. Viruses—Principles of virus growth, genetics, architecture, and assembly. The relation of temperate viruses and other episomes to the host cell. Prerequisite: 41 or 52. Recommended: 118.

3 units, Win (Campbell)

214. Cell Biology of Physiological Processes—(Same as Molecular and Cellular Physiology 221.) The basic mechanisms of membrane and cellular biogenesis in relation to physiological processes. Emphasis is on the regulatory and signaling mechanisms involved in coordinating complex cellular phenomena, such as cellular organization, function, and differentiation. Topics: cellular compartmentalization, transport and trafficking of macromolecules, organelle biogenesis, cell division, motility and adhesion, and multicellularity. Must be taken concurrently with 214A-H. Prerequisites: Biological Sciences core, Biochemistry 201.

4 units, Win (Rexach, Nelson, Frydman, Jackson, Theriot, Fang)

214A, B, C, D, E, F, G, H. Cell Biology of Physiological Processes—(Same as Molecular and Cellular Physiology 221A-H.) Required course taken with 211, taught by medical school faculty. Meant to expand on the topics covered in 214. Students must register for only one section. Prerequisites: Biological Sciences core, Biochemistry 201.

2 units, Win (Staff)

215. Biochemical Evolution—Lectures/discussion covering the biochemical viewpoints on diverse aspects of the evolutionary process. Topics: prebiotic biochemistry and the origins of life; adaptive organiza-
tional lectures that meet jointly with 158. See 158.

216. Ecosystem Ecology and Global Biogeochemistry—Nutrient cycling and the regulation of primary and secondary production in terrestrial, freshwater, and marine ecosystems; land-water and biosphere-atmosphere interactions; global element cycles and their regulation; human effects on biogeochemical cycles. Prerequisite: graduate standing in science or engineering; consent for undergraduates or coterminal students.

3 units, Spr (Vitousek) alternate years, not given 2001-02

217. Climate Theory, Modeling, Applications, and Implications—The history of the coevolution of climate and life. Theories of climate, external and internal climatic forcings, definitions of climate and the climate system, and the rationale for climatic modeling. Hierarchy of climatic models; interactions among atmosphere, biosphere, oceans, hydrosphere, and cryosphere. Climatic predictability; implications of predictions and relevance to current controversies. Prerequisites: Biological Sciences core or Civil and Environmental Engineering 163, and math through differential equations, or consent of instructor.

3 units (Schneider) alternate years, given 2001-02

220. Ecology of Microorganisms—Interactions between microorganisms and their environments from an ecological and evolutionary perspective. Topics: nutrient acquisition and environmental sensing, behavioral ecology, growth of cells and populations, population interactions, communities, microbial biodiversity. Prerequisites: Biological Sciences core or equivalent, or consent of instructor. Recommended: 133, 142.

3 units, Win (Bohannan)

230. Molecular and Cellular Immunology—For graduate students and advanced undergraduates. The basic components of the immune system: structure and functions of antibody molecules; cellular basis of immunity and its regulation; molecular biology and biochemistry of antigen recognition structures and signaling pathways; genetics of immunity and disease susceptibility. Emphasis is on key experimental approaches that have advanced our understanding. Prerequisites for undergraduates: Biological Sciences or a Human Biology core, or consent of instructor.

4 units, Aut (Jones)

237. Introduction to Biotechnology—(Enroll in Chemical Engineering 450.)

3 units, Spr (Robertson, Swartz)

249. Neural Basis of Sleep and Circadian Rhythms—How the activity of the brain is affected by changes in the sleep/wake state. The neurochemistry of changes in brain activity and conscious awareness associated with changes in the sleep/wake state. Behavioral and neurobiological phenomena of sleep homeostasis, REM-sleep regulation, circadian rhythms, hibernation, and anesthesia. Enrollment limited to 30. Prerequisite: basic understanding of the nervous system (at least one of 42 or 53, Human Biology 4A, Psychology 70, or consent of instructor).

4 units, Aut (Heller, Edgar) alternate years, not given 2001-02

256. Plant Physiology—The physiological functions of land plants from analytical and quantitative points of view: photosynthetic energy and gas exchange; water and photosynthetic long-distance transport; mineral nutrient ion uptake and transport; growth at cellular and organismal levels, and its hormonal regulation; responses to light, gravity, temperature, etc. Prerequisite: Biological Sciences core.

4 units, Win (Ray)

258. Neural Development—Seminar for graduate students, with optional lectures that meet jointly with 158. See 158.

4 units, Spr (McConnell) alternate years, not given 2001-02

274A. Environmental Microbiology I—(Enroll in Civil and Environmental Engineering 274A.)

3 units, Aut (Spormann)

274B. Environmental Microbiology II—(Enroll in Civil and Environmental Engineering 274B.)

3 units, Win (Spormann)

274C. Environmental Microbiology Laboratory—(Enroll in Civil and Environmental Engineering 274C.)

3 units, Spr (Spormann)

283. Theoretical Population Genetics—Detailed survey of models in population genetics. Selection, random drift, gene linkage, migration, and inbreeding, and the influence they have on the evolution of gene frequencies and chromosome structure. Models are related to DNA sequence evolution. Prerequisite: consent of instructor.

3 units, Aut (Feldman)

290. Teaching of Biological Science—Open to upper-division undergraduates and graduate students. Practical experience in teaching lab biology or serving as an assistant in a lecture course. Prerequisite: consent of instructor.

1-5 units, Aut, Win, Spr (Staff)

291. Development and Teaching of Core Experimental Laboratories—Preparation for teaching the core experimental courses (44X and 44Y). Emphasis is on lab, speaking, and writing skills. Focus is on updating the lab to meet the changing technical needs of the students. Must be taken prior to teaching either of the above courses. Prerequisite: selection by instructor.

2 units, Aut, Win (Mailardi, Yelton)

PRIMARY FOR GRADUATE STUDENTS

300. Research—For graduate students only. Individual research taken by arrangement with in-department or out-of-department instructors. Master's students: credit for work arranged with out-of-department instructors is restricted to Biological Sciences students and requires an approved department petition. See http://www.stanford.edu/dept/biology/undergrad/honors/, Research and Honors under "Research Courses" for information on research sponsors, units, petition instructions, deadlines, credit for summer research, and out-of-Stanford research, or email kblack@leland for more information.

300H. Research—For graduate research done under supervision of Hopkins Marine Station faculty.

301. Current Topics in Molecular, Cell, Developmental, Genetics, and Integration Biology—Enrollment limited to Biological Sciences Ph.D. students in the first year of graduate study. Lectures in areas of the faculty's current research interests.

1 unit, Aut (Staff)

302, 303, 304. Current Topics in Ecology and Evolution—Required of first-year graduate students in population biology and open to all graduate students. Discussion of the major conceptual issues and developing topics in population biology.

302. 1 unit, Aut (Bohannan)

303. 1 unit, Win (Bohannan)

304. 1 unit, Spr (Bohannan)

303. Concepts in Ecology and Evolution—Required of first-year graduate students in population biology and open to all graduate students. Discussion of the major conceptual issues and developing topics in population biology.

1 unit, Win (Bohannan)

304. Concepts in Ecology and Evolution—Required of first-year graduate students in population biology and open to all graduate students.
Discussion of the major conceptual issues and developing topics in population biology.

1 unit, Spr (Bohannan)

305. Seminar on DNA Repair and Genetic Toxicology—Enrollment limited to graduate students and advanced undergraduate students doing research in this field. Literature review and discussion of current research, emphasizing experimental approaches for studying DNA damage processing in bacteria, yeast, and mammalian cells. Prerequisite: consent of instructor.

1-3 units, Aut, Win, Spr (Hanawalt)

306. Current Topics in Integrative Organismal Biology—Enrollment limited to graduate students doing research in this field.

1 unit, Aut (Staff)

307. Seminar in Microbial Ecology and Evolution—Discussion of recent and classical research papers in microbial ecology and evolution, and presentation of research in progress by participants. Prerequisite: consent of instructor.

1 unit, Aut, Win, Spr (Bohannan)

315. Seminar in Biochemical Evolution—Literature review and discussion of current topics in biochemical evolution and molecular evolutionary genetics. Prerequisite: consent of instructor.

1-3 units, qtr. by arrangement (Watt)

333. Seminar in Evolutionary Ecology—Literature review and research discussion on a selected topic in ecology and evolution. Student participation required. Prerequisite: consent of instructor.

1-3 units, Spr (Ackerly) alternate years, not given 2001-02

3 units, Spr (Mooney, Berry, Field)

alternate years, not given 2001-02

342. Plant Biology Seminar—Topics announced at the beginning of each quarter. In-depth coverage of the current literature.

1 unit, Spr (Walbot, Berry, Bjorkman, Briggs, Grossman, Hoffman, Long, Mooney, Ray, Vitousek)

346. Advanced Seminar in Molecular Microbiology—Enrollment limited to graduate students directly associated with departmental research groups in genetics or molecular biology.

1-3 units, Aut, Win, Spr (Long, Campbell, Spormann, Grossman, Yanofsky)

383. Seminar in Population Genetics—Literature review and research discussion of current problems in the theory and practice of population genetics and molecular evolution. Student participation required. Prerequisite: consent of instructor.

1-3 units, Aut, Win, Spr (Feldman)

384. Seminar in Theoretical Ecology—(Same as Geophysics 185Y.) Discussions of recent and classical research papers in ecology, and presentation of work in progress by participants. Prerequisite: consent of instructor.

1-3 units, Spr (Roughgarden)

459. Frontiers in Interdisciplinary Biosciences—(Cross-listed in multiple departments in the schools of Humanities and Sciences, Engineering, and Medicine; students should enroll directly through their affiliated department, if at all possible.) Introduction to cutting-edge research involving interdisciplinary approaches to bioscience and biotechnology; for specialists and non-specialists. Associated with Stanford's Clark Center for interdisciplinary Bioscience, and held in conjunction with a seminar series meeting twice monthly during 2000-01. Leading investigators from Stanford and throughout the world speak on their research; students also meet separately to present and discuss the ever-changing subject matter, related literature, and future directions. Prerequisite: keen interest in all of science, with particular interest in life itself. Recommended: basic knowledge of biology, chemistry, and physics.

2 units, Aut, Win, Spr (S. Block)

DIVISION OF MARINE BIOLOGY
HOPKINS MARINE STATION

Emeritus: (Professor) John H. Phillips, Jr.; (Professor-Research) R. Paul Levine
Acting Director: George N. Somero
Professors: Mark W. Denny, David Epel, William F. Gilly, Dennis A. Powers, George N. Somero, Stuart H. Thompson
Associate Professor: Barbara A. Block
Assistant Professor: Fiorella Micheli
Lecturer: James M. Watanabe

The Hopkins Marine Station is at Pacific Grove, on the south side of Monterey Bay, 90 miles from the main University campus. The 11-acre grounds, on the main portion of Cabrillo Point, include a sheltered landing place and storage for small boats. Buildings include the Lawrence Blinks Laboratory, Alexander Agassiz Laboratory, Jacques Loeb Laboratory, Harold A. Miller Library, Monterey Boat Works, Walter K. Fisher Laboratory, Tuna Research and Conservation Center, and DeNault Family Research Building. The 15,000 volume library subscribes to approximately 450 journals, and its collections are particularly strong in embryology, marine biology, microbiology, and oceanography.

The station is open during the entire year and maintains a permanent staff of resident investigators and technical assistants. The staff is supplemented by visiting faculty members, especially during the summer. There are facilities for visiting investigators and for elementary and advanced instruction in biology. For further information, write Hopkins Marine Station, Pacific Grove, CA 93950.

COURSES

56H. Seminar: History and Philosophy of Science—The nature of scientific inquiry, its logic, historical patterns, and sociology. Emphasis is on the unique aspects of the biological sciences.

2 units (Somero) alternate years, given 2001-02

160H/260H. Comparative Animal Physiology—(Graduate students register for 260H.)

The structures and processes that control life at the cellular level. Topics: membrane structure and function, signal transduction, the cytoskeleton, transport processes, cell division, cell-cell interactions, and motility. Similar to Bio. 121 but using marine examples. Prerequisite: Biological Sciences core or consent of instructor.

4 units, Win (Epel)

161H/261H. Invertebrate Zoology—(Graduate students register for 261H.)

Survey of invertebrate diversity emphasizing form and function in a phylogenetic framework. Morphological diversity, life histories, physiology, and ecology of the major invertebrate groups, concentrating on local marine form examples. Current views on the phylogenetic relationships and evolution of the invertebrates. Lectures, lab, plus field trips. Prerequisite: Biological Sciences core or consent of instructor.

5 units, Win (Watanabe)

162H/262H. Comparative Animal Physiology—(Graduate students register for 262H.)

Physiological principles are examined using the diversity of solutions apparent in vertebrates and invertebrates, and focusing on how animals work. Topics: physiology of respiration, circulation, energy metabolism, thermoregulation, osmotic regulation,
muscle physiology, and locomotion. Labs introduce physiological measurements with animals, discussion sections emphasize current topics in evolutionary and ecological physiology. Prerequisite: Biological Sciences core.

5 units, Spr (Block) alternate years, not given 2001-02

163H/263H. Principles of Oceanic Biology—(Graduate students register for 263H.) How the physics and chemistry of the oceanic environment affect marine plants and animals. Topics: seawater and ocean circulation, separation of light and nutrients in the two-layered ocean, oceanic food webs and trophic interactions, oceanic ecosystems, biogeography, and global change. Lectures, discussion, and field trips. Recommended: Physics 21 or 51, Chemistry 31, Biological Sciences core, or consent of instructor.

4 units, Win (Somoero)

164H/264H. Marine Botany—(Graduate students register for 264H.) Introduction to plants in the sea. Phytoplankton and oceanic productivity; macrophytes and nearshore ecology; marine angiosperms from taxonomical, physiological, and ecological perspectives. Lectures, lab. Prerequisite: Biological Sciences core or consent of instructor.

4 units, Win (Staff) alternate years, not given 2001-02

165H/265H. Air and Water—(Graduate students register for 265H.) Introduction to environmental physics. The physical properties of life’s fluids compared and contrasted. How and why life has evolved differently on land than in water. Topics: density, viscosity, diffusion, thermal properties, sound, light, evaporation, and surface tension. Recommended: Physics 21, 23, or 51, 53; calculus; Biological Sciences core; or consent of instructor.

3 units, Spr (Denny) alternate years, not given 2001-02

166H/266H. Locomotion—(Graduate students register for 266H.) How animals and plants swim, crawl, run, and fly. The principles of fluid and solid mechanics determine the possibilities and limitations of organismal motion. Recommended: Physics 21 or 51, Biological Sciences core, or consent of instructor.

3 units (Denny) alternate years, given 2001-02

167H/267H. Nerve, Muscle, and Synapse—(Graduate students register for 267H.) Fundamental aspects of membrane excitability and conduction, synaptic transmission, and excitation-contraction coupling. Emphasis is on biophysical, molecular, and cellular level analyses of these processes in vertebrate and invertebrate systems. Labs on intra- and extracellular recording and patch clamp techniques. Lectures, discussions, and labs. Prerequisites: Physics 23, 28, 43, or equivalent; Chemistry 31, 135; calculus; or consent of instructor.

5 units, Win (Gilly)

168H/268H. Seminar: Cellular Signal Transduction—(Graduate students register for 268H.) Lecture/seminar, group discussions. Focus is on the physiology, biochemistry, and molecular biology of signaling cascades, from basic principles to advanced and current topics. Prerequisite: consent of instructor. (AU)

1 unit, Spr (Thompson)

169H/269H. Neurobiology and Behavior—(Graduate students register for 269H.) The neural mechanism responsible for generating animal behavior. Topics: neural excitability, synaptic plasticity, signal transduction, and neural circuits. Lectures, discussions, demonstrations, and lab. Prerequisite: Biological Sciences core or consent of instructor.

5 units, Win (Thompson)

170H/270H. Seminar: Topics in Marine Biology—(Graduate students register for 270H.) A specific topic of current interest to marine science is explored through discussion of the primary literature. Prerequisite: Biological Sciences core or consent of instructor.

1 unit, Win (Staff)

171H/271H. Ecological and Evolutionary Physiology—(Graduate students register for 271H.) The interplay between environmental factors (e.g., temperature, light, nutrient supply, salinity, and oxygen availability) and adaptive change at the physiological level. Emphasis is on marine species and the roles played by physiological adaptations in establishing their distribution and performance. Prerequisite: Biological Sciences core or consent of instructor.

4 units, Win (Somoero)

172H/272H. Marine Ecology—(Graduate students register for 272H.) Introduction to the principles of ecology as applied to life in the sea. Population dynamics, community ecology, and the effects of man on the oceans. Lectures, lab. Prerequisite: Biological Sciences core or consent of instructor.

5 units, Spr (Micheli)

173H/273H. Marine Conservation Biology—(Graduate students register for 273H.) Offered with the support of the Pew Conservation Trust. The science of preserving marine diversity and the major conservation issues associated with marine ecosystems. Topics: the decline of open fisheries, salmon conservation, bycatch issues in fisheries, the use of marine reserves, marine invasions and pollution, and global warming. Guest lecturers from other universities who specialize in marine conservation.

3 units (Block) alternate years, given 2001-02

174H/274H. Experimental Design and Probability—(Graduate students register for 274H.) Variability is an integral part of biology. Introduction to probability and its use in designing experiments to address biological problems. Focus is on analysis of variance, when and how to use it, why it works, and how to interpret the results. Design of complex, but practical, asymmetrical experiments and environmental impact studies, and regression and analysis of covariance. Computer-based data analysis. Prerequisite: Biological Sciences core or consent of instructor.

3 units, Spr (Watanabe)

175H. Problems in Marine Ecology and Ecophysiology—Field-based, emphasizing individual and small-group research for advanced undergraduates. Students learn field and laboratory techniques to address ecological, ecophysiological, and biomechanical problems faced by marine organisms. Original research projects may be integrated with ongoing research programs in the Hopkins Marine Life Refuge. Prerequisites: Biological Sciences core, consent of instructors.

8 units, Spr (Watanabe, Denny, Micheli, Somoero, Epel, Block)

176H. Experimental Neurobiology—Lab, emphasizing methods in the neurosciences, including electrophysiological, biochemical, molecular, behavioral, and histological techniques. Students work on individual original research projects under guidance of the faculty. Prerequisites: strong interest in neurobiology and previous relevant course work, consent of instructors.

8 units, Spr (Gilly, Thompson)

177H/277H. Seminar: Cell Physiology of Stress—(Graduate students register for 277H.) Organisms are constantly exposed to environmental stresses and potential cell damage. The nature of these stresses, adaptive defense mechanisms, and repair responses when these defenses break down. Emphasis is on stress responses to toxins, DNA damage, oxidative stress, and the signal transduction pathways involved in stress responses. Prerequisites: Biological Sciences core, consent of instructor.

2 units, Spr (Epel) alternate years, not given 2001-02

178H/278H. Seminar: Deep-Sea Biology—(Graduate students register for 278H.) The deep sea is the largest, but least understood, fraction of the biosphere. Organisms living in this huge space possess diverse adaptations to allow life under high pressure. Recent discoveries in deep-sea biology, including the biology of the hydrothermal vents, and the
technology that makes these advances possible. Prerequisites: Biological Sciences core, consent of instructor.

2 units, Spr (Somero) alternate years, not given 2001-02

198H. Directed Instruction/Reading—May be taken as a prelude to research and may also involve participation in a lab or research group seminar and/or library research. Credit for work arranged with out-of-department instructors restricted to Biological Sciences majors and requires department approval.

Aut, Win, Spr, Sum—both terms (Staff)

199H. Undergraduate Research—For experience in biological research, qualified undergraduate students may undertake individual work in the fields listed under 300H. Arrangements must be made by consultation or correspondence.

Aut, Win, Spr, Sum—both terms (Staff)

290H. Teaching of Biological Science—Open to upper-division undergraduates and graduate students. Practical experience in teaching lab biology or serving as an assistant in a lecture course. Prerequisite: consent of instructor.

1-5 units, Win, Spr, Sum (Staff)

300H. Research—Graduate study involving original work may be undertaken with members of the staff in the fields indicated:

B. Block: Comparative Vertebrate Physiology—biomechanics, metabolic physiology and phylogeny of pelagic fishes, evolution of echolocation.

M. Denny: Biomechanics—the mechanical properties of biological materials and their consequences for animal size, shape, and performance.

W. Gilly: Neurobiology—analysis of giant axon systems in marine invertebrates from molecular to behavioral levels.

R. P. Levine: Molecular Biology and Biochemistry of Biomineralization.

P. Micheli: Marine Ecology—ecosystems interactions and community ecology, scale-dependent aspects of community organization, marine conservation and design of multi-species marine protected areas, behavioral ecology.

G. Somero: Ecological and Evolutionary Physiology—adaptations of marine organisms to the environment: temperature, pressure, desiccation, and oxygen availability.

S. Thompson: Neurophysiology—neuronal control of behavior and mechanisms of ion permeation, signal transduction, calcium homeostasis, and neurotransmission.

J. Watanabe: Marine Ecology—kelp forest ecology and invertebrate zoology.

SUMMER PROGRAM

The summer program is open to all advanced undergraduate, graduate, and postdoctoral students, and to teachers whose biological backgrounds, teaching, or research activities can benefit from a summer’s study of marine life. Application blanks and further information may be obtained by writing to Hopkins Marine Station, Pacific Grove, CA 93950. Completed applications should be submitted by March 31. Applications received later are considered if space is still available.

The Summer Quarter is divided into two terms. It is possible to register for either term, or for the full quarter. Registration is possible for only one course during each term.

FIRST TERM

179H. Subtidal Communities—Lectures, lab, and field trips treating shallow water marine communities. Emphasis is on local habitats and the introduction of physical environmental parameters, community composition, aspects of the biology of constituent species, and methods for subtidal studies. Prerequisites: SCUBA certification, SCUBA equipment, ocean diving experience, and some background in biology.

6 units (Watanabe)

277H. Biomechanics and Ecological Physiology of Intertidal Communities—Introduction to the mechanical and physiological design of wave-swept organisms. How different abiotic stresses (wave exposure, wind speed, temperature, light) influence marine animals and plants, and adaptive responses to these stresses. Lab introduces methods for measuring environmental stress and organismal responses. Recommended: background in algology, intertidal ecology, or invertebrate zoology; basic physics and calculus.

4 units (Denny, Somero) alternate years, not given 2001-02

SECOND TERM

180H/280H. Problems in Subtidal Ecology—Graduate students register for 280H. Group and individual research projects focus on shallow water marine communities, emphasizing the importance of identifying a relevant problem through review of the scientific literature, formulating an adequate research plan, and collecting data in the field. Lectures/discussions focus on proper experimental design, data analysis, and critiques of selected papers from the scientific literature. Prerequisites: 179H or consent of instructor; SCUBA certification, SCUBA equipment, and ocean diving experience.

6 units (Watanabe)

BIOPHYSICS PROGRAM

Chair: William Weis

Professors: Richard W. Aldrich (Molecular and Cellular Physiology), Steve Block (Applied Physics), Steven Boxer (Chemistry), Martin J. Brown (Radiation Oncology), Steven Chu (Applied Physics), Sebastian Doniach (Applied Physics), Philip C. Hanawalt (Biological Sciences), Keith O. Hodgson (Chemistry), Wray H. Huestis (Chemistry), Oleg Jardetzky (Molecular Pharmacology), Eric Kool (Chemistry), Ron Kopito (Biological Sciences), Roger D. Kornberg (Structural Biology), Michael Levitt (Structural Biology), Harden M. McConnell (Chemistry), David B. McKay (Structural Biology), W. E. Moerner (Chemistry), Norbert Pelc (Radiology), Ed Solomon (Chemistry), James A. Spudich (Biochemistry, Developmental Biology), Howard Schulman (Neurobiology)

Associate Professors: Gilbert Chu (Oncology), Amato Giaccia (Radiation Oncology), David Heeger (Psychology), Daniel Herschlag (Biochemistry), Jody Puglisi (Structural Biology), William Weis (Structural Biology), Tobias Meyer (Molecular Pharmacology)

Assistant Professors: Judith Frydman (Biological Sciences), Kenan C. Garcia (Microbiology and Immunology), Peter Jackson (Pathology), Peter Kuhn (SLAC), Vijay Pande (Chemistry), Julie Theriot (Biochemistry)

The Biophysics Program offers instruction and research opportunities leading to the Ph.D. in Biophysics. Students admitted to the program may perform their graduate research in any appropriate department.

GRADUATE PROGRAM

For information of the University’s basic requirements for the Ph.D. degree, see the “Graduate Degrees” section of this bulletin.

A small number of highly qualified applicants are admitted to the program each year. Applicants should present strong undergraduate backgrounds in the physical sciences and mathematics. The graduate course program, beyond the stated requirements, is worked out for each student individually with the help of appropriate advisers from the Committee on Biophysics. The requirements and recommendations for the Ph.D. degree include:
1. Training in physics or chemistry equivalent to that of an undergraduate physics or chemistry major at Stanford.
2. Completion of the following courses (or their equivalents):
   a) Biophysics 250
   b) Biochemistry 200, 201
   c) Chemistry 131, 171, 173, and 175
   d) Structural Biology 241 and 242
   e) Additional courses as required for the individually tailored program
3. Proficiency in one or more foreign languages and/or a computer language may be required at the discretion of the major professor.
4. Opportunities for teaching are available during the first nine quarters, at the discretion of the advising committee.
5. The student must prepare a Dissertation Proposal defining the research to be undertaken, including methods of procedure. This proposal should be submitted by Winter Quarter of the third year, and it must be approved by a committee of at least three members including the principal research adviser and at least one member from the Committee on Biophysics. The candidate must defend the dissertation proposal in an oral examination. The Dissertation Reading Committee normally evolves from the Dissertation Proposal Review Committee.
6. The student must present a Ph.D. dissertation as the result of independent investigation and expressing a contribution to knowledge in the field of biophysics.
7. The student must pass the University oral examination, taken only after the student has substantially completed the research. The examination is preceded by a public seminar in which the research is presented by the candidate.

COURSES

205. DNA Repair and Mutagenesis—(Enroll in Biological Sciences 205.)
   3 units, Spr (Hanawalt)
   210. Advanced Topics in Membrane Biochemistry—(Enroll in Biochemistry 210.)
   4 units (Pfeffer) not given 2000-01
   210A. Principles of Cell Physiology—(Enroll in Molecular and Cellular Physiology 210.)
   4 units, Spr (Aldrich, Lewis)
   211. Biophysics of Sensory Transduction—(Enroll in Biological Sciences 211.)
   4 units, Spr (Block)
   214. Physical and Chemical Principles of Biochemistry—(Enroll in Biochemistry 214.)
   4 units (Herschlag) not given 2000-01
   225. Molecular Motor Proteins and the Cytoskeleton—(Enroll in Biochemistry 225, Developmental Biology 225.)
   3 units (Fuller, Spudich) not given 2000-01
   228. Protein and Nucleic Acid Structure, Dynamics, and Engineering—(Enroll in Structural Biology 228.)
   3 units, Win (Levitt)
   237. Introduction to Biotechnology—(Enroll in Biochemistry 237, Biological Sciences 237, Chemical Engineering 450, Civil and Environmental Engineering 237, Developmental Biology 237, Structural Biology 237.)
   3 units, Spr (Robertson, Swartz)
   241. Biological Macromolecules—(Enroll in Structural Biology 241.)
   3 units, Aut (Aldrich, Ferrell, Herschlag, Lewis, Puglisi, Weis)

242. Methods in Molecular Biophysics—(Enroll in Structural Biology 242.)
   3 units, Win (Harbry, McKay, Puglisi, Weis)

250. Seminar in Biophysics—All graduate students in Biophysics must participate. Presentation of current research projects and results by all faculty in the Biophysics Program.
   1 unit, Aut, Win (Staff)

255. Responsible Conduct of Research—All graduate students must complete.
   Win

289. Biophysical Chemistry—(Enroll in Chemistry 289.)
   3 units (Staff) not given 2000-01

291. Biophysical Chemistry—(Enroll in Chemistry 291.)
   3 units (Staff) not given 2000-01

   3 units (Solomon) alternate years, given 2001-02

300. Research
   (Staff)
   Other biophysics courses in related departments:
   Chemistry 251, Neurobiology 216
   Other recommended courses:
   Biological Sciences 230; Biochemistry 200; Chemistry 271, 273, 275;
   Physics 170, 171, 230, 231, Structural Biology 211

CHEMISTRY*

Chair: Barry M. Trost
Associate Professors: Christopher E. D. Chidsey, Chaitan Khosla, Thomas J. Wandless
Assistant Professors: Hongjie Dai, Justin Du Bois, Vijay S. Pande, Daniel P. Stack
Consulting Associate Professor: David B. Smith
Lecturers: Stacey F. Bent, Karlene A. Cimprich
Visiting Associate Professor: Marcia B. France
Consulting Associate Professor: Wray H. Huestis

* The curriculum leading to the B.S. degree in Chemical Engineering is described in the "School of Engineering" section of this bulletin.

UNDERGRADUATE PROGRAMS

BACHELOR OF SCIENCE

Entrance Preparation—Students intending to major in chemistry are expected to have entrance credit in the preparatory subjects of chemistry, physics, and mathematics (including algebra and plane trigonometry). Those who do not have entrance credit or equivalent training in these subjects, particularly mathematics, may experience some difficulty in meeting the department requirements for graduation in four years, especially if they expect to pursue a program leading to professional certification by the American Chemical Society or to the B.S. degree with Honors.
Minimum Requirements—University Writing and General Education Requirements; Mathematics 41, 42, 51, 53; Physics 41, 43, 45, 46, 47, 48; Chemistry 31, 33, 35, 36, 131, 132, 133, 134, 151, 153, 171, 173, 174, 175, 176. In addition, Computer Science 106A and 106B are strongly recommended for students planning graduate study. Students interested in attending overseas campuses should consult their advisers as early as possible to avoid scheduling problems. Note that it is particularly convenient to attend an overseas campus during Spring Quarter of the second or third year, since the courses listed in this quarter may be delayed to subsequent years without disadvantage. No required course may be taken on a credit/no credit basis.

### TYPICAL SCHEDULE FOR A FOUR-YEAR PROGRAM

#### FIRST YEAR

<table>
<thead>
<tr>
<th>Course No. and Subject</th>
<th>Qtr. and Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chem. 31. Chemical Principles</td>
<td>A W S</td>
</tr>
<tr>
<td>Chem. 33. Structure and Reactivity</td>
<td>4</td>
</tr>
<tr>
<td>Chem. 35. Monofunctional Compounds</td>
<td>4</td>
</tr>
<tr>
<td>Chem. 36. Chemical Separations</td>
<td>3</td>
</tr>
<tr>

* Elective courses must be used to complete the University Writing, General Education, and Language Requirements. They may also be used to broaden one’s background in science and non-science areas and to provide an opportunity for advanced study in chemistry. Courses offered by other departments that may be of interest to chemistry majors include Biochem 200, 214; Biol. Sci. 31, 32, 33; Chem. Engr. 20, 120, 130; Civ. & Envir. Engr. 170; Comp. Sci. 100A-B; Econ. 1, English 191; Engr. 50; Geo. & Envr. Sci. 278; Math. 44, 106, 109B, 113, 131, 132; Mat. Sci. & Engr. 50; Physics 110, 111, 132; Stat. 60, 110, 116.

### AMERICAN CHEMICAL SOCIETY CERTIFICATION

Students who wish to be certified as having met the minimum requirements of the American Chemical Society for professional training must complete, in addition to the above requirements, at least 6 units from Chemistry 136 and/or 190; and at least 3 additional units from one of the following: Chemistry 136, any chemistry course numbered above 200 for which permission to register had been granted by the instructor, Biochemistry 200, or an advanced course in mathematics or physics. A reading knowledge of German or Russian is strongly recommended.

### HONORS PROGRAM

A limited number of undergraduates may be admitted to the Chemistry honors program at the beginning of the senior year. Those completing the program satisfactorily receive the B.S. degree in Chemistry with Honors.

Admission to the program requires a grade point average (GPA) of at least 3.0 in all course work in the University. In addition to the minimum requirements for the B.S. degree, the student must complete 9 units of Chemistry 190 to be taken 3 units per quarter for three quarters during the junior/senior years; and 9 additional units (including 3 units in chemistry) from Biochemistry 200, 241; Chemistry 221, 223, 225, 251, 253, 255, 271, 273, 275, 279; Mathematics 131, 132; Physics lecture courses numbered greater than 100; or other advanced courses approved by the department’s Undergraduate Study Committee. Students may not overlap ("double-count") courses for completing honors, major, minor, and cotermination requirements. An overall grade point average (GPA) of 3.3 in all chemistry, mathematics, and physics course work including 9 (most recent) units in Chemistry 190 is required for a degree with honors.

Students who wish to be admitted to the honors program should register in the department undergraduate office in Mudd 283 at the beginning of the senior year. Those who do not meet all of the above formal requirements may petition the department for admission.

### TEACHING CREDENTIALS

The requirements for certification to teach chemistry in the secondary schools of California may be ascertained by consulting the section on credentials under the “School of Education” section of this bulletin and the Credential Administrator of the School of Education.

### GRADUATE PROGRAMS

The University’s basic requirements for the M.S., M.A.T., and Ph.D. degrees are discussed in the “Graduate Degrees” section of this bulletin.

### GENERAL REQUIREMENTS

Qualifying Examinations—Each new graduate student must take qualifying examinations on entrance. These examinations consist of three written exams of two hours each in the fields of inorganic, organic, and physical chemistry, and cover such material as ordinarily is given in a rigorous one-year graduate course in each of these subjects. Students majoring in biophysical chemistry must pass examinations in biophysical and physical chemistry, and either organic or inorganic chemistry. Students who fail to pass these examinations in the Autumn Quarter are required to repeat them during the first week of the Winter Quarter. All qualifying examinations are given the week before instruction begins in Autumn Quarter, and must be taken at that time.

Satisfactory performance is required for permission to begin dissertation research and to continue work for an advanced degree. Students on full-time fellowships may complete all requirements for the Ph.D. degree in nine quarters. Students on research or teaching assistantships may complete their requirements in fifteen quarters.

Candidates for advanced degrees must have a minimum grade point average (GPA) of ‘B’ for all chemistry lecture courses as well as for all courses taken during graduate study. Required courses may not be taken with the credit/no credit option. All students are expected to give full time to graduate work once they have begun dissertation research. All prospective Ph.D. candidates, regardless of the source of financial support, are required to gain teaching experience as an integral part of graduate training. During the period in which a dissertation is being read by members of the faculty, candidates must be available for personal consultation until the dissertation has had final department approval.

### MASTER OF SCIENCE

Applicants for the M.S. degree in Chemistry are required to complete, in addition to the requirements for the bachelor’s degree, a minimum of 36 units of work and an M.S. thesis. Of the 36 units, approximately two-thirds must be in the department and must include at least 12 units of advanced course work in chemistry exclusive of the thesis. Of the 12 units, at least 3 units must be from Chemistry 221, 223, 225, 251, 253, 255, 271, 273, 275, or 297.
MASTER OF ARTS IN TEACHING (CHEMISTRY)

In cooperation with the School of Education, the department offers a program leading to the Master of Arts in Teaching (Chemistry). This degree is for candidates who have a teaching credential and wish to strengthen further their academic preparation. The program consists of a minimum of 25 units in the teaching field and 12 units in the School of Education. Detailed requirements are outlined under the “School of Education, Master of Arts in Teaching” section of this bulletin. Not offered 2000-01.

DOCTOR OF PHILOSOPHY

Graduate students are eligible to become formal candidates for the Ph.D. degree after passing the department qualifying examinations, satisfactorily completing most of the formal lecture course requirements, and beginning satisfactory progress on a dissertation research project. They then file for admission to candidacy for the Ph.D. degree. This filing must be done before June of the second year of graduate registration.

After passing the departmental qualifying examinations, students select research advisers by first interviewing at least ten members of the Chemistry faculty about their research. Students then file an Application to Start Research form with the Department of Chemistry Graduate Study Committee and begin research on their Ph.D. dissertation under the supervision of an adviser. All students in good standing are required to start research by the end of the Winter Quarter of the first year of graduate registration.

There is no foreign language requirement for the Ph.D. degree.

Candidates for the Ph.D. degree are required to participate continually in the department seminar (Chemistry 300), and in the division seminar of the major subject. In addition, continuous enrollment in Chemistry 301 is expected after the student has passed the qualifying examinations and chosen a research supervisor. As part of graduate training, Ph.D. candidates are required to gain experience as teaching assistants.

Before candidates may request scheduling of the University oral examination, clearance must be obtained from the major professor and the chair of the department’s Graduate Study Committee. Conditions that must be fulfilled before clearance is granted vary with the different divisions of the department and may be ascertained by consulting the chair of the committee.

It is the policy of the department to encourage and support in every possible way the pursuit of research and other advanced work by qualified students. Information about staff members with lists of their recent research publications is found in Chemistry at Stanford and the Directory of Graduate Research published by the American Chemical Society.

COURSE REQUIREMENTS

Students may major in inorganic, organic, physical, or biophysical chemistry. All graduate students are required to take six graduate-level courses (course numbers greater than 199) of at least 3 units each in chemistry or related disciplines (for example, biochemistry, electrical engineering, mathematics, pharmacology, physics, and so on), to be selected in consultation with their research adviser and the Graduate Study Committee. At least four of these courses should be taken in the first year. In addition, students majoring in Organic Chemistry must take 3 units in Chemistry 231 in the second year and 3 units in 233 in the second and third year. Required courses must be taken for a letter grade.

Students majoring in inorganic, physical or biophysical chemistry, or chemical physics and entering after 1998 must meet with their Reading Committee between the middle of their third year and the end of their fourth year to present past research and to propose and discuss ideas and research goals for the future. A written report of approximately two pages is given to the committee members prior to the mandatory meeting. The meeting consists of a 15-minute presentation plus discussion. The student and/or committee may ask for additional meetings prior to the thesis defense.

CHEMICAL PHYSICS

Students with an exceptionally strong background in physics and mathematics may, upon special arrangement, pursue a program of study in chemical physics.

Ph. D. MINOR

Candidates for the Ph.D. degree in other departments who wish to obtain a minor in chemistry must complete, with a GPA of 3.0 or higher, 20 graduate-level units in chemistry.

FELLOWSHIPS AND SCHOLARSHIPS

In addition to school fellowships and scholarships open to properly qualified students, there are several department fellowships in chemistry. Undergraduate scholarships are administered through the Financial Aid Office. Teaching assistantships and research assistantships are open to graduate students. Graduate fellowships, scholarships, and teaching assistantships are administered through the Department of Chemistry.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

Note—Lab fees, against which charges are made for breakage, are a minimum of $35 per quarter. Students taking courses with an * must preregister in the Department of Chemistry.

UNDERGRADUATE

22N. Stanford Introductory Seminar: The Frontiers of Science—Preference to freshmen. Expands the research focus of Chem. 32. Materials from readings on research breakthroughs, research seminars, and Ph.D. oral examinations campus-wide are integrated in discussions on the nature of modern research. Prerequisite: 32 or equivalent. GER:2a (DR:5)

3 units, Spr (Collman)

23N. Stanford Introductory Seminar: Chemistry and Biology—Preference to freshmen. An enrichment of introductory organic chemistry with biological applications. A clinically important molecule is selected to illustrate important contributions that biology has made to chemistry and vice versa. Topics: structure elucidation of complex molecules, chemical and biological synthesis of complex molecules, mechanism of action, and drug or agrochemical development. Corequisite: 33. GER:2a (DR:5)

3 units, Win (Khosla)

24N. Stanford Introductory Seminar: Nutrition and History—Preference to freshmen. Intended to broaden the introductory chemistry experience. The biochemical basis of historically important nutritional deficiencies (vitamins, minerals, starvation, metabolic variants that predispose to disease) and environmental toxins is related to physiological action and the sociological, political, and economic consequences of its effect on human populations. Prerequisite: high school chemistry. Recommended: 31, 32, or 33. GER:2a (DR:5)

3 units, Spr (Huestis)

2 units, Win (Djerassi)

27Q. Stanford Introductory Seminar: Lasers—The Light Fantastic—Preference to sophomores. Introduction to lasers and their impact on everyday life. The operation of lasers using concepts of atomic and molecular energy levels, optics, and resonance. The way blue light (CD players) is generated from a solid. The use of lasers to produce guide stars
for astronomy, sculpt the cornea, measure molecules in the ozone layer, transmit optical information, process semiconductors into high-density integrated circuits, and observe a single protein molecule in action. Prerequisites: 31 or Physics 23 and 25, or equivalents. GER:2a (DR:5)

3 units, Aut (Moerner)

28N. Stanford Introductory Seminar: Transforming Chemistry—Preference to freshmen. Chemistry is “the science that treats of the structure, composition, and properties of substances and of their transformations.” Among the four facets identified, “transformations” is the one that is most particularly the province of the chemist. Topics: transformations, or chemical reactivity in inorganic species, with emphasis on current hot issues. Prerequisite: 31 or 32 or equivalent. GER:2a (DR:5)

3 units, Win (Taube)

30. Introduction to Chemistry—Preparation for 31. For students with limited background in chemistry and mathematics. Introduction to chemical principles: moles, valence, stoichiometry, definitions, problem solving, quantitative skills.

3 units, Aut (Chidsey)

*31. Chemical Principles—For students with substantial chemistry background. Preparation for chemistry, chemical engineering, medicine, biochemistry, biology, and related fields. Atomic and molecular orbital theory, periodicity, bonding properties of matter, stoichiometry. Recitation. Prerequisites: high school chemistry and algebra. Recommended: high school physics. GER:2a (DR:5)

4 units, Aut (Boxer, Stack)
Win (Fayer, Andersen)
Sum (Staff)

*32. The Frontiers of Chemical Science—For students with AP Chemistry scores of 4 or 5 who wish to develop a deeper understanding. Complements a previous rigorous introduction to chemistry, encompassing structure and reactivity, and cutting across the traditional subdivisions of chemistry. Recent advances in structures, analytical methodologies, catalysis, redox phenomena, organometallic, and bio-inorganic chemistry. Lab and recitation. GER:2a (DR:5)

5 units, Aut (Collman, Zare)

*33. Structure and Reactivity—Organic chemistry, functional groups, hydrocarbons, stereochemistry, thermochemistry, kinetics, chemical equilibria. Recitation. Prerequisite: 31, 32, or an AP Chemistry score of 4 or 5. GER:2a (DR:5)

4 units, Win (Touster, Stack)
Spr (Wender)
Sum (Staff)

*35. Organic Monofunctional Compounds—Organic chemistry of oxygen and nitrogen aliphatic compounds. Recitation. Prerequisite: 33.

4 units, Aut (Huesis)
Spr (Du Bois, Flygare)
Sum (Staff)

*36. Chemical Separations—Techniques for separations of compounds; distillation, crystallization, extraction, and various chromatographic procedures. Lecture treats the theory; lab provides practice. Prerequisites: 33 and concurrent or previous enrollment in 35.

3 units, Spr (Touster)
Sum (Staff)

110. Directed Instruction/Reading—Undergraduates pursue a reading program under supervision of a faculty member in Chemistry; may also involve participation in lab. Prerequisites: superior work in 31 or 32, and approval of the instructor and of the Chemistry Undergraduate Study Committee.

1-2 units (Staff)

*130. Theory and Practice of Identification—For students in biomedical sciences; Chemistry majors take 132. Lectures on theory and interpretation of ultraviolet, infrared, nuclear magnetic resonance, and mass spectral data. Lab involves identification of unknowns and components of a mixture using derivatives and spectra. Lab. Prerequisites: 35, 36 (36 and 130 should be taken in consecutive years). Corequisite: 131.

4 units, Aut (Touster, Silcoff)

*131. Organic Polyfunctional Compounds—Aromatic compounds, polysaccharides, amino acids, proteins, natural products, dyes, purines, pyrimidines, nucleic acids, and polymers. Prerequisite: 35.

3 units, Aut, Win (France, Kool)

*132. Qualitative Organic Analysis—Required of and limited to chemistry majors; others may be admitted with consent of instructor. Separation of mixtures of organic compounds and identification of the components using rational synthesis and analysis of spectral data. Lab. Prerequisites: 35, 36, and concurrent registration in 131.

5 units, Aut (Touster, Staff)

3 units, Win (Smith, Goldstein)

*134. Theory and Practice of Quantitative Chemistry—Methods include gravimetric, volumetric, spectrophotometric, and electrometric. Lab. Prerequisite: 130 or 132. (WIM)

5 units, Win (Zare)

135. Physical Chemical Principles—Terminal physical chemistry for non-chemistry majors. Emphasis is on portions of physical chemistry most useful for students of the life sciences. Introduction to chemical thermodynamics, heterogeneous equilibria, thermodynamics of solutions, electrolytes, chemical kinetics, macromolecular solutions, and colloidal dispersions. Prerequisites: 31, calculus.

3 units, Win (Pecora)

*136. Synthesis Laboratory—Advanced synthetic methods in organic and inorganic laboratory chemistry. Prerequisites: 130 or 132, 131.

3 units, Spr (Touster)

151. Inorganic Chemistry I—Systematic introduction to the theories of electronic structure, stereochemistry, and symmetry properties of inorganic and organometallic molecules. Topics: ionic and covalent interactions, electron-deficient bonding, and elementary ligand field and molecular orbital theories. Emphasis is on the chemistry of the metallic elements. Prerequisites: 35. Recommended: 171.

3 units, Win (Collman)

153. Inorganic Chemistry II—Systematic presentation of the theoretical aspects of inorganic chemistry. Group theory; many electron atomic theory; molecular orbital theory, emphasizing general concepts and group theory; ligand field theory; application of physical methods to predict the geometry, magnetism, and electronic spectra of transition metal complexes; and theoretical aspects of electron transfer reactions. Prerequisites: 151, 173.

3 units, Spr (Solomon)

171. Physical Chemistry—Chemical thermodynamics; fundamental principles, Gibbsian equations, systematic deduction of equations, equilibrium conditions, phase rule, gases, solutions. Prerequisites: 35; Mathematics 51.

3 units, Aut (Pande)

173. Physical Chemistry—Introduction to quantum chemistry: the basic principles of wave mechanics, the harmonic oscillator, the rigid rotator, infrared and microwave spectroscopy, the hydrogen atom, atom-
ic structure, molecular structure, valence theory. Prerequisites: Mathematics 51, 53; Physics 41, 43, 45, 47.
3 units, Win (Boxer)

*174. Physical Chemistry Laboratory—Thermodynamics, transport, and spectroscopy. Experimental techniques include electronics, potentiometry, amperometry, calorimetry, and Fourier-transform infrared spectroscopy. Lab. Prerequisites: 134, 171, previous or concurrent enrollment in 173; Mathematics 53; and Physics 46, 48.
4 units, Win (Chidseyn)

3 units, Spr (Moerner)

*176. Physical Chemistry Laboratory—Use of chemical instrumentation to study fundamental areas of physical chemical time-dependent processes. Experiments include reaction kinetics, fluorimetry, and nuclear magnetic and electron spin resonance spectroscopy. Lab. Prerequisites: 173, 174, previous or concurrent enrollment in 175.
3 units, Spr (Dai)

GRADUATE

Undergraduates may register for chemistry courses numbered above 200 only if admitted to the honors program or by consent of the instructor.

3 units, Aut (Kool)

223. Advanced Organic Chemistry—Continuation of 221 with emphasis on physical methods. Prerequisite: 221 or consent of instructor.
3 units, Win (Du Bois)

225. Advanced Organic Chemistry—Continuation of 223. Organic reactions, new synthetic methods, conformational analysis, and exercises in the syntheses of complex molecules. Prerequisite: 223 or consent of instructor.
3 units, Spr (Wender)

227. Selected Topics in Organic Chemistry—May be repeated for credit. Possible topics: synthetic organic chemistry, photochemistry, inorganic-organic chemistry, bio-organic chemistry, reaction mechanisms, stereochemistry, structural chemistry of organic and biological molecules.
3 units (Staff)

229. Organic Chemistry Seminar—Attendance required of all graduate students majoring in organic chemistry. Students giving seminars register for 231.
1 unit, Aut, Win, Spr (Brauman)

231. Organic Chemistry Seminar Presentation—Required of all graduate students majoring in organic chemistry for the year in which they present their organic seminar. Second-year students must enroll all quarters.
1 unit, Aut, Win, Spr (Brauman)

232. Protein Science and Engineering—(Same as Chemical Engineering 452.) The physics-chemical interactions that govern structure and the function of proteins. Topics: protein function and structure, techniques for probing protein structure and function, mechanisms of protein function, design of proteins with novel properties. Examples from literature on enzymes. Recommended: background in physical and organic chemistry.
3 units, Win (Khosla)

233. Creativity in Organic Chemistry—Required of all second- and third-year Ph.D. candidates in organic chemistry. The art of formulating, writing, and orally defending a research progress report and two research proposals is practiced and criticized. Second-year students enroll Autumn and Spring, 3rd-year students enroll Winter.
1 unit, Aut, Win, Spr (Brauman)

235. Applications of NMR Spectroscopy—The uses of NMR spectroscopy in chemical and biochemical sciences, emphasizing data acquisition for liquid samples and including selection, setup, and processing of standard and advanced experiments.
3 units, Win (Staff)

251. Selected Topics in Advanced Inorganic Chemistry—May be repeated for credit. Prerequisites: one year of physical chemistry, consent of instructor.
3 units (Staff) not given 2000-01

253. Advanced Physical Inorganic Chemistry—Electronic structure and physical properties of transition metal complexes. Ligand field and molecular orbital theories, magnetism and magnetic susceptibility, electron paramagnetic resonance (including hyperfine interactions and zero field splitting) and electronic absorption spectroscopy (including vibrational interactions). Prerequisite: 153 or the equivalent.
3 units (Solomon) alternate years, given 2001-02

3 units, Aut (Waymouth)

257. Research Proposals in Inorganic Chemistry—May be required of second-year students in inorganic chemistry at the discretion of the research adviser. Research progress reports and research proposals are presented in oral and written form. Writing ability, oral defense, and scientific content is criticized.
1 unit, Aut, Win, Spr (Staff).

259. Inorganic Chemistry Seminar—Attendance required of all graduate students majoring in inorganic chemistry.
1 unit, Aut, Win, Spr (Staff)

271. Advanced Physical Chemistry—The principles of quantum mechanics. General formulation, mathematical methods, and elementary applications of quantum theory to the structure of atoms and molecules, including variational procedures, perturbation theory, operator and matrix methods, theory of angular momentum, and elements of the electronic structure of atoms. Prerequisite: 175.
3 units, Aut (Fayer)

273. Advanced Physical Chemistry—Topics in advanced quantum mechanics: vibrations and rotations of polyatomic molecules (normal modes, anharmonicity, wavefunctions and energy levels of rigid rotations, vibration-rotation interaction), ab initio electronic structure theory (Hartree-Fock, configuration interaction, multiconfiguration self-consistent-field, and many-body perturbation theory techniques), angular momentum theory (operators and wavefunctions, Clebsch-Gordan coefficients, rotation matrices), time-dependent quantum mechanics (time evolution operator, Feynman path integrals, scattering theory, Born approximation, Lipmann-Schwinger equation, correlation functions).
interaction of radiation and matter (semiclassical and quantum theories of radiation, transition probabilities, selection rules). Prerequisite: 271 or Physics 230.

3 units, Win (Dai)

275. Advanced Physical Chemistry—The basic principles and methods of statistical mechanics from the ensemble point of view, statistical thermodynamics, heat capacities of solids and polyatomic gases, chemical equilibria, equations of state of fluids, phase transitions. Prerequisite: 271.

3 units, Spr (Pande)

276. Advanced Physical Chemistry—Time-dependent statistical mechanics: ensemble theory for equilibrium and nonequilibrium systems; static and dynamic correlation functions for fluctuating equilibrium systems; the relationship of correlation functions, spectroscopy, and transport; dynamical models used in chemistry, including classical mechanics, quantum mechanics, Brownian dynamics, Smoluchowski dynamics, and Markov processes. Applications to topics of interest in physical chemistry. Prerequisite: 275.

3 units, Aut (Andersen)

277. Selected Topics in Physical Chemistry—Possible topics: structure elucidation using diffraction techniques, advanced statistical mechanics, crystal field theory, advanced quantum mechanics, magnetic relaxation, advanced thermodynamics, chemical applications of group theory. May be repeated for credit. Prerequisite: 275 or consent of instructor.

3 units (Staff)

279. Physical Chemistry Seminar—Required of all graduate students majoring in physical chemistry.

1 unit, Aut, Win, Spr (Staff)

283. Research Proposals in Physical Chemistry—May be required of 2nd- and 3rd-year graduate students at the discretion of the research adviser. Students present research proposals and progress reports on their research in physical chemistry, using oral and written forms. Topics may be drawn from the student’s research of a related area in physical chemistry. Written form, oral presentation, and scientific merit are evaluated.

1 unit, Aut, Win, Spr (Staff)

287. Biophysical Chemistry—The theoretical and experimental aspects of biophysical phenomena, emphasizing membrane biophysics and membrane biology. Pre- or corequisites: 171 and 173, or the equivalent.

3 units (Staff) not given 2000-01

289. Biophysical Chemistry—Experimental methods in biophysics. Emphasis is on spectroscopic techniques including magnetic resonance and optical methods. Prerequisite: 287.

3 units (Staff) not given 2000-01

291. Biophysical Chemistry—Special topics in biophysical chemistry. Pre- or corequisites: 171 and 173, or the equivalent.

3 units (Staff) not given 2000-01

293. Structural Inorganic Chemistry—Structural biophysical chemistry, x-ray crystallography, and related techniques as used in biophysical research. Electron and optical microscopy and neutron diffraction. Prerequisite: 291 or consent of instructor.

3 units (Staff) not given 2000-01

297. Bio-Inorganic Chemistry—Overview of metal sites in biology. Metalloproteins as elaborated inorganic complexes, their basic coordination chemistry and bonding, unique features of the protein ligand, and the physical methods used to study active sites. Active site structures are correlated with function. Prerequisites: 153 and 173, or equivalents.

3 units (Solomon) alternate years, not given 2001-02

299. Teaching of Chemistry—Required of all teaching assistants in chemistry. Techniques of teaching chemistry by means of lectures and labs.

1-3 units, Aut, Win, Spr (Staff)

300. Department Colloquium—Required of all graduate students.

1 unit, Aut, Win, Spr (Staff)

301. Research in Chemistry—Required of all graduate students who have passed the qualifying examination. Open to qualified graduate students with the consent of the major professor. Research seminars and directed reading deal with newly developing areas in chemistry and experimental techniques. May be repeated for credit. Students register giving section number of staff member and number of units agreed upon.

2 units, Aut, Win Spr (Staff)

459. Frontiers in Interdisciplinary Biosciences—(Cross-listed in multiple departments in the schools of Humanities and Sciences, Engineering, and Medicine; students should enroll directly through their affiliated department, if at all possible.) Introduction to cutting-edge research involving interdisciplinary approaches to bioscience and biotechnology; for specialists and non-specialists. Associated with Stanford’s Clark Center for interdisciplinary Bioscience, and held in conjunction with a seminar series meeting twice monthly during 2000-01. Leading investigators from Stanford and throughout the world speak on their research; students also meet separately to present and discuss the ever-changing subject matter, related literature, and future directions. Prerequisite: keen interest in all of science, with particular interest in life itself. Recommended: basic knowledge of biology, chemistry, and physics.

2 units, Aut, Win, Spr (S. Block)

RESEARCH AND SPECIAL ADVANCED WORK

190. Introduction to Methods of Investigation—Limited to undergraduate students admitted under the honors program or by special arrangement with a member of the teaching staff. For general character and scope, see 200. Prerequisite: 132. Corequisite: 300.

(Staff)

200. Research and Special Advanced Work—Properly qualified graduate students are encouraged to undertake research, or advanced lab work not covered by listed courses, under the direction of a member of the teaching staff. For research and special work, students register for 200 (190, if undergraduate), giving section number of staff member under whom work is carried on and number of units agreed upon.

(Staff)

CLASSICS

Emeriti: (Professors) Mark W. Edwards, Michael H. Jameson, Edward Spofford, Michael Wigodsky

Chair: Susan A. Stephens

Graduate Director: Richard Martin

Undergraduate Director: Reviel Netz

Professors: Alessandro Barchiesi, Andrew M. Devine, Richard P. Martin, Marsh H. McCall, Jr., Ian Morris (Classics, History), Michael Shanks, Susan A. Stephens, Susan Treggiari (Classics and, by courtesy, History)

Associate Professors: Jody Maxmin (Art and Art History, Classics), Andrea W. Nightingale (Classics, Comparative Literature), M. Rush Rehm (Classics, Drama)

Assistant Professors: Joy Connolly, Joseph G. Manning, Reviel Netz, Yasmin Syed

Courtesy Professors: George Brown, Robert C. Gregg, Ian Hodder
UNDERGRADUATE PROGRAMS

The Department of Classics offers courses on all aspects of Greek and Roman culture: art and archaeology, cultural studies, history, language, literature, and philosophy. The department offers five majors in Classics (Ancient History, Classical Studies, Greek, Greek and Latin, and Latin) which vary in the number of language courses they require; each of these majors can be completed in conjunction with a second major in the sciences or in other humanities departments.

The major in Classics affords an opportunity to develop a competence in the classical languages; an appreciation, comprehension, and enjoyment of classical literature; and an understanding of the history and culture of the ancient world, and its connections with the present. The department encourages students who wish to do their major work in Classics and also students who wish to relate work in Classics to work in other departments.

BACHELOR OF ARTS

Prospective majors in Classical Studies, Greek, and Latin (options 1, 2, and 3) are encouraged to declare at the beginning of the junior year but are urged to discuss their plans with the Undergraduate Director as early as possible. Students who choose to major in Greek and Latin (option 4) should begin the curriculum as soon as possible, since it is difficult to complete the language requirements without an early start. Those with no previous knowledge of Latin or Greek should begin study in the freshman year or as early as possible in the sophomore year.

To declare the major, a student must fill out the Declaration of Major form in the Registrar’s Office and meet with the Undergraduate Director in the Department of Classics. At that time, the Undergraduate Director assigns each student a department adviser who helps to prepare a program of study; students should meet with their advisers at least once a quarter. Each student’s progress towards fulfillment of the major requirements is recorded in a file kept in the main office. It is the student’s responsibility to work with his or her adviser in keeping this file up to date.

The A.B. degree may be earned by fulfilling the requirements for one of the five following majors:

1. **Classical Studies:** at least 60 units, including at least two courses in Latin or Greek at the 100 level or higher, or one course in one of the languages at the 100 level or higher plus the series 1, 2, 3, or 51 and 52 in the other language (or an equivalent approved by the department). In addition, students are required to take the Majors Seminar (378-176) and at least one course in each of the following five groups: ancient history, art and archaeology, literature in translation, philosophy, religion and mythology. Students are strongly urged to meet with the Undergraduate Director to discuss options for pursuing a period of study in the Mediterranean region.

   This major is recommended for students who wish to study the classical civilizations in depth but do not wish to study the languages to the extent required by options 2, 3, and 4. It is not suitable for students who wish to do graduate work in Classics or to teach Latin or Greek in high school, as the language work is insufficient for these purposes.

2. **Greek:** at least 60 units, including a minimum of 31 units in Greek courses at the 100 level or higher (it is recommended that no one of these courses be Greek 175A, although this course should not be taken until students have completed three years of Greek). In addition to courses in Greek, students are required to take the Majors Seminar (378-176) and at least one course in each of the following three groups: ancient history and civilization, historical and social theory. The courses chosen must be approved in advance by the Undergraduate Director. With the approval of the instructor and the Undergraduate Director, students may substitute graduate seminars in ancient history for some of these courses.

   Breadth Requirement: each student must take at least 4 units in each of the following areas—archaeology and art, comparative ancient civilizations, historical and social theory. The courses chosen must be approved in advance by the Undergraduate Director, and will normally be chosen from the list of recommended courses below:

   1. Archaeology and Art: for example, any course with the 372 prefix; Cultural and Social Anthropology 1/101, 90, 211; Archaeology 33; Art and Art History 100A, B, or C, 120A, 200, 200C.
   2. Comparative Ancient Civilizations: for example, Anthropological Sciences 3, 7, 103, 106, 107, 108, 141, 150; History 192A.
   3. Historical and Social Theory: for example, Cultural and Social Anthropology 1/101, 90; History 173C, 202, 206; Sociology 1, 110, 113, 140, 142, 170.

   Students are strongly urged to meet with the Undergraduate Director to discuss options for pursuing a period of study in the Mediterranean region.

3. **Latin:** at least 60 units, including a minimum of 31 units in Latin courses at the 100 level or higher (it is recommended that one of these courses be Latin 175A, although this course should not be taken until students have completed three years of Latin). In addition to courses in Latin, students are required to take the Majors Seminar (378-176) and at least one course in each of the following three groups: history/archaeology, literature in translation, and philosophy/religion. The introductory sequence (1, 2, 3, or 51 and 52) or one 100-level course in Greek is recommended. Beginning courses in Latin, if required, may be counted towards the total of 60 units. Relevant courses in other departments of the humanities may count towards the major with the consent of the Undergraduate Director. Students are strongly urged to meet with the Undergraduate Director to discuss options for pursuing a period of study in the Mediterranean region.

4. **Greek and Latin:** at least 60 units, including 30 units in Greek courses and the same number in Latin. It is recommended that students take Greek 175A or Latin 175A (or both), although these courses should not be taken until students have completed three years of the respective language. All students are required to take the Majors Seminar (378-176); it is strongly recommended that students take a course in ancient history. Relevant courses in other departments of the humanities may count towards the major with the consent of the Undergraduate Director. Students are strongly urged to meet with the Undergraduate Director to discuss options for pursuing a period of study in the Mediterranean region.

5. **Ancient History Major:** at least 60 units of approved courses. All courses counted for the degree must be taken for a letter grade. Students must satisfy four requirements:

   a. Writing in the Major (WIM) Requirement: this is fulfilled by taking the Majors Seminar (5 units), Interpreting Antiquity (378-176).
   b. Depth Requirement: a major must take at least 40 units of ancient history and civilization courses, drawn from courses with 371 and 378 prefixes. The courses chosen must be approved in advance by the Undergraduate Director. With the approval of the instructor and the Undergraduate Director, students may substitute graduate seminars in ancient history for some of these courses.
   c. Breadth Requirement: each student must take at least 4 units in each of the following areas—archaeology and art, comparative ancient civilizations, historical and social theory. The courses chosen must be approved in advance by the Undergraduate Director, and will normally be chosen from the list of recommended courses below:

   1. Archaeology and Art: for example, any course with the 372 prefix; Cultural and Social Anthropology 1/101, 90, 211; Archaeology 33; Art and Art History 100A, B, or C, 120A, 200, 200C.
   2. Comparative Ancient Civilizations: for example, Anthropological Sciences 3, 7, 103, 106, 107, 108, 141, 150; History 192A.
   3. Historical and Social Theory: for example, Cultural and Social Anthropology 1/101, 90; History 173C, 202, 206; Sociology 1, 110, 113, 140, 142, 170.

   Students are strongly urged to meet with the Undergraduate Director to discuss options for pursuing a period of study in the Mediterranean region.

**MINORS**

The Undergraduate Director meets with each student who opts for a minor to discuss his/her chosen curriculum and assigns the student an adviser in the relevant field. Students are required to work closely with their advisers to create a cohesive curriculum within each area. Students
may organize their curriculum according to different principles: for example, they may wish to focus on a specific historical period (Classical Athens, Imperial Rome), or on a specific theme or topic (women in antiquity). After consulting with the adviser, each student must submit (in writing) a "Proposed Curriculum" to the Undergraduate Director. Students may proceed with the minor when the Undergraduate Director has approved the proposal. Courses offered in Greek and Latin above the 100 level may count toward the minor, provided the subject matter is suitable.

All students minoring in Classics are required to take the Majors Seminar (378-176), Interpreting Antiquity, which is writing intensive. Students may choose between three minors in Classics:

1. **Classical Languages**:
   - Students are required to take a minimum of five courses in Greek or in Latin plus the Majors Seminar (378-176). Students wishing to combine Greek and Latin may only do so if courses for one of the two languages are all above the 100 level; for example, Greek 51, 52, plus Latin 103, 111, 175.

2. **History**:
   - Students are required to take a minimum of five courses in history, art history, and archaeology plus the Majors Seminar (378-176). Courses offered in Latin and Greek that focus on historical topics or authors may count toward the minor.

3. **Literature and Philosophy**:
   - Students are required to take a minimum of five courses in classical literature or philosophy plus the Majors Seminar (378-176). Courses offered in Latin and Greek that focus on philosophical or literary topics or authors may count toward the minor.

**HONORS PROGRAMS**

A minimum grade point average (GPA) of ‘B+’ in Classics courses is required for students to enroll in the honors program. To be considered for honors, students must select a professor who can supervise his or her honors thesis. Together with the supervisor, the student writes a two- to three-page proposal at the beginning of the senior year. The proposal should outline the project in detail, list relevant courses that have been taken, and name the supervisor. The department gives approval only if it is satisfied that the student has a sufficient basis of knowledge derived from department course work in the general areas of the thesis course (that is, course work in art, Greek, and/or Latin language, history, literature, philosophy, and so on). If the proposal is approved, the student may sign up for Undergraduate Thesis (378-199) during one or two quarters of the senior year for a maximum of 6 units a term, up to an overall total of 10 units. Honors are awarded only if the essay receives a grade of ‘B+’ or higher from the supervisor and a second reader.

**HUMANITIES**

For majors in Classics with appropriate interests, the honors program in Humanities is available, a description of which is found under the “Interdisciplinary Studies in Humanities” section of this bulletin.

**OVERSEAS STUDIES**

Funding: Students whose record in Classics indicates that they are fully qualified for a given program may apply for funding from the Department of Classics. Students must submit a proposal to the Undergraduate Director, which should include an itemized list of expenses based on the fees charged by the program (that is, room, board, tuition, and other expenses). Limited funding is available each year; preference is shown to students with strong records.

Programs:

1. **Rome**: Classics majors are encouraged to apply for the Intercollegiate Center for Classical Studies (ICCS) in Rome which is managed by Duke University for about 50 constituent colleges and universities. It is open to Stanford majors in Classics, History, and Art History. All courses receive full credit at Stanford and may be applied to the respective major. Students interested in this program should consult the Undergraduate Director and the ICCS representative in the Department of Classics as early as possible in their career at Stanford to plan their course preparation and application. Competition is strong and applicants are expected to have taken one or more courses in Roman history and at least two years of Latin before they arrive in Rome. Brochures are available at the department office.

Other programs offer a quarter, semester, or summer session in Rome. Interested students are urged to visit Bechtel International Center.

2. **Greece**: Students are encouraged to apply for the summer session at the American School of Classical Studies in Athens. The school is recommended principally for Classics majors with at least two years of ancient Greek. A student wishing to apply should prepare by taking courses in Greek history, archaeology, and art; beginning Modern Greek is strongly recommended. Applicants should see the Undergraduate Director early in the academic year. Other programs offer a quarter, semester, or summer session in Greece. Interested students are urged to visit Bechtel International Center.

**GRADUATE PROGRAMS**

**MASTER OF ARTS**

University requirements for the master’s degree are described in the “Graduate Degrees” section of this bulletin. Students who have completed an undergraduate major in Classics (Greek and/or Latin) or its equivalent may be accepted as candidates for the A.M. degree in Classics or A.M. in Classics in the field of Greek or Latin, and may expect to complete the program in twelve months (usually three quarters of course work plus three months study for the thesis or examination). Students without an undergraduate major in Classics may also be accepted as candidates, though they may require a longer period of study before completing the requirements for the degree. These requirements are:

1. Attaining a standard of scholarship such as would be reached by three quarters of study in the department after fulfilling the requirements for an undergraduate major in the department. Normally, this means completing at least 18 units of graduate courses and 18 units of work at the 140 level or above.

2. Satisfactory completion of one Greek course at the 100 level (if the undergraduate major has been Latin) or one Latin course at the 100 level (if the undergraduate major has been Greek).

3. Passing an examination testing the candidate’s ability to translate into English from a selected list of Greek and/or Latin authors.

4. Satisfactory completion of the 275A,B sequence in at least one language (Latin or Greek).

5. Writing a thesis, or passing an examination on a particular author or topic, or having written work accepted by the graduate committee as equivalent. Three completed and satisfactory seminar papers are normally an acceptable equivalent.

6. Reading knowledge of French or German.

7. Completion of a Program Proposal for a Master’s Degree form in the first quarter of enrollment.

Candidates for the Ph.D. degree may also (on the recommendation of the department) become candidates for the A.M. degree. In their case, requirement "5" above is waived provided that they have completed some work beyond the course requirements listed under requirements '1' and '2' above.

**DOCTOR OF PHILOSOPHY**

University requirements for the Ph.D. are described in the “Graduate Degrees” section of this bulletin. All candidates for the Ph.D. degree in Classics must fulfill the following requirements:

1. Complete at least three years (nine quarters) of full-time work, or equivalent, in study beyond the bachelor’s degree. This must include the 207-208 sequence (unless the student is exempted by examination) and the 275A,B sequence, and normally at least twelve graduate seminars acceptable to the department, in addition to the doctoral dissertation. At least three consecutive quarters of graduate work and the final units of credit in the program must be taken at Stanford. More detailed information on the Ph.D. program is available from a brochure in the Department of Classics office.
2. Candidates are required to pass examinations as follows:
   a) Reading examinations in French and German. In some circumstances Italian may be substituted for French. Students should plan to satisfy this requirement as soon as possible, normally no later than the end of the second year.
   b) Translation examinations into English from prepared sets of Greek and Latin authors. These examinations must be taken at the end of the first year and at the end of the second year as part of the requirement for the 207-208 sequence.
   c) General examinations in four of the following fields: Greek literature, Latin literature, ancient philosophy, Greek history, and Roman history. At least one field must be historical and another must be literary, and at least one field must be Greek and another must be Latin or Roman. Students select the fields in consultation with the Graduate Director no later than June of the second year of graduate study. Three of the fields are tested by written examination combined with a supplemental general oral examination. General examinations must be taken in October of the third year.
   d) The University oral examination on the candidate's dissertation. The examinations, in translation from Greek and Latin authors, must be taken at the end of the first and at the end of the second year of graduate work, the general written and oral examinations in October of the third year, and the University oral examination at the end of the dissertation. In preparing for the general examinations, candidates are expected to make full use of relevant secondary material in modern languages. They should therefore plan to satisfy the requirements in French and German as soon as possible, preferably before the translation examinations. Except in very special circumstances, candidates may not take the general examinations until the modern language requirements have been completed.

3. Each candidate, after passing the general examination, selects a dissertation director who must be a member of the Academic Council. In consultation with the dissertation director, the candidate prepares a statement of the dissertation topic to be submitted for approval by the Graduate Committee. When the statement of the dissertation topic has been approved, the candidate, the dissertation director, and the Graduate Committee collaborate to select an appropriate dissertation committee. Two of the three members of the reading committee, including the chair, must be members of the Academic Council.

4. All students are required to undertake the equivalent of four one-quarter courses of teaching under department supervision. This teaching requirement is normally completed during the second and third years of study.

Ph.D. MINOR

For a graduate minor, the department recommends at least 20 units in Latin or Greek at the 100 level or above, and at least one course at the graduate (200) level.

CLASSICS AND A MINOR FIELD

The Ph.D. in Classics may be combined with a minor in another field, such as anthropology, history, humanities (see below), classical linguistics (see below), or philosophy. Requirements for the minor field vary, but might be expected to involve about six graduate-level courses in the field and one written examination, plus a portion of the University oral exam. Such a program is expected to take five years. The department encourages such programs for especially able and well prepared students and is normally able to offer one fellowship each year to support a student in the fifth year of a combined program. The following timetable would be typical for a five-year program:

   First Year: course work, almost entirely in Classics. One translation exam taken in June. One or both modern language exams taken.
   Second Year: course work, both in Classics and the minor field. Second translation exam completed. French and German exams completed.
   Third Year: course work, both in Classics and the minor field. General examinations in Classics.

Fourth Year: remaining course work, both in Classics and the minor field.

General examination in the minor field. Preparation for dissertation.

Fifth Year: dissertation, University oral examination.

GRADUATE PROGRAM IN HUMANITIES

The Department of Classics participates in the Graduate Program in Humanities leading to the joint Ph.D. degree in Classics and Humanities. For a description of that program see the "Interdisciplinary Studies in Humanities" section of this bulletin.

COMPARATIVE LITERATURE

The Department of Classics cooperates closely with the graduate program in the Department of Comparative Literature. Interested students should consult the chair of the department.

COURSES

(WIM) indicates that the course meets the Writing in the Major requirements.

GREEK

UNDERGRADUATE

Students whose major work is in another department and who wish to fulfill a departmental foreign language requirement by taking Greek should consult their department advisers to determine the precise nature of that department's requirements.

Courses in Greek all have department prefix 373.

1. First-Year Greek—For beginners.
   5 units, Aut (Teiman)

2. First-Year Greek—Continuation of 1.
   5 units, Win (Tieman)

3. First-Year Greek—Continuation of 2.
   5 units, Spr (Tieman)

10. Intensive First-Year Greek—Intensive beginning Greek equivalent to 1, 2, 3. The goal is the reading of easy classical or New Testament Greek by the end of the quarter. Short readings in philosophical Greek.
   8-9 units, Sun (Staff)

51. First-Year Greek—Accelerated.
   10 units, given 2001-02

52. First-Year Greek—Accelerated. Continuation of 51.
   10 units, given 2001-02

INTERMEDIATE/ADVANCED

Students are admitted to these courses by completing Greek 3, 10, or 51-52, or on the basis of previous work done in secondary school or elsewhere. Usually two to three years of secondary school Greek qualifies a student for 101, three to four years for 111. Students with previous knowledge of Greek should consult the Undergraduate Director in Classics to determine the course for which they are best suited.

Students whose major work is in another department and who wish to fulfill a departmental foreign language requirement by taking Greek should consult their department advisers to determine the precise nature of that department's requirements. Most departments are satisfied if part of the series 101, 102, 103 is completed.

101. Second-Year Greek—Selections from Plato, Xenophon, Lucian.
   5 units, Aut (Rogers)

102. Second-Year Greek—Greek Tragedy, one play.
   5 units, Win (Martin)

183. Second-Year Greek—Homer, selected books from the Odyssey.
   5 units, Spr (Alonge)
104. New Testament Greek
2-3 units, given 2001-02

111. Third-Year Greek—Poetry.
3-5 units, Aut (Alonge)

112. Third-Year Greek—Scientific writing.
3-5 units, Win (Netz)

113. Third-Year Greek—Plato.
3-5 units, Spr (Romano)

175/275A,B. Greek Syntax—(First-year graduate students register for 275.) The nuances of Greek syntax and style, the stylistic analysis of selected prose authors, techniques of sight-translation, and the writing of idiomatic Greek prose. Begins the 5th week of the Winter Quarter and continues through the end of the Spring Quarter. Prerequisite for undergraduates: three years of Greek.

2 units, Win (Syed) (Sweeks)
4 units, Spr (Stephens)

370. Advanced Greek Prose or Verse Composition
2-3 units, given 2001-02

LATIN

UNDERGRADUATE

Students whose major work is in another department and who wish to fulfill a departmental foreign language requirement by taking Latin should consult their department’s advisers to determine the precise nature of those requirements. Most departments are satisfied if part of the series 101, 102, 103 is completed.

Courses in Latin have department prefix 375.

1. First-Year Latin—For beginners.
5 units, Aut (Serfass)

2. First-Year Latin—Continuation of 1.
5 units, Win (Serfass)

3. First-Year Latin—Continuation of 2.
5 units, Spr (Serfass)

10. Intensive First-Year Latin—Intensive beginning Latin equivalent to 1, 2, 3, or 51 and 52. The goal is the reading of easy Latin prose and poetry by the end of the quarter.
8-9 units, Sum (Staff)

51. First-Year Latin—Accelerated.
10 units, given 2001-02

52. First-Year Latin—Accelerated; continuation of 51.
10 units, given 2001-02

INTERMEDIATE/ADVANCED

Students are admitted to these courses by completing Latin 3, 10, 51, and 52, or on the basis of previous work done in secondary school or elsewhere. Usually two to three years of secondary school Latin qualifies a student for 101, three to four years for 111. Students with previous knowledge of Latin should consult the Undergraduate Director in Classics to determine the course for which they are best suited. Students whose major work is in another department and who wish to fulfill a departmental foreign language requirement by taking Latin should consult their department’s advisers to determine the precise nature of those requirements. Most departments are satisfied if part of the series 101, 102, 103 is completed.

5 units, Aut (Kleps)

5 units, Win (Connolly)

103. Second-Year Latin—Selections from Vergil, Aeneid, selected books.
5 units, Spr (Lavigne)

111. Third-Year Latin—Poetry, lyric.
3-5 units, Aut (Kelly)

112. Third-Year Latin—Poetry.
3-5 units, Win (Lavigne)

3-5 units, Spr (Rogers)

175/275A,B. Latin Syntax—(First-year graduate students register for 275.) Intensive review of Latin syntax. Begins in Autumn Quarter and ends the 5th week of the Winter Quarter. Prerequisite for undergraduates: minimum of three years of Latin.

4 units, Aut (Devine)
2 units, Win (Devine) (five weeks)

370. Advanced Latin Prose or Verse Composition
2-3 units, any quarter (Staff)

GRADUATE

These courses have department prefix 378.

205A,B. The Semantics of Grammar—Supplements Latin and Greek 275, providing an introduction to the grammatical encoding of semantic and informational meaning. Topics: case, gender, tense, and aspect. A theoretical background for teachers of Greek and for the analysis of literary and non-literary texts.

2 units, Aut (Devine)
1 unit, Win (Devine)

207A,B,C, 208A,B,C. Survey of Greek and Latin Literature—Required two-year sequence focusing on the origins, development, and interaction of Greek and Latin literature, history, and philosophy. Greek and Latin material are taught in alternate years.

207A. Republican Latin
4-5 units, Aut (Syed)

207B. Augustan Age
4-5 units, Win (Barchesi)

207C. Imperial Latin
4-5 units, Spr (Connolly)

208A. Archaic Greek
4-5 units, given 2001-02

208B. Classical Greek
4-5 units, given 2001-02

208C. Hellenistic and Latin Greek
4-5 units, given 2001-02

Some of the above courses may be continued the following quarter by arrangement with the instructor. This usually requires the writing of an extended research paper based on work directly related to the course.

COURSES IN TRANSLATION

UNDERGRADUATE

These courses have department prefix 378.

1. An Introduction to Ancient Egyptian Hieroglyphics—The ancient Egyptian writing system had more than 3,000 years of continuous development covering stories, letters, and documents concerning the history of women, law, economics, and medicine. Introduces the language and its scripts to be able to read basic texts and inscriptions. Focus
is on the legacy of the ancient Egyptian language and Egyptian texts to the classical world and beyond.

3-4 units, given 2001-02

2. Introduction to Coptic—The Coptic language is the final stage of ancient Egyptian. It is a key language for the study of early Christianity and the survival pagan culture in Egypt, and the key to the decipherment of the Rosetta Stone and Egyptian hieroglyphic writing. Emphasis is on basic grammar and, as time permits, some important literatures preserved in Coptic (the New Testament and the "Saying of the desert fathers").

3-4 units, given 2001-02

8. Ancient Policies: Practices of Citizenship in Greece and Rome—It is common, especially in the U.S., to hear complaints about the decline of civic identity and the demise of the responsible citizen. What do these phases mean? How do we define the ideal citizen? The theoretical and practical debates over the virtues, responsibilities, and risks of citizenship in a range of ancient texts: ancient drama, political speeches, Plato’s Republic, Aristotle’s Politics, Cicero’s treaties on government, Plutarch’s biographies, and a section of readings on ancient education. Readings in English.

3-4 units, Win (Connolly)

12. Greek Tragedy—The tragedies produced in 5th-century Athens represent a moment in the history of human creativity. Twelve plays by Aeschylus, Sophocles, and Euripides are studied with Aristotle’s Poetics and Aristophanes’ Frogs. Emphasis is on the range and depth of Greek tragedy, the power and complexity of the poetry, the connections to 5th-century social and political issues, and the performance conditions and conventions of the ancient theater. GER:3b (DR:9)

3-5 units, Spr (McCall)

18. Greek Mythology—The heroic and divine in the literature, mythology, and culture of archaic Greece. Interdisciplinary approach to the study of individuals and society. Illustrated lectures. Selected readings, in translation, of Homer, Hesiod, Herodotus, and the poets of lyric and tragedy. GER:3a (DR:8)

3-4 units, Spr (Syed)

22N. Stanford Introductory Seminar: Technologies of Civilizations, Writing, Number, Money—Preference to freshmen. For 5,000 years, civilization has been growing at an exponential rate. The keys to this growth were the technologies of civilization, writing, number, and money, enabling the creation of complex societies and enhancing human cognition itself. Focus is on the role of cognition in shaping history and the role of history in shaping cognition. The perspective is global, emphasizing Western tradition and its ancient Greek roots. GER:3b (DR:9)

3-4 units, Aut (Netz)

23N. Stanford Introductory Seminar: Cross Cultural Perspectives of Love—Preference to freshmen. Love and its accompanying gender dynamics are examined from a variety of perspectives and in different historical and cultural contexts. Texts: ancient Roman poetry, Ovid’s poem the Art of Love, Choderlos de Laclos’ novel Dangerous Liaisons, Plato’s Symposium, Freud’s theory of love, Jessica Benjamin’s The Bonds of Love, and Foucault’s History of Sexuality. The relative merits of theoretical vs. literary accounts of love, the concept of romantic love and women’s desire, the cultural roots of romantic love in contemporary society, its cultural boundaries and its underlying gender organization. GER:3a,4c (DR:8f)

3-4 units, Aut (Syled)

30Q. Stanford Introductory Seminar: Literature and Culture of Modern Greece—Preference to sophomores. Focus is on modern Greece since its establishment as a nation. Literary works of prominent authors, films, and documents highlight issues related to Greek institutions, social structures, traditions, and culture. Emphasis is on topics of ethnicity, Greek heritage and national identity, kinship and gender issues, and migration patterns.

3-5 units, Aut (Prionas)

116/216. Eros, Mathematics, and Reality: Reading of Plato—Two routes led Plato into higher reality: Eros (Symposium, Phaedrus) and mathematics (Republic, Timeaus). By following the two routes we understand what Plato’s higher reality was like. GER:3b (DR:9)

3-4 units, Win (Netz, Moravscik)

117. Gender, Violence, and the Body in Ancient Religion—How did the Ancient Greeks organize their communal response to family conflict, political compensation, war, marriage and death? What was it like to live in a city where all those responses were organized along gender lines? Tragedies and comedies from ancient Athens, and the writings of some ancient philosophers, poets, and modern thinkers are explored to understand how a sophisticated pre-technological people used religious ritual to maneuver within a strictly segregated sex-gender system that simultaneously exacerbated the psychic tensions of social life, and afforded them some measure of healing. GER:4c (DR:†)

3-4 units, Aut (Gleason)

119. Gender and Power in Ancient Rome—GER:3a,4c (DR:8f)

3-4 units, Win (Stephens)

130. Singers of Tales: Ancient and Contemporary Epic in Action—Epics from four contemporary non-Western cultural areas help to understand the ways in which this social poetry reflects and molds the thinking of its audiences and practitioners in many parts of the world today. The content and varied methods of epic performance in Egypt, among the Nyanga of Africa, in Central Asia, and in north and central India. Emphasis is ethnographic and aesthetic: on the epic as crafted, meaning-rich performances, and on the role of such performances in the everyday life of common people. GER:3a,4a (DR:2 or 8)

3-4 units, Aut (Martin)

133. Invention of Science—Does science have to be the way it is? Does it have to be at all? Science as we know it was created in the ancient Greek world. The Greeks invented powerful concepts such as Nature and Rationality, and Proof, and the Greeks created a whole range of fields from biology to geometry. The Chinese had a separate invention of science. The two are compared and assessed to the extent to which contemporary science is still "Greek science." GER:3b (DR:9)

3-4 units, Aut (Netz)

139. Medicine in Ancient Greece and Rome—Contemporary medical practice traces its origins to the creation of “Scientific Medicine” by Greek doctors, e.g., Hippocrates and Galen. Is this something modern medicine can be proud of? The scientific achievements and the ethical limitations of ancient medicine are compared. Contemporary ideas and practices that had their beginning in the ancient world, a world where “scientific medicine” was no more than another form of “alternative medicine.” Scientific medicine had to compete in the marketplace of ideas, struggling to be recognized where the boundaries between the scientific and social aspects of medicine were difficult to draw. This background for the creation of modern medicine helps us understand better the interaction between medicine and society in our own culture. 4 units, given 2001-02

169. Introduction to the Ethics of Socrates, Plato, and Aristotle—The ethical philosophies of Socrates, Plato, and Aristotle, and its relation to traditional Greek notions of goodness and happiness. The ideological systems (gender, sexuality, race, and class) which these thinkers set out to corroborate or contest. The nature of philosophic language and its relation to other kinds of discourse (especially poetry and rhetoric).

4-5 units, given 2001-02

176. Majors Seminar: Interpreting Antiquity—The literary history of Greek and Roman poetry. Discussions of epic, lyric and dramatic texts
32A,B. Serious Laughter, Fantasy, and Invective in Ancient Greece
—(Enroll in Introduction to the Humanities 32A,B.) and Beyond
—(Enroll in Introduction to the Humanities 31A,B. Ancient Empires
is an interesting literary and historical study. Students explore Horace's Odes
influenced by ideas in prescribed school texts, e.g., the Civil Service depended heavily on success in examinations in Latin, was
influenced by ideas in prescribed school texts, e.g., the
Odes of Horace. Horatius Flaccus, son of a freedman and on the wrong side at Philippi, and his admirer Rudyard Kipling, a myopic journalist excluded from
athletic or military pursuits, are unlikely prophets of empire. Kipling refers to Horace throughout his life as a writer, often parodies him, and was one of those responsible for the spoof "fifth book of Horace's Odes.
The "dialogue" between the two about defeat, victory, and right conduct is an interesting literary and historical study. Students explore Horace's Odes (in translation) and a selection of Kipling's writings in prose and verse. GER:3a (DR:8)
3-4 units, Win (Treggiari)

31A,B. Ancient Empires—(Enroll in Introduction to the Humanities 31A,B.)
5 units, Win (Morris)
Spr (Trimble)

32A,B. Serious Laughter, Fantasy, and Invective in Ancient Greece and Beyond—(Enroll in Introduction to the Humanities 32A,B.)
4-5 units, Win (Martin)
Spr (Connolly)

101A. Reading Tutorial in History—In Greek.
3-4 units, any quarter (Staff)

102. Roman History I: The Republic—How did Rome grow from a village to the capital of a Mediterranean empire? The underlying factors of culture, customs, and structures of Rome in the context of a world of tribes and city-states. GER:3a (DR:8)
4-5 units, Win (Treggiari)

103. Roman History II: The Empire—The Roman Empire from the dictatorship of Julius Caesar and the Principate of Augustus through the consolidation of the system and the brink of its later crisis. Emphasis is on the achievement of Augustus in establishing a constitutional system, the Principate, which gave relative peace and security to the Roman world for 250 years; the subsequent history of the Julio-Claudian dynasty; the life and culture of the empire (Mediterranean lands and Europe) during the first two centuries A.D.; and the contribution of Rome to the cultures of western Europe and its successors (e.g., literature, architecture, law, the transmission of Greek and Judeo-Christian ideas, and the acculturation of Romans to non-Romans and the non-transmission of Roman culture elsewhere). Contemporary texts and archaeological data where possible. GER:3a (DR:8)
4-5 units, Spr (Treggiari)

105. History and Culture of Egypt—Survey of the history and culture of ancient Egypt from the pre-dynastic, 3100 B.C., through the early Christian period, A.D. 500. Emphasis is on historical development and continuity and the contribution of Egyptian culture to other Mediterranean societies. GER:3a,4a (DR:2 or 8)
4-5 units, Spr (Manning)

108A. Reading Tutorial in Late Antiquity—In Greek or Latin.
3-4 units, any quarter (Staff)

180. The Logic of History—How can we understand the human past? Ideas have changed so much in the past 30 years that some critics suggest that we no longer write history. How do historians advance and sustain arguments? What is historical evidence, and how do historians make sense of it? What rules of argument apply in different kinds of history and how do these differ from those found in other parts of the social sciences and humanities? What is historical truth? Can we ultimately make sense of the past? GER:3a (DR:8)
5 units, Win (Morris)

19N. Stanford Introductory Seminar: Horace, Kipling and Imperialism, Songs, and Law—Preference to freshmen. British thinking about empire in the 19th century, when admission to the army and the Indian Civil Service depended heavily on success in examinations in Latin, was influenced by ideas in prescribed school texts, e.g., the Odes of Horace. Horatius Flaccus, son of a freedman and on the wrong side at Philippi, and his admirer Rudyard Kipling, a myopic journalist excluded from athletic or military pursuits, are unlikely prophets of empire. Kipling refers to Horace throughout his life as a writer, often parodies him, and was one of those responsible for the spoof "fifth book of Horace's Odes.
The "dialogue" between the two about defeat, victory, and right conduct is an interesting literary and historical study. Students explore Horace's Odes (in translation) and a selection of Kipling's writings in prose and verse. GER:3a (DR:8)
3-4 units, Win (Treggiari)

129. Materials in Archaeology and their Survival—Archaeological artifacts from Old and New World antiquity are most often found in ceramic, stone, metal, glass, textiles, wood products, bone, and related organisms. Artifacts may be in composite forms of multiple materials, studied with the appropriate technology to produce selected artifacts and the long-term characterizations through durability, workability, availability, etc. The survival of each material is examined in the context of environmental factors that enhance or detract from preservation and in the presence of water, heat, temperature, oxidation, etc. Weekly labs and workshops.
3-4 units, Win (Treggiari)

100A/200A. Archaic Greek Art—(Same as Art and Art History 101/301.)
4 units, Aut (Hunt)

100B/200B. Classical and Hellenistic Greek Art—(Enroll in Art and Art History 102/302.)
4 units, Win (Maxmin)

100C/200C. Roman Art—(Same as Art and Art History 104/304.)
4 units, Spr (Maxmin)

202C. Colloquium: Aspects of Later Greek Art—(Same as Art and Art History 201.)
4 units (Maxmin) not given 2000-01

INDIVIDUAL STUDY
These courses have department prefix 378.

160. Directed Reading (Undergraduate)
1-15 units, any quarter (Staff)

199. Undergraduate Thesis
6-10 units, any quarter (Staff)

260. Directed Reading (Graduate)
1-15 units, any quarter (Staff)

360. Dissertation Research
1-15 units, any quarter (Staff)
GRADUATE SEMINARS

Graduate seminars vary each year. The following are given this year.

ANTICENT HISTORY [371]

300. The Problem of the East in Archaic Greece—Around 1000 B.C., Greece was virtually cut off from Egypt and the Near East; three centuries later, every aspect of Greek life was permeated by the east, and a full blown "orientalizing" movement was underway. Emphasis is on the poetry, archaeology, and art history of archaic Greece. Why were the archaic Greeks so bitterly divided over the meanings of the east and its place in the good society? Why has the question of the relationships between the Greeks and the east caused such anxieties among modern scholars? Methodological questions are raised about how to analyze and integrate material and textual data, and theoretical questions about how to ground discursive conflicts in material forces.

4-5 units, Spr (Morris)

389. Approaches to Roman History, Cicero—Open to Ph.D. candidates from other departments, advanced Classics majors, and others. Introduction to the subject matter, problems, and methods of Roman historians. Student presentations (orally and in writing) are chosen in the light of their interests and previous experience with some focus on texts that form part of the Classical reading list and on preparation for the General Examination. Emphasis is on the letters and speeches of Cicero from c. 68 to c. 49 B.C. Texts in Latin, translation, or both.

4-5 units, Spr (Treggiari)

ART AND ARCHAEOLOGY [372]

300. The Problem of the East in Archaic Greece—See Ancient History above.

4-5 units, Spr (Morris)

305. Corinth: A Case Study in Archaeology—The case study of a Greek city state of the mid-1st millennium B.C. is used to explore effective research design and implementation in archaeology. Corinth provides a detailed and substantive introduction to the early years of the city and state in the Mediterranean, while its study provides models of source criticism, archaeological survey and fieldwork, and the interpretation of material culture. Emphasis is on the articulation of theory and practice and complementary use of cross-disciplinary quantitative and qualitative methodologies.

4-5 units, Spr (Sanks)

306. Archaeologies of the Contemporary Past—Traces of the past are all around us. They are growing in significance as sources of security and identity, personal and cultural. What is being done with the remains of the past? Topics: collections (museums, antiques, memorabilia); time, ruin, and the modern imagination; photography; forensic science; metaphors of depth, traces and excavations; tourism and the culture industry; the anthropology of everyday life. Case studies in museum interpretation, battlefield archaeology, oral history, autobiography, walking and rambling, tour guides and travel writing, land art, experimental theater, the analysis of garbage, gothic fiction, and polar exploration.

5 units, Win (Shanks)

307. Art and Text in the Roman World—Roman culture was profoundly shaped by stories and symbolic frameworks articulated and experienced through visual images, ritual, text, spectacle, and performance. Scholars have access to this world primarily through written sources and visual imagery, but disciplinary divides mean that these are difficult to juxtapose with rigor or depth. The relationship of text and art is examined in terms of collective knowledge among makers and audiences, shared structural features, and issues of audience. Potential themes: visual and textual literacies, aesthetics, narrative, cultural identity and politics, memory and appropriation.

5 units, Win (Trimble)

GREEK [373]

300. Poetics of the Iliad—Focus is on selected books of the poem in Greek (1, 3, 6, 9, 10, 11, 16, 18, 24) while reading the entire poem in English. Emphasis is on learning in detail Homeric conventions of verse-making, scene-construction, characterization, and motif, and applying these to the interpretation of the poem. The relationships of Homeric epic to Cyclic material; inter- and intratextuality; the definition of the formula, the textual transmission of the poem as it affects our knowledge of conventions; traditional referentiality; myth, ritual, and poetry interconnections.

5 units, Aut (Martin)

301. Greek Religion: The Public Record—Studying Greek writing in the service of religion: dedications, monuments, markers of sacred boundaries, sacrificial calendars, purification rules, sacred inventories, prescriptions and records of festivals, gold tablets to accompany the dead, etc.

5 units, Win (Jameson)

LATIN [375]

307. The Augustan Age

5 units, Win (Barchiesi)

GENERAL [378]

306. The Problem Plays in Greek Tragedy—Four plays, Sophocles' Electra and Philoctetes, and Euripides' Alcestis and Electra, have differences of interpretation so vast as to be chaotic. Some parts of the texts are selected, practicing textual criticism. Discussions and debates on the meanings of the plays, and formulating the key issues in these magnificent but elusive dramas.

5 units, Win (McCall)

AFFILIATED DEPARTMENT OFFERINGS

COMPARATIVE LITERATURE

314. Epic and Empire

5 units, Spr (Parker)

CULTURAL AND SOCIAL ANTHROPOLOGY

137. Introduction to Skills in Archaeology

5 units, Spr (Hodder)

259. Approaches to the Body

5 units, Spr (Hodder)

273. Introduction to Archaeological Theory

5 units, Aut (Hodder)

COMMUNICATION

Emeriti: (Professors) Elie Abel, Richard A. Brody, Steven H. Chaffee, James Risser; (Professors—Teaching) Ronald Alexander, Marion Lewenstein

Director, Institute for Communication Research: Donald F. Roberts

Director, John S. Knight Fellowships for Professional Journalists: Jim Bettinger

Director, Documentary Film and Video: Jan Krawitz

Director, Journalism: Theodore L. Glasser

Deputy Director, John S. Knight Fellowships for Professional Journalists: James R. Bettinger

Professors: Henry S. Breitrose, Theodore L. Glasser (on leave Spring), Shanto Iyengar, Jan Krawitz, Clifford I. Nass, Byron B. Reeves, Donald F. Roberts

Assistant Professors: François Bar (on leave Autumn), Laura Leets (on leave Autumn)

Professor (Teaching): James Bettinger

Lecturers: Vivian Kleiman, Jay Rosenblatt, James Wheaton

Visiting Professors: Dale Maharidge, James Potter, William Woop
The Department of Communication engages in research in communication and offers curricula leading to the A.B., A.M., and Ph.D. degrees. The A.M. degree prepares students for research on mass media or for careers in journalism or documentary film and video. The Ph.D. degree leads to careers in teaching and research-related specialties.

The Institute for Communication Research offers research experience primarily to advanced Ph.D. students.

The John S. Knight Fellowship Program brings promising mid-career professional journalists to the University to study for nine months in a nondegree program. Six International Fellows are sponsored by the Knight Foundation, the Knight Foundation, and others join twelve U.S. journalists.

ADMISSION

Prospective Undergraduate Students—Write to the University's Office of Undergraduate Admissions, Stanford University, Stanford, California 94305.

Prospective Graduate Students—Write to the Registrar's Office, Stanford University, Stanford, CA 94305-3005. Online applications are also readily available via the web at http://www.applyweb.com/aw/stanford.

The department requires that applicants for graduate admission submit verbal and quantitative scores from the Graduate Record Examination (GRE). Admission to each graduate degree program is competitive based on the pool of applicants each year rather than on standard criteria that can be stated in advance.

UNDERGRADUATE PROGRAMS

BACHELOR OF ARTS

PREPARATION

Before declaring the major, students must have completed or be concurrently enrolled in two of the following courses: Communication 1, 106 or 108; and Statistics 60 or Psychology 10. Students interested in declaring the major should see peer advisers or the Student Services Administrator in Building 120, room 434 during the scheduled office hours.

PROGRAM OF STUDY

The undergraduate curriculum is intended for liberal arts students who wish to develop a fundamental understanding of communication in society, drawing on the perspective of the social sciences. Undergraduate students majoring in communication are expected to become acquainted with the fundamental concerns, theoretical approaches, and methods of the field, and to acquire advanced knowledge in one or more of the subareas of communication institutions, processes, and effects.

While the department does not attempt to provide comprehensive practical training at the undergraduate level, the curriculum provides opportunities for professional print journalism as well as internships opportunity.

The department is committed to providing students with the analytical and critical skills that are necessary for future success, be it in graduate programs, professional schools, or immediate career entry.

The major is structured to provide several levels of study: a core curriculum, intended to expose students to a broad-based understanding of communication theory and research, and a number of intermediate-level options and electives. Majors also have the opportunity to do advanced research in the form of senior projects and honors theses.

All undergraduate majors are required to complete a set of core Communication courses which include 1, Mass Communication and Society (5 units); 141A or 141B, History of Film (WIM, 5 units), 106, Communication Research Methods (5 units); and 108, Communication Process and Effects (5 units).

Students must also complete an introductory course in statistics (typically Psychology 10 or Statistics 60) in preparation for courses in methodology and advanced courses in communication processes and effects. It is recommended that this be done as soon as possible so as not to prevent registration in a course requiring statistical understanding.

In addition to the core courses and the statistics requirement, undergraduate majors select courses from the areas described below. Many of the courses require core courses as prerequisites.

Area I: Communication Processes and Effects—Area I emphasizes ways in which communication scholars conduct research in, and consider the issues of, human communication. These studies aim to provide expert guidance for social policy makers and media professionals. A minimum of two courses must be taken from Communication 127, 130, 137, 155, 160, 162, 166, 169, 170, 172.

Area II: Communication Systems/Institutions—Area II considers the roles and interaction of institutions such as broadcasting, film, journalism, constitutional law, and business within communication and mass communication contexts. A minimum of two courses must be taken from Communication 116, 122A or B, 125, 144F, 131, 133, 141A or B, 142, 178, 183.

Tracks—The communication curriculum is designed to provide a theoretical base that can be effectively applied to numerous environments. The potential tracks listed below are not required, but are examples of how to focus your interests.

1. Communication Technologies
   a) Department of Communication:
      137. U.S. Communication Policy
      166. Communication Policy in Comparative Perspectives
      169. Communication, Technology, and Society
      172. Psychological Processing
      183. Media Economics
   b) Affiliated department offerings (elective credit toward the major):
      1) Computer Science (CS)
      CS 105. Introduction to Programming (HTML and JavaScript)
      CS 147. Introduction to HCI
      CS 247A. Interaction Design Studio
      CS 201/STS 215. Computers Ethics and Social Responsibility
   2) Science, Technology, and Society (STS)
      STS 101. Science, Technology, and Contemporary Society
      STS 163. Sciences of the Mind, Post-WW II

2. Communication and Public Affairs
   a) Department of Communication
      137. U.S. Communication Policy
      125. Perspectives on American Journalism
      130. Language and Interpersonal Communication
      133. Communication and Culture
      155. Interracial Communication
      160. The Press and the Political Process
      170. Communication and Children
      183. Media Economics
   b) Affiliated department offerings (elective credit toward the major)
      1) Political Science
      101P. Politics of Public Policy
      184. Issues of Representation in American Politics
   2) Department of Psychology
      142. Social Development
      161. Cultural Psychology
      167. Seminar on Aggression
      180. Social Psychological Perspectives on Stereotyping and Prejudice
   3) Public Policy Program
      104. Economics and Public Policy
      194. Technological Policy

3. Media Practices and Performance
   a) Department of Communication
      122A or B. Documentary Film
      125. Perspectives on American Journalism
      131. Media Ethics and Responsibilities
      141A or B. Film History
      142. Broadcasting in America
      160. The Press and the Political Process
      178. Newsroom Management
The remainder of the 60 required units may be fulfilled with any elective communication courses, or cross-listed courses in other departments.

To be recommended for the A.B. degree in Communication, the student must complete at least 60 units (approximately twelve courses) in the department. No more than 10 units of transfer credit or Summer Session may be applied to meet department requirements. Communication majors must receive a letter grade for all communication courses unless they are offered only for satisfactory/no credit (S/NC).

**Internship Opportunities**—Internship credit is available for Communication undergraduates and minors. For communication majors/minors interested in Journalism internships, select the "Internship Office" (http://www.stanford.edu/dept/communication/) for current internship possibilities. Communication students who have received academic credit for internship experience through Communication 185 have prepared reports, which are available in the Communication Library.

**MINORS**

**PREPARATION**

Before declaring the minor, students must have completed or be concurrently enrolled in two of the following courses: Communication 1, 106 or 108; and Statistics 60 or Psychology 10. Students interested in declaring the minor should launch the registrar’s website (www-leland.stanford.edu/dept/registrar/) to apply for the minor.

**PROGRAM OF STUDY**

The minor is structured to provide a foundation for advanced course work in communication through a broad-based understanding of communication theory and research.

The minor in Communication consists of three introductory Communication core courses which include 1, Mass Communication and Society (5 units); 106, Communication Research Methods (5 units); and 108, Communication Process and Effects (5 units).

In addition to core courses, the minor requires a minimum of five intermediate-level elective courses in the department. The department also requires completion of or concurrent registration in an introductory statistics course (Statistics 60, 70, or Psychology 10) prior to registration in Communication 106, Communication Research Methods. It is strongly recommended that the course in statistics be taken as early as possible, preferably in the Autumn Quarter of the junior year.

Students interested in declaring a minor must do so no later than registration day in the Autumn Quarter of the junior year. Core courses are offered only once annually, and they constitute a sequence:

Prerequisite: introductory statistics course (for example, Psychology 10)

Core Courses: Communication 1, 106, 108
Area I, Communication Processes and Effects. A minimum of one course from Communication 127, 130, 137, 155, 160, 162, 166, 169, 170, 172
Area II, Communication Systems and Institutions. A minimum of one course from Communication 116, 122A,B, 125, 131, 133, 141A,B, 142, 178, 183

Plus three elective courses

Some courses are not offered every year. Refer to program handout and the Time Schedule for details.

**HONORS PROGRAM**

The honors program provides undergraduates the opportunity to undertake a significant program of research in an individual professor/student mentoring relationship. The aim is to guide students through the process of research, analysis, drafting, rethinking, and redrafting, which is essential to excellence in scholarship. Working one-on-one with a faculty adviser, seniors may earn between 5 and 15 Communication units, culminating in an honors thesis. In order to be eligible for the honors program, interested majors must have: (1) successfully completed both a research methods and statistics course, (2) selected an adviser, and (3) submitted an application to the department by the end of their junior year. Applications may be picked up outside of room 110 of Building 120.

A final copy of the honors thesis must be read and approved by the adviser and submitted to the department by the eighth week of Spring Quarter (exact date to be arranged). It becomes part of a permanent record held by the department. Honors work may be used to fulfill Communication elective credit but must be completed and a letter grade submitted prior to graduation. A student failing to fulfill all honors requirements may still receive independent study credit for work completed and it may be applied toward fulfilling major requirements.

The designation "graduation with honors" is awarded by the Department of Communication to those graduating seniors who, in addition to having completed all requirements for the Communication major:

1. Complete an honors thesis
2. Maintain a distinguished grade average in all communication course work
3. Are recommended for distinction by the Communication faculty

**COTERMINAL PROGRAM**

The Department of Communication offers students who are completing an A.B. in another department, a coterminal program with an A.M. emphasis in Media Studies (see Media Studies Program below for more information); applications can be picked up at Degree Progress, the Registrar’s Office, room 132, Old Union.

Applications for coterminal study must be submitted at least four quarters in advance of the expected master’s degree conferral date. Stanford undergraduates may apply as early as the eighth quarter (or upon completion of 105 units), but no later than the eleventh quarter of undergraduate study. Requirements include: Application for Admission to Coterminal Master’s Program form, preliminary program proposal, statement of purpose, three letters of recommendation from Stanford professors, and a current Stanford transcript. GRE scores are no longer required. Coterminal applications are submitted directly to the department. Review procedures and the Graduate Admissions Committee determines criteria.

**GRADUATE PROGRAMS**

**MASTER OF ARTS**

University requirements for the master’s degree are described in the “Graduate Degrees” section of this bulletin.

The department awards terminal A.M. degrees in Journalism and Documentary Film/Video. Applicants for each program, and for doctoral work, are evaluated for admission on different criteria. A student may complete more than one A.M. degree in the department, but course work applied to the requirements for one A.M. degree may not be applied to a second. All work to fulfill graduate degree requirements must be in courses numbered 100 or above.

Students who complete an A.M. degree and who desire entry into the Ph.D. program must file a Graduate Program Authorization Petition application, which can be picked up at Graduate Degree Progress, room 132, Old Union. Such students are considered alongside all other doctoral applicants.

**DOCUMENTARY FILM AND VIDEO**

The graduate program in documentary film and video is a master's program designed to train students in the conceptual and craft skills for the production of nonfiction film and video.

**RESIDENCY**

The program requires continuous enrollment for a period of two academic years, with a completion date of June in the second year.

Students proceed through the program as a cohort. The degree requires three full terms of registration in the first year. In the second year, full-time registration is required in Winter Quarter, with half-time registration in the other remaining two quarters. Full-time registration consists of a minimum of 11 units; half-time registration consists of 9 units. The residency requirement is calculated on the basis of terms of registration and not on the basis of total number of units earned. The program does not allow for leaves of absence.
The curriculum is intended to teach an array of technical and conceptual skills as well as relevant historical and theoretical knowledge.

First-Year Curriculum

Autumn Quarter

- 200. Media Narrative
- 202A. Graduate Colloquium in Film and Television
- 223A. Documentary Film/Video Directing I
- 224A. Film Production I

Winter Quarter

- 202B. Graduate Colloquium in Film and Television
- 223B. Documentary Film/Video Directing II
- 224B. Film Production II

Spring Quarter

- 222A. Documentary Film
- 222B. Documentary Film
- 223C. Documentary Film/Video Directing III
- 224C. Film Production III

Elective (3-5 units)

Second-Year Curriculum

Autumn Quarter

- 202A. Graduate Colloquium in Film and Television
- 292A. Documentary Film/Video A.M. Project Seminar I

Winter Quarter

- 202B. Graduate Colloquium in Film and Television
- 292B. Documentary Film/Video A.M. Project Seminar II

Spring Quarter

- 202C. Graduate Colloquium in Film and Television
- 292C. Documentary Film/Video A.M. Project Seminar III

Electives

Up to three electives may be from Department of Communication courses, including the required two-course sequence of documentary history classes taken in the Autumn Quarter of the first and second year. Some elective courses are not offered every year, and there may be time conflicts with core courses. Students should consult the University Time Schedule each quarter for current information.

Each term, courses that are relevant to the curriculum may be offered by other departments at Stanford. At least one elective must be taken outside the department. A list of approved electives, both within and outside the department, is provided each quarter. Other electives relevant to the subject matter of the A.M. project may be substituted, with permission of the adviser.

Equipment and Supplies

The department maintains film and video production facilities for teaching and research purposes. However, the costs of supplies and processing services are the responsibility of the students.

Material costs are approximately $1,800 for the first year of residence. In the second year, costs vary depending on subject, format/length, and logistics, but $3,000-5,000 is typically the minimum average cost of an A.M. project.

A.M. Project

In the second year of the program, each student produces an A.M. project which consists of a 15-20 minute film or video documentary. In order for students to have sufficient time to complete their own A.M. projects and gain the experience of assisting others, shooting must begin prior to Thanksgiving break, and shooting days are limited to a total of ten.

Students own their own work, but the department reserves the right to use student projects for non-profit University-related purposes.

In order to graduate, students must deposit with the faculty adviser Beta SP and VHS copies of their film or video project and a revised final budget that reflects the projected and actual cost of their production. In the case of film, the Beta SP copy must be made once the film is printed and in the case of video, the Beta SP copy must be made from the on-line master. Students must contact the department's Student Services Administrator during the quarter in which they expect to graduate in order to determine what needs to be done to file for graduation. Students working in film may not have completed their final printing work prior to the end of the Spring Quarter. It is therefore possible for a student to officially graduate in the Summer Quarter immediately following their enrollment in Communication 292C, although they will not have access to facilities during this period. No extensions or leaves of absences are granted.

All A.M. projects must be completed by the end of the Spring Quarter of the second year. In the case of video, the student must have completed on-line editing, and in the case of film, the student must have completed the final sound mix. The A.M. projects are screened for the public during Commencement weekend.

Journalism

Stanford's Graduate Program in Journalism focuses on the knowledge and skills required to report, analyze, and write authoritatively about public issues. The curriculum combines a sequence of specialized reporting and writing courses with seminars and courses devoted to deepening the students' understanding of the roles and responsibilities of American news media in their coverage of public issues.

The program emphasizes both rigorous preparation for the practice of journalism as well as a critical perspective from which to understand it. The program's objective, then, is twofold: (1) to graduate talented reporters and writers who will foster public understanding of the significance and consequences of public issues and the debates they engender; and (2) to graduate thoughtful journalists who will respond openly and eloquently when called on to explain and defend the methods of their reporting and the quality of their writing.

Curriculum

The curriculum includes eight required courses, including a master's project:

- 215. Journalism Law
- 217. Journalism and the Internet
- 225. Perspectives on American Journalism
- 250. The Press and the Political Process
- 273. Public Issues Reporting I
- 274. Public Issues Reporting II
- 289. Journalism A.M. Project
- 291. Graduate Journalism Seminar

Additionally, students are required to take two specialized writing courses, typically one each during Winter and Spring quarters; one or two approved electives from among graduate-level courses in the Department of Communication; and one or two approved electives from among courses on campus that deal substantively with issues of public importance. The A.M. degree in communication (journalism) requires 51 units.

A typical schedule follows:

Autumn Quarter

- Public Issues Reporting I
- Perspectives on American Journalism
- Journalism Law
- Graduate Journalism Seminar
- Elective

Winter Quarter

- Public Issues Reporting II
- Internet and the Newsroom
- Specialized Writing
- Graduate Journalism Seminar
- A.M. Project
- Elective

Spring Quarter

- The Press and the Political Process
- Specialized Writing
- Graduate Journalism Seminar
- A.M. Project
- Elective

Journalism Project

The master's project, a requirement for graduation, is intended as an opportunity for students to showcase their talents as writers and reporters. It is also an opportunity to undertake an in-depth critique of an area of journalism in which the author has a special interest. Work on the project usually begins during the Winter Quarter and continues through
MEDIA STUDIES

The Media Studies coterminous master’s program provides a broad introduction to scholarly literature in mass communication. This one-year program is designed for Stanford students without prior academic work in communication, who wish academic preparation for teaching. Media Studies students need to satisfy four basic requirements:

1. **Required Units and GPA:** students must complete 42 units in Communication and related areas, including items 2 and 3 below. Normally a grade point average (GPA) of 'B' (3.0) or better satisfies the requirement for high academic standing. To count toward the 42 units, courses in related areas outside the department must be approved by the student’s adviser.

2. **Core Requirements:** students must complete Communication 206, 208, and a statistics course. Typically, the statistics requirement is met with Statistics 160 or 190. Other courses occasionally are approved as substitutes. For example, in 1999-2000, Sociology 281 B satisfied the statistics requirement.

3. **Six Media Studies Courses:** students must complete a minimum of six additional Communication courses from the following list of department courses concerned with the study of media. While the department also offers graduate-level courses teaching media-related skills (for example, Communication 273 or 277), these courses are intentionally excluded from the list. Not all the listed courses are offered every year and the list may be updated from one year to the next. However, its intent is to include only courses in media studies, not media skills.

   - 201. Film Aesthetics
   - 211. Mass Communication and Society
   - 216. Media Law
   - 217. Journalism and the Internet
   - 225. Perspectives on American Journalism
   - 227. Media Violence
   - 230. Language and Interpersonal Communication
   - 231. Media Ethics and Responsibility
   - 233. Communication and Culture
   - 237. U.S. Communication Policy
   - 241. History of Film
   - 242. Broadcasting in America
   - 255. Interethic Communication
   - 260. Political Communication
   - 262. Analysis of Presidential Campaigns
   - 266. Communication Policy in Comparative Perspectives
   - 269. Computers and Interfaces: Psychological and Social Issues
   - 270. Communication and Children
   - 272. Psychological Processing of Media
   - 280. Film Criticism
   - 283. Media Economics
   - 318. Doctoral Research Methods II*
   - 319. Doctoral Research Methods III*

4. **Two Extensive Papers:** students complete papers in two of the required communication courses listed in item 3 above. The papers requirement is intentionally flexible to permit students to adjust it to their interests, in consultation with professors.

   a) Each paper must grow out of a communication course the student has taken.

   b) Papers must be supervised by a faculty member, typically the professor who taught the course that inspired the paper (but not necessarily the student’s adviser for the Media Studies program). Only a faculty member, not a Ph.D. student, can approve a topic and supervise a paper.

* These courses are designed for Ph.D. students. Master’s students are unlikely to be admitted to them, but the final decision is up to the faculty.

Additional courses are selected in consultation with an academic adviser. A course in statistical methods is strongly recommended.

DOCTOR OF PHILOSOPHY

University requirements for the Ph.D. are described in the “Graduate Degrees” section of this bulletin.

The department offers the Ph.D. in Communication Theory and Research. First-year students are required to complete introductory courses in communication theory and research, research methods, and statistics. These core courses are grounded in the social science literature emphasizing how people respond to communication and media and how media institutions function. In addition, Ph.D. students must complete a minimum of three literature survey courses and three advanced seminars in communication and related departments. Each student builds a research specialty relating communication to current faculty interests in such areas as children, ethics, ethnic identity, human-computer interactions, information processing, information technology, law, and politics and voting. Regardless of the area of specialization, the Ph.D. program is designed primarily for students interested in teaching and research careers or policy formation positions.

The Ph.D. program encompasses four years of graduate study (subsequent to completion of the A.B. degree) during which, in addition to fulfilling University residency requirements, Ph.D. candidates are required to:

1. Complete all departmental course requirements with above average graduate grades, normally defined as a minimum grade point average (GPA) of 3.5. Currently these courses include Communication 206, 208, 311, 317, 318, 319, and a sequence in statistics (for example, Statistics 160) that includes multiple regression and complex analysis of variables.

2. Pass the general qualifying examinations by the end of the second academic year of study and pass a specialized area examination by the end of the third academic year of study.

3. Demonstrate proficiency in tools required in the area of research specialization. Chosen with the advice of the faculty, such tools may include advanced statistical methods, computer programming, a foreign language, or other technical skills.

4. Complete two predissertation research projects.

5. Teach or assist in teaching at least two courses, including Communication 1.

6. Complete a dissertation satisfactory to an advisory committee of three or more faculty members.

7. Pass the University oral examination, which is a defense of the dissertation.

Because the multifaceted nature of the department makes it possible for the Ph.D. student to emphasize several areas of communication study, there tend to be several “typical” programs of course work followed by students, depending on their specialties. Variation in the course program occurs after the first year of graduate study; the first year is devoted primarily to the “core” courses required of all doctoral students.

In addition, students must complete other advanced Communication theory and research courses preparatory to their particular specializations. Specification of these courses depends on (1) individual student needs to prepare for preliminary and area examinations, and (2) the requirements of the particular area of emphasis chosen by the student.

Ph.D. candidacy is valid for five years. Extensions of candidacy are rarely granted and require reexamination.

Ph.D. MINOR

Candidates for the Ph.D. degree in other departments who elect a minor in Communication are required to complete a minimum of 20 units of graduate courses in the Department of Communication, including a total of three theory or research methods courses, and are examined by a representative of the department. A department adviser in consultation
with the individual student determines the particular communication
theory and methods courses.

THE INSTITUTE FOR COMMUNICATION
RESEARCH

The institute is an office of project research for the faculty of the
Department of Communication and operates under grants to faculty from
foundations, communication media, and other agencies. Research assis-
tantships are often available to qualified Ph.D. students in communica-
tion.

COURSES

(WIM) indicates that the course meets the Writing in the Major re-
quirements.

PRIMARILY FOR UNDERGRADUATES

1. Mass Communication and Society: Media Technologies, People,
and Society—(Graduate students register for 211.) Open to non-majors.
Introduction to the fundamental concepts and contexts of communica-
tion. A topics-structured orientation emphasizing the field and the scholar-
ly endeavors represented in the department. Lectures and discussion
sections. GER:3b (DR:9)
5 units, Aut (Nass)

101. Film Aesthetics—(Graduate students register for 201.) Theoreti-
cal, historical examination of the nature of the film medium. Emphasis
is on the problems of aesthetics and communication from the viewpoints
of practitioners, critic, and audience.
5 units (Breitrose) not given 2000-01

104. Reporting and Writing the News—Reporting and writing, em-
phasizing various forms of journalism: news, interpretation, features,
opinion. Detailed criticism of writing.
5 units, Win, Spr (Staff)

106. Communication Research Methods—(Graduate students register
for 206.) The conceptual and practical concerns underlying commonly
used quantitative approaches (experimental, survey, content analysis,
and field research) in communication. Students become acquainted with
the techniques of research so they may become intelligent consumers and
practitioners of research. Lectures and discussion sections. Recommended:
1 or Psychology 1.
5 units, Win, Spring (Leets)

108. Communication Process and Effects—(Graduate students regis-
ter for 208.) The process of communication theory construction, includ-
ing a survey of social science paradigms and major theories of commu-
nication. Lectures/discussion. Recommended: 1 or Psychology 1.
5 units, Aut (Potter)

113Q. Stanford Introductory Seminar: New Media—The Future of
the News—Preference to sophomores. News that sells you merchandise,
news written by reporters with stock options on producing news formats,
news that comes at you 24 hours a day via computer screen, pager, cell
phone: is this good or bad? Will these new media formats change how
you participate in democratic institutions? The instructor’s research on
how people read news online has tracked how user eyes move about
scrolling screens and move from site to site. Discussions on this research,
findings from other scholars, and possible participation ongoing re-
search. Students may tutor and record how different ethnic groups use
online news.
3-5 units, Win (Lewenstein)

116. Journalism Law—(See 216.)
5 units, Aut (Wheaton)

117. Journalism and the Internet—(Graduate students register for
217.) Preference to Communication seniors. The implications of new
media for journalists. Professional and social issues related to the Internet
as a case of new media deployment, as a story, as a research and reporting
tool, and as a publishing channel. Seminar discussion and hands-on
practicum. Prerequisite: consent of instructor.
5 units, Win (Bar)

122A. Documentary Film—(Graduate students register for 222A.)
Analysis of the techniques and strategies of films designed to effect
attitudinal and behavioral change. Prerequisite: consent of instructor.
5 units (Breitrose) alternate years, given 2001-02

122B. Documentary Film—(Graduate students register for 222B.)
Issues in contemporary documentary film/video including objectivity/
subjectivity, ethics, censorship, representation, reflexivity, responsibil-
ty to the audience, and authorial voice. The viewing and analysis of films
has a parallel focus on form and content. Prerequisite: consent of
instructor.
5 units, Win (Krawitz)

125. Perspectives on American Journalism—(Graduate students reg-
ister for 225.) Survey of issues, ideas, and concepts in the development
of American journalism, emphasizing the role of the press in society, the
meaning and nature of news, and professional norms that influence
conduct in and outside of the newsroom. Prerequisite: 1 or junior
standing. GER:3b (DR:9)
5 units, Aut (Glasser)

127. Media Violence—(Graduate students register for 227.) A critical
analysis of the existing knowledge base about violent content in the
media and the effects of exposure to that content immediately and over
the long term. The impact of the shortcomings of the research literature
on the development of policy.
5 units, Aut (Potter)

130. Language and Interpersonal Communication—(Graduate stu-
dents register for 230.) Theory and research regarding language and
interpersonal communication. Issues on the above in relationships (ini-
tiation, maintenance, deterioration); gender; persuasion; and deception
(use and detection).
5 units (Staff) not given 2000-01

131. Media Ethics and Responsibility—(Graduate students register
for 231.) The development of professionalism among American journalists,
emphasizing the emergence of objectivity as a professional and the
epistemological norm. An applied ethics course where questions of
power, freedom, and truth autonomy are treated normatively so as to
foster critical thinking about the origins and implications of commonly
accepted standards of responsible journalism.
5 units, Win (Glasser)

133. Communication and Culture—(Graduate students register for
233.) The relationship between communication and culture, emphasizing
the mass media and their symbolic import. GER:3b (DR:9)
5 units (Glasser) not given 2000-01

137. U.S. Communication Policy—(Graduate students register for
237.) Policy issues surrounding the emergence of a National Information
Infrastructure (NII) in the U.S. Adopting a pluri-disciplinary approach,
examines the historical context of the policy debate, the technical and
business aspects of the networking transformation underway, and its
economic and social dimensions. GER:3b (DR:9)
5 units, Win (Bar)

141A. History of Film: The First 50 Years—(Graduate students
register for 241A.) Studies in the development of the motion picture as
art form and cultural industry. Lab. Screenings of films announced in
class. GER:3b (DR:9) (WIM)
5 units, Win (Breitrose)
141B. History of Film: The Second 50 Years—(Graduate students register for 241B.) The evolution of the motion picture as an art form and culture industry in the U.S. and other nations from 1941. Topics: the decline of the studio system, the impact of WWII, the rise and fall of auteur cinema, television, industrial concentration and its effects, and the "high concept" film. Mandatory evening screenings. (WIM)
5 units (Breitrose) alternate years, given 2001-02

5 units, Spr (Breitrose)

144N. Stanford Introductory Seminar: Film Forum—Preference to freshman. The formal aspects of cinema, and in a general sense, with how form helps create meaning. A full understanding of a film, or any work of culture, is possible only when there is awareness of how it is constructed. The tools of construction are those formal elements of craft which taken together make the work cohere and make sense. In film, these tools are story, script construction, design, direction, acting, camera, sound, editing, and music.
1-3 units, Win (Breitrose)

149Q. Stanford Introductory Dialogue: Interethnic Communication—Preference to sophomore. Through case studies, students gain an understanding of the nature of interethnic relations and discuss effective ways for addressing the problems and issues associated with them.
2 units, Win (Leets)

155. Interethnic Communication—(Graduate students register for 255.) Working from an intergroup perspective, examines the influence of ethnicity on the process of interpersonal communication. The problems and opportunities inherent in communication among people from different ethnic heritages and value orientations, and the steps relevant for improving interethnic communication. GER:3b (DR:9)
5 units, Spr (Leets)

160. The Press and the Political Process—(Graduate students register for 260.) Analysis of the role of mass media and other channels of communication in political and electoral processes. GER:3b (DR:9)
5 units, Spr (Iyengar)

162. Analysis of Presidential Campaigns—(Graduate students register for 262.) Seminar on the evolution of American political campaigns, and the gradual replacement of the political party by the mass media as the key intermediary between candidates and voters. The academic literature on media strategies, the relationship between candidates and the press, the effects of campaigns on voter behavior, and current controversies concerning the apparent inconsistencies between media campaigns and democratic norms. Do media-based campaigns enable voters to live up to their civic responsibility? Has the need for well-financed campaigns increased the influence of elites over the nomination process? Have ordinary citizens gradually become disengaged because of their limited involvement in the process? Discussions are in the context of the 2000 campaign.
5 units, Aut (Iyengar)

166. Communication Policy in Comparative Perspectives—(Graduate students register for 266.) A comparative overview of the ongoing change in the communications policy environment of different countries. How different nations are tackling the transformation, the reasons for these differences, and the impact of distinct policy approaches on the respective national economies and societies. GER:3b (DR:9)
5 units (Bar) not given 2000-01

169. Computers and Interfaces: Psychological and Social Issues—(Graduate students register for 269.) Interdisciplinary approach to issues of human-computer interaction (primarily) and computers and society (secondarily). General models of the link between technology, psychology, and society, addressing the question of which is/are cause and which is/are consequence. Issues: anthropomorphism and interface design; what is a human; conversation and interfaces; metaphors in interfaces; identity, privacy, and computing; and computer-mediated communication. GER:3b (DR:9)
5 units, Win (Nass)

170. Communication and Children I—(Graduate students register for 270.) Developmental approach to how children come to use and process mass media, what information they obtain, and how their behavior is influenced by the media. Prerequisite: 1, Psychology 1, or Sociology 1.
GER:3b (DR:9)
4 units, Win (Roberts)

171. Communication and Children II—(Graduate students register for 271.) Research practicum; limited enrollment. Prerequisites: 170, consent of instructor.
3 units, Spr (Roberts)

172. Psychological Processing—(Graduate students register for 272.) The literature related to psychological processing and the effects of media. Topics: unconscious processing; picture perception; attention and memory; emotion; the physiology of processing media; person perception; pornography; consumer behavior; advanced film and television systems; and differences between reading, watching, and listening. GER:3b (DR:9)
5 units (Reeves) not given 2000-01

177. Specialized Workshops—(See 277.) One or more classes are offered in specializations such as science or opinion writing, or other areas, and are organized around writing projects oriented toward the field of specialization. Prerequisite: advanced Communication undergraduate.
4 units (Staff)

180. Film Criticism—(Graduate students register for 280.) A practical and critical view of film. Readings/discussion consider models of artistic and literary criticism as points of comparison. Weekly reviews stress the analysis of the films and a lucid writing style. Prerequisite: 101 or 141.
5 units, Spr (Breitrose)

183. Media Economics—(Graduate students register for 283.) The economics of communication media. A survey of the economic organization and characteristics of traditional communication sectors (newspaper publishing, film, broadcast and cable TV, telephony). The second half deals in detail with specific, cross-sector economic issues related to networks, media technologies, and digital convergence. Prerequisite: one completed Economics course.
5 units, Spr (Bar)

185. Internship Experience—Professional experience in the media. Prerequisite: Communication major.
1-4 units, Aut, Win, Spr (Staff)

190. Senior Project—Research project or production of a finished piece of work in journalism or film. A combination of the senior project and an internship is possible. Prerequisite: senior standing.
5 units, Aut, Win, Spr (Staff)

195. Honors Thesis—Qualifies students to conduct communication research.
5-15 units, Aut, Win, Spr (Staff)

199. Individual Work—Students with high academic standing are permitted to undertake individual work.
1-4 units, any quarter (Staff)
PRIMARILY FOR MASTER'S STUDENTS

200. Media Narratives—Required of all entering A.M. graduate students in communication. Narrative as a means of shaping the production and study of media. Lectures/discussions and projects on narrative form in research design, the web, journalism, and film and video production. Prerequisite: A.M. student in Communication

1-4 units, Aut (Reeves, Samuelson)

201. Film Aesthetics—Graduate section; see 101.

202A,B,C. Graduate Colloquium in Film and Television—Topics in film and television focusing mainly on production-related issues. Prerequisite: A.M. student in Communication in research design, the web, journalism, and film and video production.

1 unit, Aut (Krawitz)
Win (Samuelson)
Spr (Breitrose)

206. Communication Research Methods—Graduate section; see 106.
4 units, Win (Leets)

208. Communication Process and Effects—Graduate section; see 108.
4 units, Aut (Potter)

211. Mass Communication and Society—Graduate section; see 1.
4 units, Aut (Nass)

216. Media Law—Same as 116. Laws and government regulation impacting on journalists. Topics: libel, privacy, news gathering, protection sources, fair trial and free press, theories of the First Amendment, broadcast regulation, etc. Prerequisite: Journalism master students or advanced communication majors.

4 units, Aut (Wheaton)

217. Journalism and the Internet—Graduate section; see 117.
4 units, Win (Bar)

222A. Documentary Film—Graduate section; see 122A.
4 units (Breitrose) alternate years, given 2001-02

222B. Documentary Film—Graduate section; see 122B.
4 units, Win (Krawitz)

223A. Documentary Film/Video Directing I—For graduate students. Emphasis on conceptualizing and executing ideas for the production work done jointly with 224A, covering all aspects of preproduction at an introductory level. Prerequisite: admission to the A.M. Documentary Film and Video program.

5 units, Aut (Rosenblat)

223B. Documentary Film/Video Directing II—For graduate students. Further professional training in preproduction and producing for motion pictures and television. Interview skills and other documentary directing techniques are developed utilizing video. Prerequisite: 223A. Corequisite: 224B.

5 units, Win (Staff)

223C. Documentary Film/Video Directing III—For graduate students. Further examination of structure, emphasizing writing and directing the documentary. Practical training in fundraising and distribution. Prerequisite: 223B. Corequisite: 223C.

5 units, Spr (Samuelson)

224A. Documentary Film Production I—For graduate students. First of a three-quarter sequence leading to professional training in motion picture production. 16mm exercises and a short 16mm non-synchronous film with multiple sound tracks and effects. Corequisite: 223A.

5 units, Win (Krawitz)

224B. Documentary Film Production II—For graduate students. Produce a short 16mm film exercise in color utilizing synchronous sound, with emphasis on observational filming techniques. Prerequisites: 223A, 224A. Corequisite: 223B.

5 units, Win (Krawitz)

224C. Documentary Film Production III—For graduate students. Final quarter of professional training in motion picture production. A five- to seven-minute, 16mm film utilizing skills acquired in 224A,B.

225. Perspectives on American Journalism—Graduate section; see 125.
4 units, Aut (Glasser)

226. Reconstructing Documentary Theory—Seminar addressing current controversies in the theory of the documentary, drawing on the writings of Noel Carroll, Carl Plantinga, Leslie Woodhead, Trevor Ponek, Robert Rosenstone, etc. Topics: the rhetoric of non-fiction, the border between factual and fictional, subjectivity and objectivity, truth claims, reflexivity, and the "art documentary." Prerequisite: graduate standing or consent of instructor.

3-4 units (Breitrose) not given 2000-01

227. Media Violence—Graduate section; see 127.
4 units, Aut (Potter)

230. Language and Interpersonal Communication—Graduate section; see 130.
4 units (Staff) not given 2000-01

231. Media Ethics and Responsibility—Graduate section; see 131.
4 units, Win (Glasser)

233. Communication and Culture—Graduate section; see 133.
4 units (Glasser) not given 2000-01

237. U.S. Communication Policy—Graduate section; see 137.
4 units, Win (Bar)

241A. History of Film: The First 50 Years—Graduate section; see 141A.
4 units, Win (Breitrose)

241B. History of Film: The Second 50 Years—Graduate section; see 141B.
4 units (Breitrose) alternate years, given 2001-02

242. Broadcasting in America—Graduate section; see 142.
4 units, Spr (Breitrose)

4 units (Breitrose) not given 2000-01

255. Interethnic Communication—Graduate section; see 155.
4 units, Spr (Leets)

260. The Press and the Political Process—Graduate section; see 160.
4 units, Spr (Iyengar)

262. Analysis of Presidential Campaigns—Graduate section, see 162.
4 units, Aut (Iyengar)
266. Communication Policy in Comparative Perspectives—Graduate section; see 166.
   4 units (Bar) not given 2000-01

269. Computers and Interfaces; Psychological and Social Issues—Graduate section; see 169.
   4 units, Win (Nass)

270. Communication and Children I—Graduate section; see 170.
   4 units, Win (Roberts)

271. Communication and Children II—Graduate section; see 171.

272. Psychological Processing—Graduate section; see 172.
   4 units (Reeves) not given 2000-01

273. Public Issues Reporting I—Prepares students for the challenges of covering public policy issues and conveying their importance to the public by covering local and state governments and other institutions. The making of public policy, and the process of governmental decisions, including the impact of a variety of forces on government (e.g., public opinion, media attention, interest groups, labor unions, business lobbyists and campaign contributions).
   4 units, Aut (Woo)

274. Public Issues Reporting II—Student teams study one major public policy issue that has broad societal impact. Students report and write individually and as a team produce a body of journalism that advances policy issue that has broad societal impact. Students report and write individually and as a team produce a body of journalism that advances public by covering local and state governments and other institutions. The making of public policy, and the process of governmental decisions, including the impact of a variety of forces on government (e.g., public opinion, media attention, interest groups, labor unions, business lobbyists and campaign contributions).
   4 units, Win (Maharidge)

277. Specialized Workshops—(Same as 177.) One or more classes are offered in specializations such as science or opinion writing, or other areas, and are organized around writing projects oriented toward the field of specialization. Prerequisite: journalism master’s student.

277A. Opinion Writing
   4 units, Win (Woo)

277B. Science Writing

277D. Environmental Reporting

277F. Literary Journalism
   4 units, Spr (Bettiger)

277G. Social Issues Reporting
   4 units, Spr (Maharidge)

277M. Coverage of Medical Technology and Health Care Issues

280. Film Criticism—Graduate section; see 180.
   4 units, Spr (Breitrose)

283. Media Economics—Graduate section: see 183.
   4 units, Spr (Bar)

289. Journalism A.M. Project
   1 unit, Win (Staff)
   3 units, Spr (Staff)

290. A.M. Project
   4 units (Staff)

291. Graduate Journalism Seminar—Required of all students in the graduate program in Journalism. Meets throughout the year as a forum for discussion of current issues in the practice and performance of the press. Journalists in or visiting the Bay Area are guest speakers.
   1 unit, Aut (Glasser)
   Win (Woo)
   Spr (Maharidge)

292A,B,C. Documentary Film and Video A.M. Project Seminar—Focuses on the development, production, and postproduction of A.M. projects, and current issues in documentary film and video.
   6-8 units, Aut (Samuelson)
   Win (Staff)
   Spr (Krawitz)

299. Individual Work
   1-4 units, any quarter (Staff)

PRIMARILY FOR DOCTORAL STUDENTS

301. Communication Curriculum Development and Pedagogy—Required of all second-year Ph.D. students.
   1-3 units, Aut (Nass)

   1-3 units (Staff) not given 2000-01

311. Theory of Communication—Required of all communication doctoral students. Approaches to communication theory, seminar and tutorial meetings, and extensive reading and papers. Prerequisite: Communication Ph.D. student, or consent of instructor.
   4-5 units, Aut (Roberts)

317. Doctoral Research Methods I—Prerequisite: Ph.D. admission in Communication.
   4 units, Aut (Iyengar)

318. Doctoral Research Methods II—Prerequisite: 317.
   4 units, Win (Nass)

319. Doctoral Research Methods III—Prerequisite: 318.
   3-4 units, Spr (Leets)

330G. Seminar in Language and Interpersonal Communication—Limited to Ph.D. students. Advanced topics in language and interpersonal communication. Prerequisite: 230.
   1-3 units (Leets) not given 2000-01

331G. Seminar in Communication/Media Ethics—Limited to Ph.D. students. Advanced topics in press ethics and responsibility. Prerequisite: 231 or consent of instructor.
   1-3 units, Win (Glasser)

333G. Seminar in Communication and Culture—Limited to Ph.D. students. Advanced topics in communication and culture. Prerequisite: 233 or consent of instructor.
   3-4 units (Glasser) not given 2000-01

355G. Seminar in Intergroup Communication—Limited to Ph.D. students. Advanced topics in intergroup communication. Prerequisite: 255 or consent of instructor.
   1-3 units (Leets) not given 2000-01

360G. Seminar in Political Communication—Limited to Ph.D. students. Advanced topics in political communication. Prerequisite: 260 or consent of instructor.
   1-3 units, Win (Iyengar)

369G. Seminar in Communication, Technology, and Society—Limited to Ph.D. students. Advanced topics in communication, technology, and society. Prerequisite: 269 or consent of instructor.
   1-3 units (Nass) not given 2000-01
370G. Seminar in Communication and Children—Limited to Ph.D. students. Advanced topics in communication and children. Prerequisite: 270 or consent of instructor.
1-3 units, Spr (Roberts)

372G. Seminar in Psychological Processing—Limited to Ph.D. students. Advanced topics in psychological processing. Prerequisite: 272 or consent of instructor.
1-3 units, Spr (Reeves)

374G. Seminar in Structure and Control of Communication—Limited to Ph.D. students. Advanced topics in the structure and control of communication. Prerequisite: 273 or consent of instructor.
1-3 units (Glasser) not given 2000-01

3 units (Staff) not given 2000-01

379. Communication: History and Evolution of the Field—The history and current status of the field of communication research. Prerequisite: 273 or consent of instructor.
3-4 units (Staff) not given 2000-01

380A,B,C,D. Curriculum Practical Training—Practical experience in the communication industries. Prerequisites: graduate standing in Communication, consent of instructor.
1-3 units, Aut, Win, Spr, Sum (Staff)

3-6 units, Aut, Win, Spr (Staff)

398. Predissertation Research Project—Advanced research for Ph.D. candidates.
3-6 units, Aut, Win, Spr (Staff)

399. Advanced Individual Work
1-8 units, Aut, Win, Spr (Staff)

400. Dissertation Research
6-10 units, Aut, Win, Spr (Staff)

AFFILIATED DEPARTMENT OFFERINGS
See individual department offerings for course descriptions of the following, all of which are accepted for credit toward the Communication major.

SLAVIC LANGUAGES AND LITERATURES
133A/233A. Deviating from Dogmas: Film in East Europe from 1956 to 1968
4 units, Spr (Bulgakowa)

OVERSEAS STUDIES
FLORENCE
52. Realism, Utopia, Myth, and Society in Italian Cinema—Bernardo Bertolucci, Pier Paolo Pasolini, and Federico Fellini
5 units, Win (Campiani)

COMPARATIVE LITERATURE
Emeriti: (Professors) Joseph Frank, John Freccero, René Girard; (Courtesy Professors) W. B. Carnochan, Gerald Gillespie, Marjorie G. Perloff
Chair: to be announced
Director of Admissions: to be announced
Director of Graduate Studies: to be announced

Director of Undergraduate Studies to be announced

Professors: John Bender (English, Comparative Literature), Russell Berman (German Studies, Comparative Literature), Roland Greene (English, Comparative Literature), Hans U. Gumbrecht (French and Italian, Spanish and Portuguese, Comparative Literature), Seth Lerer (English, Comparative Literature; on leave 2000-01), Herbert Lindenberger (English, Comparative Literature; on leave Autumn), Valentin Mudimbe (French and Italian, Comparative Literature), Patricia Parker (English, Comparative Literature), Mary Louise Pratt (Spanish and Portuguese, Comparative Literature; on leave 2000-01), Richard Rorty (Comparative Literature), Ramon Saidívar (English, Comparative Literature; on leave Spring), Jeffrey Schapp (French and Italian, Comparative Literature)

Associate Professors: Monika Greenleaf (Slavic Languages and Literatures, Comparative Literature), Thomas Hare (Asian Languages, Comparative Literature), Elisabeth Mudimbe-Boy (French and Italian, Comparative Literature), Andrea Nightingale (Classics, Comparative Literature; on leave 2000-01), David Palumbo-Liu (Comparative Literature), Haun Saussy (Asian Languages, Comparative Literature; on leave 2000-01)

Consulting Professors: David G. Halliburton, John Wang
Visiting Professor: Timothy Hampton

The interdisciplinary program in Comparative Literature (CL) admits students for the Ph.D. It works toward the Ph.D. in individual language departments and, in conjunction with the Humanities honors program, offers a concentration in comparative literature for undergraduates.

UNDERGRADUATE PROGRAM
BACHELOR OF ARTS

The undergraduate major in Comparative Literature is designed for students who combine the drive and ability to master foreign languages with a strong commitment to literary study. In all cases, students must do a substantial portion of their work in at least one foreign language. The major enables these students to pursue carefully constructed programs involving the in-depth study of literature in one or more languages not their own; and the study of their literature of specialization, its theory, and its practice in relation to other literatures, communications media, and disciplines.

The major is distinguished from those in the national literatures by its comparative scope, by the requirement of seminars that focus on fundamental theoretical questions regarding the nature of literature and literary inquiry, and by its requirement that the students’ programs of study be structured around the exploration of a single literary genre, historical epoch, or theoretical problem. It differs from the “interdisciplinary” majors in English, and Modern Thought and Literature (MTL) by its requirement that every student’s program be anchored in the study of a literature other than that of his or her native language and, with specific regard to MTL, by its chronological scope.

The “comparative” aspect of each student’s program of specialization is fulfilled according to which of the two available tracks he or she elects to follow:

Track A: The Literary Studies track integrates in-depth work in a primary literature with extensive work in a second literature (in the original language) and complementary course work in an outside field.

Track B: The Interdisciplinary track integrates in-depth work in a primary literature with the focused study of literature in relation to other arts (film, music, painting, and so on), intellectual disciplines (anthropology, history, linguistics, philosophy, and so on), or comparative work in area studies.

An honors program is available in Comparative Literature for both of these tracks (see below) that integrates substantial in-depth work in a primary literature with extensive work in a second literature (in the original language) or discipline, but also requires the writing of a senior honors paper.
In both tracks, students work closely with the department’s Director of Undergraduate Studies in designing an individually tailored program of specialization involving two related areas of study. Individual study plans require considerable advance planning and must meet the approval of the Director of Undergraduate Studies.

**Declaring the Major**—As soon as a student knows that he or she would like to declare the Comparative Literature major (and no later than Autumn Quarter of the junior year), he or she should obtain a worksheet for the appropriate track (see below) from the Comparative Literature office. The completed worksheet (with prospective courses for future years) should be handed to the Director of Undergraduate Studies with an updated official transcript and the student’s advising file. The director will sign the worksheet, indicating his or her approval of the feasibility of the proposed program. This worksheet needs to be updated at least once during each academic year.

**Advising**—When a student declares Comparative Literature, he or she may choose to declare the Director of Undergraduate Studies as his or her adviser, since the director approves credit for all course work (including course work abroad). The adviser may also be a member of the core Comparative Literature faculty. If this occurs, the student must meet periodically with the Director of Undergraduate Studies to monitor his/her progress in the major and for all questions regarding the major’s requirements.

**Overseas Campuses and Abroad Programs**—The Department of Comparative Literature encourages time abroad, both for increased proficiency in language and the opportunity for advanced course work. Course work done at campuses other than Stanford’s is counted toward the major at the discretion of the Director of Undergraduate Studies and is contingent upon the University’s acceptance of classes for units. To that end, students abroad must make an effort to save all notes, papers, correspondence, and so on, to increase the chance of acceptance.

**Honors College**—The Department of Comparative Literature encourages all honors students to enroll in the honors college scheduled during the weeks preceding the beginning of every academic year. Applications to the college are available from the department administrator. The department has traditionally run its honors college in collaboration with Interdisciplinary Studies in Humanities.

### REQUIREMENTS

#### CORE FOR TRACKS A AND B

All majors in Comparative Literature (including honors) are required to complete the following courses, the first as near as possible to the date of declaration and the second during the senior year. Together, these core seminars ensure that majors have been introduced to the framing propositions and principal methods of the discipline. More specifically these courses are designed to lead students to inquire about the historical standing of such concepts as the “literary,” the “aesthetic,” “criticism,” “genre,” “text,” and “theory.”

1. **CL 101, Seminar on Literature and the Institution of Literary Study** (5 units) provides students with an introduction to the comparative study of literature, to the history of poetic theory, and to the historical development of literary fields. It is concerned with addressing foundational questions such as: what kind of knowledge is literary knowledge and how has this knowledge been codified and categorized with respect to other forms of knowledge?

2. **CL 199, Senior Seminar on Literary Theory** (5 units) offers advanced students a program of study focused on one of:
   - a) a single discipline or closely related cluster of disciplines
   - b) the cultural history of a single historical epoch
   - c) one or more of the fine arts; media or film studies
   - d) area studies

This course work must be shaped around the literature courses selected in item 1. It must either treat cognate analytical or thematic issues in the chosen discipline, or be directly relevant to the chosen historical specialization. Students who choose option ‘2d’ must select courses that include work outside a single area studies focus or that have a genuinely comparative aspect. Each of these six courses must be approved in advance by the Director of Undergraduate Studies.
3. One course, usually in translation, on a literature distant from the two of the student’s concentration. The intention here is, as above, to offer an “outside” perspective on the student’s field of specialization.

4. Students in this track must also write at least one seminar paper that is interdisciplinary in nature. This paper should bring together material from courses taken in their primary literature and in another discipline and may be an honors paper (see below), an individual research paper (developed through independent work with a faculty member in CL 198), or a paper integrating materials developed for two separate courses by arrangement with the two instructors. Though it may draw on previous course work, the paper must be an original composition; general guidelines for length require 18–20 pages. It must be submitted to the Director of Undergraduate Studies and receive his or her approval no later than the end of Winter Quarter in the fourth year of study.

Students who choose the interdisciplinary option should be aware that it requires careful advance planning given that many course offerings are offered in alternate years.

**Note**—It is worth emphasizing that, as even a cursory review of the Stanford Bulletin demonstrates, this track in no way overlaps with current offerings in the modern language and literature departments whose majors neither require nor encourage students to pursue an integrated program of interdisciplinary study in tandem with their specialization in a national literature field. What it provides is an opportunity which is elsewhere unavailable to Stanford undergraduates: namely, a major analogous to the “English with an Interdisciplinary Emphasis” track in the Department of English, yet grounded in the study of non-English literature(s) and offering broad training in literary theory.

### MINORS

The undergraduate minor in Comparative Literature (CL) represents an abbreviated version of the major. In all cases, students must do a substantial portion of their work in at least one foreign language.

All minors in Comparative Literature are required to complete CL 101, Seminar on Literature and the Institution of Literary Study (5 units). This provides an essential introduction to the framing propositions and principal methods of the discipline.

In addition, all minors must complete two courses in the literature of a language other than their native tongue. All materials in each course must be in the original language.

1. **Literary Studies Track**: Integrates in-depth work in a primary literature with work in a second literature. Requirements are:
   a) Two courses in a second literature (this may include courses in translation, as well as courses in English and/or American literature).
   b) One additional course in Comparative Literature numbered 0-100

2. **Interdisciplinary Track**: Integrates in-depth work in the primary literature with the focused study of literature in relation to another art or intellectual discipline. Requirements are:
   a) Two courses in a single discipline, or the cultural history of a single historical epoch.
   b) One additional course in Comparative Literature numbered 0-100.

   The minor is modeled primarily on the structure and progression of the major (with the appropriate reduction in course and unit requirements, as stipulated by the Committee of Undergraduate Studies). It retains the distinction between the two CL tracks and enables students to design a course of study built around the core CL seminar.

   The Director of Undergraduate Studies is responsible for evaluating all requests and individual study plans for the minor.

### HONORS PROGRAM

The honors option is reserved for exceptionally motivated students who wish to undertake an even more intensive and extensive program of study leading to the writing of a senior honors paper. The program allows for either a “Literary Studies” or an “Interdisciplinary” emphasis and it requires:

1. Six courses, using materials in the original language and making up an intellectually coherent program, in the literature of language A. For the interdisciplinary emphasis, these courses must be in the literature of a language other than the student’s native tongue.

2. **Emphasis**:  
   a) **For a Literary Studies Emphasis**: three courses using materials in the original language, in the literature of language B.
      
      Note: Track A’s rules regarding students’ native languages, bilingualism, and special exemptions for students studying Chinese, Japanese, Russian, and so on, also govern students in the honors program who opt for a Literary Studies emphasis. These course selections must be coordinated with the courses selected in the literature of language A in order that, taken together, they form a cohesive program of study focused on one of the following:  
      1) a specific literary genre  
      2) an historical epoch  
      3) a theoretical question and three cognate courses that supplement a student’s work in the two chosen literatures and lending it further intellectual shape. One course from the CL 100 series (but not 101 or 199) may be counted under this rubric.
   b) **For an Interdisciplinary Emphasis**: six courses as outlined in the general requirements for the Interdisciplinary Track (Track B), above. This course work must be shaped around the literature courses selected in item 1. It must either treat cognate analytic or thematic issues in the chosen discipline, or be directly relevant to the chosen historical specialization. Students who choose area studies for their interdisciplinary work must complete courses that work outside a single area studies focus or that have a genuinely comparative aspect. Each of these six courses must be approved in advance by the Director of Undergraduate Studies.

3. One further course is required, usually in translation, on a literature distant from the two of the student’s concentrations, so as to provide an “outside” perspective on the student’s area of specialization.

4. **During Spring Quarter of the junior year**, a letter requesting admission to the honors program must be submitted to the department’s Director of Undergraduate Studies. This letter must be accompanied by:
   a) The completed, signed worksheet
   b) An updated transcript
   c) A sample seminar paper
   d) An intended plan of study for the senior year (drawn up according to the emphasis selected)
   e) A preliminary statement (two to five pages) regarding the proposed topic of the honors paper (elaborated in consultation with the Director of Undergraduate Studies)

   (In Spring Quarter of the junior year, the student may enroll for 2 units of credit for independent research in CL 194.)

   This application is voted on by the Comparative Literature honors committee, made up of the Director of Undergraduate Studies and the Chair of the Department of Comparative Literature. Should it be approved, a faculty tutor is appointed by the director according to the topic. At the appropriate time, a second reader is designated by the honors committee.

5. **Once the request for admission to the honors track has been approved**, the student may choose to enroll in a 5-unit tutorial (CL 195, graded credit/no credit) with a faculty member during Autumn Quarter of the senior year in order to refine the project description, begin all necessary research, and initiate the composition of the honors paper.

6. **During Winter Quarter of the senior year**, the student must enroll in a 5-unit independent study (CL 195) with his or her faculty tutor for purposes of drafting the honors paper. At the end of the quarter, a completed draft must be submitted to the tutor. If it meets his or her approval as is, two copies must then be forwarded to the honors committee which will decide on the basis of the paper’s quality whether or not the student is awarded honors. If the faculty tutor feels that the
paper still requires rewriting at the end of Winter Quarter, the student may enroll for 2 units of independent study during Spring Quarter for purposes of final submission. In order to be considered for honors in Comparative Literature, two copies of the final paper must be submitted to the honors committee no later than the fifth week of Spring Quarter.

Honors papers vary considerably in length as a function of their topic, historical scope, and methodology. They may make use of previous work developed in seminars and courses, but must be of appropriate comparative or theoretical scope and should reflect the student’s chosen emphasis. Quality (not quantity) is the key criterion. As a rule of thumb, however, they run in the range of 40-70 pages.

**Honors Awards**—The two readers of any honors thesis in Comparative Literature may elect to nominate the thesis in question for University-wide awards if they feel that it is deserving. In addition, the department honors committee evaluates on a competitive basis the honors theses completed in a given year and nominates one for University-wide awards competitions.

**GRADUATE PROGRAM**

**DOCTOR OF PHILOSOPHY**

University requirements for the Ph.D. are described in the “Graduate Degrees” section of this bulletin.

The Ph.D. program is designed for a small group of students whose linguistic background, breadth of interest in literature, and curiosity about the problems of literary scholarship and theory (including the relation of literature to other disciplines) make this program more appropriate to their needs than the Ph.D. in one of the individual literatures. Students take courses in at least three literatures (one may be that of the native language), to be studied in the original. The program is designed to encourage familiarity with the major approaches to literary study prevailing today.

Before starting graduate work at Stanford, students should have completed an undergraduate program with a strong background in one literature and some work in a second literature studied in the original language. Since the program demands an advanced knowledge of two non-native languages and a reading knowledge of a third non-native language, students should at the time of application have an advanced enough knowledge of one of the three to take graduate-level courses in that language when they enter the program. They should be making enough progress in the study of a second language to enable them to make graduate courses in that language not later than the beginning of the second year, and earlier if possible. Applicants are expected to take an intensive course in the third language before entrance.

A considerable part of a student’s work consists of individual study toward the oral examinations, for which each student devises reading lists in consultation with the graduate adviser. These examinations are centered on the study of particular periods, genres, and problems of literary study.

Students are admitted under a fellowship plan which attempts to integrate financial support and completion of residence requirements with their training as prospective university teachers. Tenure as a fellow, assuming satisfactory academic progress, is for a maximum of four years, graduate-level work in literature completed elsewhere being counted as part of this four-year period. The minimum teaching requirement is the same regardless of financial support. (For specific teaching requirements, see below.) Although financial support is limited to four years, the completion of requirements often requires five years. Students in the fifth year ordinarily apply for outside fellowships or for part-time teaching positions in language and literature departments at Stanford.

**APPLICATION PROCEDURES**

Competition for entrance into the program is keen. The program is kept small so that students have as much opportunity as possible to work in individual projects under faculty supervision throughout the period of study. No more than 16 students are in residence at any one time. The department does not plan to admit more than three or four new students for the class entering in September. Completed applications are due January 1. Because of the special nature of comparative literature studies, the statement of purpose included in the application for admission should contain the following information besides the general plan for graduate work called for on the application:

1. A detailed description of the applicant’s present degree of proficiency in each of the languages studied, indicating the languages in which the applicant is prepared to do graduate work at present and outlining plans to meet additional language requirements of the program.

2. A description of the applicant’s area of interest (for instance, theoretical problems, genres, periods) within literary study and the reasons for finding comparative literature more suitable to his or her needs than the study of a single literature. Applicants should also indicate what they think will be their primary field.

All applicants should arrange to have the results of the general section of the Graduate Record Examination sent to the Department of Comparative Literature.

Recommendations should, if possible, come from faculty in at least two of the literatures in which the student proposes to work.

Applicants must submit a copy of an undergraduate term paper which they consider representative of their best work.

**DEGREE REQUIREMENTS**

**Residence**—A candidate for the Ph.D. degree must complete three years (nine quarters) of full-time work, or the equivalent, in graduate study beyond the A.B. degree. The student is expected to offer at least 72 units of graduate work in addition to the doctoral dissertation. At least three consecutive quarters of course work must be taken at Stanford.

**Languages**—Students must know three non-native languages, two of them sufficiently to qualify for graduate courses in these languages and the third sufficiently to demonstrate the ability to read a major author in this language. Only the third language may be certified by examination. The other two are certified by graduate-level course work specified below. Language preparation must be sufficient to support graduate-level course work in at least one language during the first year and in the second language during the second year. Students must demonstrate a reading knowledge of the third non-native language no later than the beginning of the third year.

Literatures made up of works written in the same language (such as Spanish and Latin American) are counted as one. One of the student’s three literatures usually is designated as the primary field, the other two as secondary fields, although some students may offer two literatures at the “primary level” (six or more graduate courses).

**Teaching**—Fellows, whatever their sources of financial support, are ordinarily required to undertake a total of five quarters of supervised apprenticeships and teaching at half time. Fellows must complete whatever pedagogy courses are required by the departments in which they teach. The department’s minimum teaching requirement is a total of three quarters.

**Minimum Course Requirements**—Students are advised that the range and depth of preparation necessary to support quality work on the dissertation, as well as demands in the present professional marketplace for coverage of both traditional and interdisciplinary areas of knowledge, render these requirements as bare minimum.

1. CL 369E.
2. A sufficient number of courses (six or more) in the student’s primary field to assure knowledge of the basic works in one national literature from its beginnings until the present.
3. At least two additional complementary courses, with most of the reading in the original, in each of two different national literatures. Students whose primary field is a non-native language are required to take two courses in one additional literature not their own.

Minimum course requirements must be completed before the student is scheduled to take the University oral examination. These requirements are kept to a minimum so that students have sufficient opportunity to seek out new areas of interest. A “course” is an offering of 3-5 units. Independent study may take the place of up to two of the required courses, but no
more; classroom work with faculty and other students is central to the program.

Examinations—Three examinations are required. The third and last is the University oral examination. Students' reading lists for each examination must be approved by an examination committee and by the graduate adviser. The examinations consist of the following, each of which takes the form of an oral colloquium between the student and a committee of faculty members with interests in the subject areas:

1. First One-Hour Examination: on a literary genre to consist of (a) a knowledge of a substantial number of literary works in a single genre, the list to include works from a number of centuries and from at least three national literatures, and (b) a grasp of the theoretical problems involved in dealing with this genre and with the question of genre in general. The examination must be taken no later than the beginning of the student's second year of graduate work (or the third quarter of the first year for students who enter with a year of previous graduate work).

2. Second One-Hour Examination: on literary criticism and theory, to consist of the exploration of a specific problem proposed and defined by the student. The problem must be sufficiently wide-ranging to demand the reading of critical texts from a variety of periods. The examination must be taken no later than the first quarter of the student's third year of graduate work (or the third quarter of the second year for students who enter with a year of graduate work). Students may elect to take this section of the examination before the genre section, in which case it must be taken at the earlier time.

3. University Oral Examination: on a literary period, to consist of in-depth knowledge of a period of approximately a century, in three or more literatures with primary emphasis on a single national literature or, in occasional cases, two national literatures. The reading list covers chiefly the major literary texts of this period but may also include some studies of intellectual backgrounds and modern critical discussions of the period. Students must demonstrate a grasp of how to discuss and define this period as well as the concept of periods in general. This examination is not to be on the dissertation topic, on a single genre, or on current criticism, but rather on a multiplicity of texts from the period. Students whose course work combines an ancient with a modern literature have the option of dividing the period sections into two wholly separate periods.

Qualifying Procedures—The qualification procedures for students in Comparative Literature take place during the quarter in which the student takes the first Ph.D. examination. Ordinarily, this is the beginning of the second year, but students who enter with a year of graduate work elsewhere must take the examination no later than the third quarter of the first year. Any student may elect to take the examination during the third quarter of the first year.

Students are judged qualified to proceed to the Ph.D. on the basis of the first part of Ph.D. examination as well as other aspects of their work (for example, performance in courses, ability to do original research) that predict strong promise for their dissertations and future careers as scholars and critics. As soon as the student has completed the qualifying procedures, the chair recommends him or her for admission to candidacy for the Ph.D. At this time the student is also recommended for the Master of Arts degree in Comparative Literature if he or she has completed 36 units of work at Stanford and has not already completed an A.M. before entering the program.

Colloquium—The colloquium normally takes place in the quarter following the University oral examination. The colloquium lasts one hour, begins with a brief introduction to the dissertation prospectus by the student lasting no more than five minutes, and consists of a discussion of the prospectus by the student and the three readers of the dissertation. At the end of the hour, the faculty readers vote on the outcome of the colloquium. If the outcome is favorable (by majority vote), the student is free to proceed with work on the dissertation. If the proposal is found to be unsatisfactory (by majority vote), the dissertation readers may ask the student to revise and resubmit the dissertation prospectus and to schedule a second colloquium.

The prospectus must be prepared in close consultation with the dissertation adviser during the months preceding the colloquium. It must be submitted in its final form to the readers no later than one week before the colloquium. A prospectus should not exceed ten double spaced pages, in addition to which it should include a working bibliography of primary and secondary sources. It should offer a synthetic overview of the dissertation, describe its methodology and the project's relation to prior scholarship on the topic, and lay out a complete chapter by chapter plan.

It is the student's responsibility to schedule the colloquium no later than the first half of the quarter after that quarter in which the student passed the University Oral Examination. The student should arrange the date and time in consultation with the department administrator and with the three examiners. The department administrator schedules an appropriate room for the colloquium.

Members of the dissertation reading committee ordinarily are drawn from the University oral examination committee, but need not be the same.

Ph.D. MINOR

This minor is designed for students working toward the Ph.D. in the various foreign language departments. Students working toward the Ph.D. in English are directed to the program in English and Comparative Literature described among the Department of English offerings. Students must have:

1. A knowledge of at least two foreign languages, one of them sufficient to qualify for graduate-level courses in that language, the second sufficient to read a major author in the original language.

2. A minimum of six graduate courses, of which three must be in the department of the second literature and three in the Department of Comparative Literature, the latter to include a seminar in literary theory or criticism. At least two of the three courses in comparative literature should originate in a department other than the one in which the student is completing the degree. Except for students in the Asian languages, students must choose a second literature outside the department of their major literature.

COURSES

Courses meeting Writing in the Major requirements are indicated by (WIM).

CORE

These courses are aimed at freshmen and sophomores who are non-majors (and/or potential majors) and provide an entry point to the discipline of Comparative Literature.

All majors are required, as soon as possible after declaration, to successfully complete CL 101. During the senior year, majors enroll in 199.

20N. Stanford Introductory Seminar: Worlds (No Longer) Apart—Preference to freshmen. For those interested in reading literature and viewing films to make sense of historical and contemporary worlds. Literary narratives, films, documentaries, and videos examine the new textures of modern life, characterized by movements of people across nations, and a globe shrinking under new global politics, economies, and telecommunications. New forms of identity reflect the cultural changes of such movements. The narratives of Chinua Achebe, Junichiro Tanizaki, Amitav Ghosh, and Gabriel Garcia Marquez (with films and documents). The impact of re-drawn borders and immigration in the U.S. in works by Maxine Kingston, David Hwang, Bienvenido Santos, and Americo Paredes. Films from the Philippines and India, television in Kathmandu with Pico Iyer.

3 units (Palumbo-Liu) not given 2000-01

22N. Stanford Introductory Seminar: Shakespeare and Performance—Preference to freshmen. The problem of "performance" (including the "performance of gender") through the plays of Shakespeare. In-class performances of scenes from plays by students, consideration of the history of theatrical performance, the critical viewing of filmed versions of particular plays, and readings on the history of gender,
“gender performance,” and transvestite theater. Possible plays: A Midsummer Night’s Dream, The Taming of the Shrew, As You Like It, All’s Well that Ends Well, Hamlet, Othello, The Comedy of Errors, Much Ado About Nothing, Antony and Cleopatra, Henry V, The Merchant of Venice, Twelfth Night, The Winter’s Tale. GER:3a,4c (DR:7)†
3 units, Spr (Parker)

24Q. Stanford Introductory Seminar: Ethnicity and Literature—Preference to sophomores. What is meant by “ethnic literature?” Answers to that question propose a sense of the constituent terms developed, i.e., what is literature? How do such notions of literature enter into a particular dynamic when “what is ethnicity” is asked? How is “ethnic writing” different from “non-ethnic” writing, or is there such a thing as either? If “ethnicity” is accepted as an analytic perspective, how does it affect the way literature is read by ethnic peoples? Articles and works of fiction; films on the subject of ethnic literature and cultural politics. Goal: to understand better how ethnic literature represents the nexus of crucial social, historical, political, and personal issues. GER:3a,4b (DR:3 or 7)†
3-5 units, Aut (Palumbo-Liu)

34N. Stanford Introductory Seminar: Other Spaces, Other People—(Same as French and Italian 34N.) Preference to freshmen. How “Otherness” and the “elsewhere” have been represented in human imagination and how individual imagery is influenced by collective representations. Focus is on lost worlds (Atlantis), mythical worlds (underground), invented worlds (Utopia), and the foreigner and stereotypes. The motives of travel, home, and displacement, and their psychological and ideological significance: mourning for lost worlds, search for happiness, desire for deterritorialization or self-fulfillment. Visual material. Readings in theory, literature, and travel accounts. Authors: Plato, Marco Polo, More, Baudelaire, Calvin, Kristeva, Todorov, Dadié, and others. GER:3a (DR:7)
3-5 units, Win (Boyi)

70N. Stanford Introductory Seminar: The Bible and World Culture—Preference to freshmen. The Bible is to many a little-known text, though it has been the foundation of major literary texts and political movements, art, and music. Its most influential portions are read from Genesis through Apocalypse, and are considered in relation to, e.g., literary excerpts, music from Handel to reggae, anti-slavery and liberationist narratives, and the major speeches of Martin Luther King. 3 units (Parker) not given 2000-01

80N. Stanford Introductory Seminar: The Science Wars—Does Physics get Closer to Reality than Poetry?—Preference to freshmen. Do the truths of natural science correspond to the intrinsic nature of reality? Does reality have an intrinsic nature, or does it just have lots of different descriptions? Is scientific progress toward those truths real? Does postmodernist relativism rot the mind and undermine the foundations of civilization? The answers introduce students to the study of philosophy. Readings: E. O. Wilson, Consilience; A. J. Ayer, Language, Truth, and Logic; Hilary Putnam, Reason, Truth, and History; T. S. Kuhn, The Structure of Scientific Revolutions. 5 units (Rorty) not given 2000-01

84Q. Stanford Introductory Seminar: Shakespeare, Playing, Gender—Preference to sophomores. Focus is on several of the best and lesser-known plays of Shakespeare and on theatrical and other kinds of “playing” (the “purpose of playing”—Hamlet), and on ambiguities, and of gender and “playing gender” in particular. Topics: transvestism inside and outside of the theater, medical and other discussions of sex changes from female to male, hermaphroditism, and fascination with the “monstrous” more generally. Possible plays: The Taming of the Shrew, The Merry Wives of Windsor, Twelfth Night, As You Like It, A Midsummer Night’s Dream, Hamlet, Othello, The Tempest, Pericles, Antony and Cleopatra, and The Merchant of Venice. GER:4c (DR:7)†
3 units, Win (Parker)

85C. Asian American Youth: Culture and Identity—Survey of the issues that affect Asian American youth in contemporary society. Focus is on higher education, hip hop, sexuality, mixed race descent, interracial dating, religion, and politics as they shape youth identity and culture. Final project.
2 units, Aut (Palumbo-Liu, Staff)

101. Seminar on Literature and the Institution of Literary Study—Introduction to the comparative study of literature and to the history and practice of literary interpretation. Students write short papers to develop their own interpretive skills. (WIM)
5 units, Win (Lindenberger)

113. Seminar: Voice and Literature in Russia and America 1776-1917—Introduction to the comparative study of literature through voice and text. In the modern era, prose and poetry have drawn from the productive tension between the vital but ephemeral spoken word and the objectification of language in writing. The shifting relationship between these modes of expression and the changing representations of voice in text have defined forms of social and cultural identity (gender, race, class, nation), and the notion of literature itself. Concepts from theoretical readings are explored in active dialogue with literary texts from several national traditions and genres. 5 units (Greenleaf) not given 2000-01

115Q. Stanford Introductory Seminar: Thinking in the Present—Discussions about 20th-Century European Philosophy—Preference to sophomores. More than the Anglo-American (“analytic”) tradition which dominates in this country’s philosophy departments, European (“continental”) 20th-century philosophy has made the effort of thinking its/our own present with its existential, social, political consequences. The continental tradition has taken greater risks and probably accepted, in exchange, a lesser degree of rigor in its style of argumentation. Readings/discussion of several analyses of “present situations,” written (in different moments and from different angles) by continental philosophers: Helene Cixous, Jacques Derrida, Martin Heidegger, Niklas Luhmann, Jean-Francois Lyotard, and Gianni Vattimo. Texts deal with questions regarding the continued viability (or non-viability) of concepts and patterns of thought in Western cultural and intellectual life (e.g., Subjectivity, Reason, Knowledge, History).
3 units, Aut (Gumbrecht)

126. 20th-Century American Fictions—(Same as English 126.)
5 units, Win (Saldivar)

194. Independent Research
1-5 units, Aut, Win, Spr (Staff)

195A,R,C. Honors—195A and B should total 10 units between the two quarters. 195B and C must be the same grade.
195A. Honors Research
0-10 units, Aut (Staff)
195B. Honors Thesis
0-10 units, Win (Staff)
195C. Honors Thesis
2 units, Spr (Staff)

199. Senior Seminar on Literary Theory—For senior Comparative Literature majors (others by application). An introduction to structuralist, post-structuralist, psychoanalytic, and marxist thinking about language, literature, and culture. Theoretical readings are supplemented with selections from the literary texts. Readings in English translation. GER:3a (DR:7)‡
5 units, Aut (Bender)

UNDERGRADUATE/GRADUATE

103/203. Egyptian East/Egyptian West—The texts and visual arts of ancient Egypt reveal a persistent and sophisticated engagement with
problems of language, the body, and multiplicity. These problems are related to the later understanding of Egypt's position vis-a-vis subsequent civilizations in "the West." Focus is on the written and visual representational systems used in the ancient Nile Valley, on Egyptian mythology as it represents gender difference, and on the ways the Egyptians constructed their relations with the divine, the metaphysical, and the eternal.

GER:4a (DR:2)
3 units, Spr (Hare)

3-4 units (Greenleaf) not given 2000-01

156D/256D. Nabokov and Modernism—(Same as Slavic Languages and Literatures 156/256.) Stories, novels, and film scripts in the context of other modernist writers (Bergson, Proust, Joyce), media (photography and film), and 20th-century events and intellectual discourses (Marxism-Stalinism, avant-garde, Freudianism, American postwar cultural ideology), whose influences Nabokov belittled or ignored. Critical approaches that elude the author's control. Readings: Despair, Camera Obscura, The Gift, Bend Sinister, Lolita, Pale Fire, excerpts of Eugene Onegin's Commentary and Speak Memory.

3-4 units, Spr (Greenleaf)

161/261. Poetess: The Grammar of the Sex when the Poet is a Woman—(Same as Slavic Languages and Literatures 161/261.) Seminar. Readings of lyrical works by women poets from the U.S., Russia, Eastern Europe, and Germany (Dickinson, Moore, Brooks and the Harlem Renaissance, Bishop, Akhmatova, Tsveetaeva, Sachs, Plath, Cisneros, Angelou, Graham, Howe, and Szymborska.) The historical and cultural context enriches our understanding of such theoretical and practical issues as "breaking and entering" the male preserve of "high poetry" in different eras; the interaction of written and oral, political, and performative modes of expression; new representations of the feminine body and experience in the visual arts; and the development of a female lineage and modes of poetic legitimation, association, and inspiration.

4 units, Win (Greenleaf)

168. Introduction to Asian American Culture—Asian American cultural production (film, drama, poetry, fiction, music) in sociohistorical context, with attention to the topics of ethnicity, race, class and gender, and the political economy of ethnic culture in the U.S. GER:3a,4b (DR:3 or 7)
5 units, Win (Palumbo-Liu)

171. Comparative Narrations of Race, Ethnicity, and Nation—How can we get a better sense of issues of race and ethnicity by comparing the construction of these notions in the U.S. to their appearance (or invisibility) in another country? The historical and contemporary constructions of race and ethnicity in France and the U.S., the histories of colonization and decolonization, global labor and economies, immigration and redrawn borders, have all demanded different modes of incorporating diverse populations into variously reformulated notions of the nation. Use of films; music; literary texts; with historical, anthropological, sociological materials.

3-5 units (Palumbo-Liu) not given 2000-01

172. From Religion through Philosophy to Literature—Introduction to non-analytic philosophy. The attempts by philosophers (Plato, Kant, and Hegel) to replace religion with philosophy, of criticisms of such attempts by Nietzsche and Kierkegaard, and of Heidegger's attempt to end philosophy and to substitute something more like poetry. GER:3a (DR:7 or 8)
5 units, Win (Rorty)

180/280. The 19th-Century Novel—The paradigmatic texts of the 19th-century novel: Scott (Waverley) and Stendhal (The Charterhouse of Parma), Flaubert (The Sentimental Education), Dickens (Great Expectations), Zola to Conrad (Heart of Darkness) to Mann (Buddenbrooks). The aim is to track the development of "realism" over the course of the "century of progress." GER:3a (DR:7)
5 units, Win (White)

202. Comparative Ethnic Autobiography—How ethnic literary texts have provided the occasion for the production of particular kinds of "selves," and how these productions might disclose the varied possibilities of racialized "self fashioning." The material is comparative in terms of the inter-racial cultural and social histories witnessed in the narrative texts and our own sense of location and identity. Who are these texts written to and how does the issue of audience shift our understanding of the possible significances of the text? How does historical moment contribute to the shape of these narratives and our understandings of race, gender, and ethnicity? What are the relations between aesthetics and ideology? What might the gaps be between the desired effect of the text and its actual realization in the minds of disparate audiences? The category of "autobiography" includes autobiographical fiction and essays. GER:4b (DR:3)
5 units, Spr (Palumbo-Liu)

210. Women Writers of Early Modern Europe—The female literary experience in Early Modern France, and Spain. Close readings of, e.g., Marguerite de Navarre, Maria de Zayas, and Madame de Lafayette. Topics: marriage and the convent; virgins and widows; gossip; court culture. Additional readings from Boccaccio, Rabelais, etc., with representative critical readings from Foucault, Lacan, Butler, Mignolo, etc. Required readings available in English; students are encouraged to read in the original.

4-5 units, Spr (Middlebrook)

212. The History of Rhetoric—The history of the discipline of rhetoric from Classical Greek and Latin traditions, through medieval, Renaissance, modern, and contemporary treatments. Schemes and tropes (Cicero and Quintilian); grammatical education and the schools (Geoffrey Vinsauf, John of Garland); Renaissance handbooks (Wilson, Puttenham); 18th- and 19th-century oratory; current appropriations (e.g., Paul de Man, deconstruction). Texts are read for their deployments of rhetorical devices and their thematic attentions to verbal organization (e.g., selections from the Aeneid, medieval lyrics, Chaucer's Canterbury Tales, Shakespeare's Hamlet, Augustan and Romantic poetry, 19th-century prose fiction). Modern English translations; some emphasis to original-language texts of earlier periods.

4-5 units (Lever) not given 2000-01

220. Versions of the Self—Studies of the genre of autobiography in cross-cultural perspective, concentrating on the topics of "the self, the subject, and the other" in myth, religion, history, and literature in the 20th century. How have the "extreme" situations of 20th-century life (atomic warfare, population displacement, concentration camps, changes in the conditions of work, plagues, and ecological disasters) led to the dismantling of traditional (religious and humanistic) notions of selfhood and the effort to redefine the nature of human subjectivity? Readings of Western, Asian, Latin American, and Middle Eastern biography.

5 units (White) not given 2000-01

264E. Seminar: Petrarch and Petrarchism—The Latin and vernacular writings of Francesco Petrarca, and their influence and impact on European cultural history in literature and the arts. Readings from Petrarch's fundamental works (Trionfi, Canzoniere, Africa, Secretum, Epistulae, etc.), and authors such as Garcilaso, Gongora, Sydney, Spenser, and Ronsard. Readings available in English translation.

5 units (Schnapp) not given 2000-01

268. Introduction to Dream of the Red Chamber—A study of the Chinese novel Hong lou meng (ca. 1750) by Cao Xueqin and Gao E,
together with its major commentaries. Methods of Euro-American criticism are tested against this seductive and challenging work. Readings in English translation.

4 units (Saussure) not given 2000-01

5 units (Palumbo-Liu) not given 2000-01

4-5 units, Win (Bender, Lenoir, Taylor)

300. The Theory of the Text—Studies in the theory of textuality, textualism, discourse, and interpretation. Issues connected with narrative and narrativity; the structure of tales, stories, and myths; the modernist rejection of narrativity; and narrative as a cognitive mode.

Theorists: Lukacs, Propp, Greimas, Barthes, Genette, Girard, Jameson, etc.

5 units, Win (White)

300B. Colloquium: The Bible and Literature—Combines intensive readings from Genesis to Revelation, with selections from literary texts (Dante and medieval drama through Shakespeare, Spenser, Renaissance lyric, and Milton; 19th- and 20th-century poetry and novels from British, American, African-American, African, etc.). Related topics: the relation between biblical eschatology and literary strategies, Song of Songs and the history of lyric, the influence on prototypes of race/gender difference, citations in radical and hegemonic political contexts.

4-5 units (Parker) not given 2000-01

301C. Nations and Cosmopolitanisms—The origins of modern comparative literary study may be traced to an engagement with the idea of distinct nations and national cultures, and the modern articulation of cosmopolitan culture. The various facets and formations of this engagement, including historical studies which point to the construction of “literature” as a modern object, and recent work on nations and national identity (culture wars, patriotism, post-ethnicity) and new cosmopolitanisms (“rooted cosmopolitanism,” cultural studies in different national and institutional sites, etc.) in which “literature” variously appears and disappears, removed from or reinstituted in its role as “culture.”

5 units (Palumbo-Liu) not given 2000-01

308C. Seminar: Introduction to Literary Criticism and Theory—Introduction to literary theory and criticism from New Criticism through Structuralism, post-Structuralism, archetypal; and psychoanalytical criticism to post-Modernist textualism.

5 units (White) not given 2000-01

310E. Lyric Economies in the European Renaissance—(Same as French and Italian 310E.) Courtly lyric in Early Modern Europe, from the troubadours to the age of Shakespeare. Topics: patronage, print culture, English and Continental relationships, exploration and empire. Writers: Petrarch, Ronsard, Du Bellay, Shakespeare, Sidney, Garcilaso and Sor Juana. Critical and theoretical readings from Marx, Bourdieu, Adorno, etc.

4-5 units, Spr (Hampton)

5 units (White) not given 2000-01

314. Epic and Empire—(Same as English 314.) Focusing on Virgil’s Aeneid and its influence, traces the European epic tradition (Ariosto, Tasso, Camoens, Spenser, and Milton) to New World discovery and mercantile expansion in the early modern period.

5 units, Spr (Parker)

316E. “New Lacanian” Politics—(Same as French and Italian 316E.)

5 units, Aut (MacCannell)

317E. Crowds—(Same as French and Italian 317E.)

5 units, Spr (Schnapp)

325. Politics and Culture—The ways in which culture has been read next to and in the political, with specific reference to history. Readings of Lukacs, Adorno, Benjamin, Gramsci, Leavis, Williams, CLR James, Howe, Bell, and recent works by Moi, Gilroy, Anzaldua, Mulloz, Jameson.

5 units, Spr (Palumbo-Liu)

359E. Seminar: Writing and Cookery—Towards a Literary Anthropology of Food—Graduate research tracks the literal and figurative overlap between the realms of writing and food. Plato’s dialogues, which linked cookery to Sophistry; and Roman satire (a genre rooted in a culinary analogy and beyond). The role of food preparation, presentation, and consumption in a literary-anthropological light. Topics: Petronius’s Banquet of Trimalchio; Goliardic song, devilry, and cookery in Dante’s Inferno; food in Rabelais and “Macaronic” literature (Folengo); Brillat-Savarin’s La Physiognomie du Gout; Nietzsche’s notions of diet; and Marinetti’s Futurist Cookbook. Secondary readings: Levi Strauss, Bynum, Elias, Dettene, and Vernant. Enrollment limited to 12.

5 units (Schnapp) not given 2000-01

359F. Seminar: Transnational Poetics—(Same as English 359.)

4-5 units, Aut (Saldivar)

360. Non-Representational Theories of Language and Thought—The works of Wittgenstein, Davidson, and Derrida, with some reference to Locke, Saussure, Brandom, and others.

5 units (Rorty) not given 2000-01

361C. Graduate Colloquium: The Modern Tradition—Globalization and Modernity—Rather than assume one modern tradition, the colloquium encourages the analysis of the (uneven) appearance of a number of possible “modernities” in various geopolitical spaces, their cultural and historical formations, and their inter-relations. Can modernity be seen as a uniquely “western” achievement? By examining such diverse topics as trade and migration, nationalism and postcolonialism, the complicated history of modernity is understood as a global phenomenon. Prerequisite: consent of instructor.

5 units, Aut (Palumbo-Liu)

366. Seminar: Literary Theory—Structuralism and After—Introduction to the theorists whose ideas shaped the study of literature and culture over the past generation. The entry point is recent works by Butler, Guillory, Spivak, Zizek, etc. Selections from prior theorists focus on issues of present concern: Saussure, Jakobson, Volosinov, Levi-Strauss, Lacan, Althusser, Austin, Foucault, Derrida, Bourdieu, Kristeva.

4-5 units (Bender) not given 2000-01

369E. The Disciplines of Literature—(Same as French and Italian 369E.) Open to all entering graduate students in the Division of Literatures, Cultures, and Languages. Introduction to the history, structure, and intellectual debates of the disciplines of literary study. The origins of comparative and national literatures in the study of philology and the institutions of the European university. Key theoretical moves that
shaped literary theory, criticism, and history in America: semiotics and structuralism, deconstruction, and post-structuralist critiques; the renewed interest in the rhetoric and rhetorical reading, identity politics, and ethnic studies; views of the literary canon and the impact of cultural studies.

3 units, Aut (Gumbrecht, Schnapp)

370. The Anthropology of Speed—A dialogue between the history of technology and cultural history (art, music, literature, film). Seminar examines the formative impact of themes of speed, acceleration, and intensification on modern notions of experience, subjectivity, signification, power, and production. Topics: 18th-century coaching and the rise of amateur coaching; the rise of sporting and racing subcultures and sporting media during the early 19th century; psycho-physical theories of thrill and shock; exercise and hygiene from the fin de siècle to the present; scientific management and the world of work; bodies and machines; cognitive and perceptual ramifications of aviation, mechanized ground transportation, film, and video; velocity, addiction, entertainment, and ennui. Authors: De Quincey, Marinetti, Virilio, Ballard.

not given 2000-01

4-5 units (Parker) not given 2000-01

372. Literary Theory and the Necessary Fiction of Asia—The role of effective multiculturalism (fantasy, misunderstanding, exaggeration, projection, and minor effects) in the domain of theories about literature and culture. The enabling role of a hypothetical "other" culture. The resulting lessons as integrated into our practice as students of Asia. Readings from Hegel, Nietzsche, Segalen, Pound, Husserl, Corbin, Heidegger, Foucault, Derrida, de Man, Geertz, Said, Kristeva, Clifford, etc.

4 units (Saussy) not given 2000-01

389. Seminar: Regimes of Inscription—Memory, Writing, and Printing—Since the 18th century, theories about oral composition and transmission have perturbed the order of literary studies (including the hermeneutics of sacred texts). During the last 50 years, an awareness of the historical and technological specificity of print, concurrently with the growth of electronic media, has led to a questioning of the understanding of writing, text, and reading basic to textual interpretation. These questions are examined as they arise in various local contexts, seeking to displace alphabetic writing as the norm of inscription. Readings from Homer, Sappho, Aristotle, Mencius, Vico, Lowth, Janet, Jousse, Parry, Luria, McLuhan, Derrida, Zumthor, Goody, etc.

4 units (Saussy) not given 2000-01

395. Research

1-15 units, any quarter (Staff)

395A,B,C. Philosophical Reading Group—Close reading of classical and contemporary texts from the Western philosophical tradition.

2-3 units, Aut (Gumbrecht)

399. Dissertation

1-15 units, any quarter (Staff)

RELATED OFFERINGS

Courses primarily of a comparative nature are listed below and require enrollment in the departments they are listed under.

ASIAN LANGUAGES AND LITERATURES

92. Traditional East Asian Civilization: Japan

5 units, Win (Hare)
GERMAN STUDIES
132. 19th-Century Literature and Culture: Romanticism
   4 units, Aut (Eshel)
133. 20th-Century Literature and Culture: Modernism
   4 units, Win (Kenkel)
161N. Stanford Introductory Seminar: The Arthurian Legend in Literature and Film
   3-5 units, Spr (Poor)
163A. Kafka
   3-5 units, Spr (Berman)
241A-243A.
   241A. Deutsche Geistesgeschichte I: 18th-Century German Thought
      3-5 units, Aut (Mueller-Vollmer)
   242A. Deutsche Geistesgeschichte II: 19th-Century German Thought
      3-5 units, Win (Pan)
   243A. Deutsche Geistesgeschichte III: 20th-Century German Thought
      3-5 units, Spr (Poor)
279. Naturalism
   4 units, Win (Kenkel)

LANGUAGE CENTER
125A,C,D,E. Topics in Arabic Literature and Culture—Designed to be taken independently. Readings/discussion in English.
   125A. The Contemporary Arabic World and Culture through Literature
      4 units, Aut (Barhoum)
   125C. Contemporary Arab Women Writers and Issues
      4 units (Barhoum) not given 2000-01
   125D. Arab World through Travel Literature
      4 units, Spr (Barhoum)
   125E. Short Stories and Poetry from the Arab World
      4 units, Win (Barhoum)

SLAVIC LANGUAGES AND LITERATURES
133A/233A. Deviating from Dogmas: Film in East Europe from 1956 to 1968
   4 units, Spr (Bulgakowa)
145/245. The Age of Experiment (1820-1850)
   3-4 units, Aut (Greenleaf)
146/246. The Age of Transgression: Russian Literature from Turgenev through Tolstoy
   4 units, Win (Safran)
147/247. The Age of Revolution: Russian Literature and Culture since 1917
   3-4 units, Spr (Freidin)
151. Dostoevsky and His Times
   4 units, Win (Frank)
152/252. Russian Modernist Theater: Naturalism, Expressionism, Symbolism, and Futurism
   4 units, Win (Bulgakowa)
154/254. History of Russian Theater
   4 units, Aut (Bulgakowa)

163. Beyond Fiddler on the Roof: The Jewish Experience in Eastern Europe through Literature and Film
   4 units, Aut (Safran)
272A. Osip Mandelstam and the Modernist Paradigm
   4 units, Win (Freidin)

SPANISH AND PORTUGUESE
253E. The Modern Imagination and Mexico’s Ancient Books
   3-5 units, Aut (Brotherston)

307. Latin American Cultural Theory: A Historical Perspective
   3-5 units, Aut (Sd)
313. The Colonial Condition
   3-5 units, Spr (Gomez)
327. Literary and Cultural Theories
   3-5 units, Aut (Rios)
328. Nation(s) and Citizenship(s): Modernity, Postmodernity, and Globalization
   3-5 units, Aut (Rios)

344E. Decolonizing the Middle Ages
   3-5 units, Spr (Dagenais)

OVERSEAS STUDIES
These courses are approved for the Comparative Literature major and taught overseas at the campus indicated. Students should discuss with their major advisers which courses would best meet individual needs. Descriptions are in the "Overseas Studies" section of this bulletin, or at the Overseas Studies Office, 126 Sweet Hall.

MULTI-SITE COURSE
91. Literary Institutions: A Comparative Approach
   4 units, Win (Berman)

OXFORD
140X. The Condition of Postmodernity: England in the Postcolonial Era
   units to be announced, Spr (Saldivar)

150X. Gardens of Earthly Delight: The Cultural Politics of English
   units to be announced, Spr (Saldivar)

PARIS
110P. French Anthropology
   units to be announced, Win (Saussy)
120P. Baudelaire: A Poet in the City
   units to be announced, Win (Saussy)

COMPARATIVE STUDIES IN RACE AND ETHNICITY (CSRE)

Director: Albert Camarillo
Steering Committee: Albert Camarillo, Gordon Chang, George Fredrickson, Hazel Markus, John Rickford, C. Matthew Snipp, Dorothy Steele
Students who declare any of the five majors participate in a common curriculum of the CSRE consisting of at least two introductory "core" courses and a senior seminar. Individually designed majors in Jewish Studies may also enroll in the CSRE core curriculum.

MINORS

Students who wish to minor in the study areas must complete six courses (a minimum of 30 units) from the approved CSRE course list, two of which must be introductory "core" courses. Proposals for the minor must be approved by the chair of each study area.

DIRECTED READING AND RESEARCH

Directed reading and research allows students to focus on a special topic of interest. In organizing a reading research plan, the student consults with the chair of the major and one or more faculty members specializing in the area or discipline.

SENIOR SEMINAR

Research and the writing of the senior honors thesis or senior paper is under the supervision of a faculty project adviser. The seminar is offered in Autumn Quarter, and discussions take students through the process of research (conceptualization, development of prospectus, development of thesis, research, analysis, and writing). This course meets the writing in the major requirement (WIM). Those who opt to write senior papers are organized into tutorial groups in Autumn Quarter.

RELATED PROGRAMS

CSRE-related majors have several unique opportunities available to them. The program supports full-time paid summer internships for those who apply to work in a non-profit or government agency in a public policy-related area. The CSRE Public Policy/Leadership Institute is a two-week, pre-Autumn Quarter seminar that provides exposure to critical public policy issues and is taught by a leading faculty member. The residence-based institute provides room and board and all seminar materials for participants, including a visit to Sacramento to meet with policymakers. Those who apply to the Stanford in Washington program in Spring Quarter have the opportunity to enroll in a CSRE-sponsored seminar, Race and Ethnicity and American Public Policies. The CSRE program also sponsors quarterly career workshops and informal luncheons for all majors and minors.

HONORS

Majors in each of the study areas who meet academic qualifications (at least a grade point average (GPA) of 'B+' in CSRE-related courses) may apply for admission. Majors are expected to participate in a Spring Quarter junior workshop in preparation for their honors thesis research. Prizes for the best undergraduate honors theses are awarded annually by the Curriculum Committee of CSRE.

AFRICAN AND AFRICAN AMERICAN STUDIES (AAAS)

Chair: John Rickford

Since 1997-98, AAAS has been a CSRE-related major. For major and minor descriptions and requirements, see the “African and African American Studies” section of this bulletin.

ASIAN AMERICAN STUDIES

Chair: Gordon Chang

Asian American Studies (AAS) provides an interdisciplinary approach to understanding the historical and current experiences of persons of Asian ancestry in the United States. In using the term "Asian American," the AAS faculty recognize that the term seeks to name a rapidly developing, complex, and heterogeneous population and that there is neither a single Asian American identity nor one "community" that comprises all Asian Americans. Asian Americans include those with ancestral ties to countries or regions in East Asia, South Asia, Southeast Asia, or the Philippines, among others.
AAS brings together courses that address the artistic, historical, humanistic, political, and social dimensions of Asian Americans and is an appropriate course of study for students interested in a variety of concerns related to Asian Americans, including: artistic and cultural contributions, current social significance, historical experiences, immigration, intellectual, policy issues, relationships with other social groups, and the construction of "Asian American" as it addresses important theoretical and practical issues.

**REQUIREMENTS**

AAS offers undergraduate opportunities for either a major or a minor. In addition to the 15 units in the CSRE core curriculum, 45 units are distributed as follows: 5 units in a course with an international dimension; 30 units in Asian American focus courses selected from among historical studies, social sciences, and humanities; and 10 units in courses offering comparative perspectives. In certain instances, students are able to apply credit from the study of an Asian language to help meet requirements and receive a special citation for relevant language study. For students already fluent in an Asian language, the citation may also be earned to apply credit from the study of an Asian language to help meet requirements.

Students interested in the major or minor in AAS with a faculty adviser to develop a specific program of study. The proposal must be approved by the Chair of AAS. Policies and programming for the major and minor are guided by the Asian American Studies Curriculum Committee.

**CHICANA/O STUDIES**

*Chair: Guadalupe Valdés*

Chicana/o Studies is an interdisciplinary major focusing on the Mexican-origin population of the U.S., the second largest ethnic group in the nation. Students who major or minor in Chicana/o Studies have an opportunity to select from a wide variety of courses in the humanities and social sciences as well as selected courses offered by affiliated faculty in the School of Education. In addition to the CSRE introductory "core" courses, students who major and minor in Chicana/o Studies are required to enroll in the Introduction to Chicana/o Cultural Studies.

**REQUIREMENTS**

Together with their faculty mentors, majors design a thematic concentration consisting of eight courses (40 units). The substantial number of courses available across the disciplines permit majors to develop unique and innovative thematic concentrations. Students also have opportunities to participate in public service-learning internships related to their academic course of study. The Chair of Chicana/o Studies Curriculum Committee approves applications for majors and minors and reviews proposals for the honors program. The major is guided by a curriculum committee.

A "Spanish Language Proficiency Option" is offered to majors interested in using Spanish in their course work or for their research. This option, modeled on programs of foreign language study across the curriculum at other institutions, is aimed at students who have a strong interest in using the Spanish language proficiency they have acquired in meaningful contexts outside of foreign language courses. There are several ways to complete the Spanish Language Proficiency Option. Consult with the Chair of Chicana/o Studies for details about these options.

Students who wish to minor in Chicana/o Studies must enroll in two CSRE introductory "core" courses and the Introduction to Chicana/o Cultural Studies course. The remaining three courses must be designed around a general theme or topic.

**COMPARATIVE STUDIES IN RACE AND ETHNICITY**

*Chair: Albert Camarillo*

The major and minor in Comparative Studies in Race and Ethnicity (CSRE) offer students one of the most unique opportunities in higher education: to study the topics of race and ethnicity from comparative national and international perspectives. How to manage and to understand ethnic differences and conflicts has long been a central issue in international affairs, especially since the end of the Cold War, and an intense debate has developed in the United States on how to achieve justice and equality in an ethnically diverse, multicultural society. The themes of both interethnic cooperation and conflict are critical for comprehending the history and current social reality of racial and ethnic groups world-wide.

Students have an opportunity to structure a major or minor through CSRE that encourages the study of these and other important issues facing the U.S. and other societies.

**REQUIREMENTS**

Students who major in CSRE enroll in the core curriculum, and in consultation with the chair of the program and a faculty mentor, develop a thematic course of study focusing on the comparative dimensions of race and ethnicity. Though majors and minors in CSRE must complete the CSRE core introductory courses before they focus their work on the thematic concentration, students have great flexibility to structure and design their comparative curriculum. For example, students may opt to develop a concentration comparing two or more groups within the U.S. or they may choose to study groups in the U.S. in comparison to ethnic groups elsewhere in the world. Or, they may opt to study the diaspora of a single group or the sovereignty of indigenous peoples within and across different national contexts. In different examples of thematic concentrations for the CSRE major, students may prefer to study issues of international migration or how social constructions of racial identities are influenced by gender or class.

The thematic course of study developed by CSRE majors must be approved by the CSRE chair. Proposals for the minor and admission to the CSRE honors program must be approved by the chair. The policies and programs for the major and minor are guided by the Curriculum Committee of the CSRE Faculty Steering Committee.

**PROGRAM IN JEWISH STUDIES**

*Chair: Steven Zipperstein*

Jewish Studies is an affiliated program of CSRE. For program and course descriptions see the "Jewish Studies" section of this bulletin.

**NATIVE AMERICAN STUDIES**

*Chair: C. Matthew Snipp*

Native American Studies provides an intensive approach to understanding the historical and contemporary experiences of Native American people. Attention is paid not only to the special relationship between tribes and the Federal government, but to issues across national boundaries, including tribal nations within Canada, and North, Central, and South America. In using the term "Native American," the NAS faculty recognize the heterogeneous nature of this population. Native Americans include the Alaska Native population, which comprises Aleuts, Eskimo, and other Native American people residing in Alaska.

The purpose of the Native American Studies major and minor is to introduce students to a broad range of approaches in the academic study of Native American people, history, and culture. Students who major in Native American Studies have the opportunity of doing advanced work in a number of related fields, including literature, sociology, education, and law. In addition to specialized course work on Native American issues, students also are expected to concentrate in a traditional discipline such as anthropology, history, or psychology to ensure they have a well rounded educational experience. The area of concentration and related course work should be selected in consultation with a faculty adviser in Native American Studies. All courses in the program in some way promote the ongoing discussion of how academic knowledge about Native Americans relates to the historical and contemporary experiences of Native American people and communities.

**REQUIREMENTS**

NAS offers undergraduates opportunities for either a major or minor. The major requires 60 units of course work. In addition to the 15 units of CSRE core courses, 45 units are distributed as follows: 30 units in Na-
live-American focus courses selected from among humanities and social sciences; 5 units in a course devoted to the methodologies, theories, or field research in a particular area of study; and 10 units in courses offering comparative perspectives. Students may acquire credit from a service-learning internship option. Minors take 30 units in a program of study similar in form to that of majors. A proposal for the major must be approved by the chair.

**COURSES**

**CORE**

**COMPARATIVE LITERATURE**

202. Comparative Ethnic Autobiography  
5 units, Spr (Palumbo-Liu)

**COMPARATIVE STUDIES IN RACE AND ETHNICITY**

200XYZ. Senior Seminar—(200X fulfills WIM.)  
units by arrangement, Aut, Win, Spr (Chang)

**CULTURAL AND SOCIAL ANTHROPOLOGY**

88. Theories of Race and Ethnicity: A Comparative Perspective  
5 units, Win (Yanagisako)

**EDUCATION**

156X. Understanding Racial and Ethnic Identity  
5 units (LaFromboise) not given 2000-01

**HISTORY**

65. Introduction to Comparative Studies in Race and Ethnicity  
5 units, Spr (Camarilla, Staff)

257. Undergraduate Colloquium: Immigrants and Racial Minorities in American Cities—Comparative Perspectives  
5 units (Carson) not given 2000-01

**PHILOSOPHY**

177. Philosophical Issues Concerning Race and Racism  
4 units, Spr (Satz)

**THEMATIC**

**AFRICAN AND AFRICAN AMERICAN STUDIES**

105. Introduction to African and African American Studies  
5 units, Spr (McCants)

106A,B,C. African and African American Studies Lecture Series  
1-3 units, Aut (Rickford)  
Win (Jackson)  
Spr (McCants)

107. African and African American Studies Learning Expedition  
1 unit, Spr (Staff)

**ANTHROPOLOGICAL SCIENCES**

8. Introduction to Anthropological Genetics  
5 units, Win (Mountain)

**ASIAN AMERICAN STUDIES**

181. Readings in other Literatures of Asian America  
5 units, Spr (Pelaud)

**COMMUNICATION**

122B. Documentary Film  
5 units, Win (Krawitz)

155. Interethnic Communication  
5 units, Spr (Leets)

**COMPARATIVE STUDIES IN RACE AND ETHNICITY**

203. Race and Education: Strategies for Change in the 21st Century  
5 units, Spr (Montoya, Steyer)

204. Israel/Palestine: Literature, Politics, and Identity—(Same as Jewish Studies 204.)  
5 units, Win (Alcalay)

**COMPARATIVE LITERATURE**

88C. Asian American Youth: Culture and Identity  
2 units, Aut (Palumbo-Liu, Staff)

168. Introduction to Asian American Culture  
5 units, Win (Palumbo-Liu)

171. Comparative Narrations of Race, Ethnicity, and Nation  
3-5 units (Palumbo-Liu) not given 2000-01

**CULTURAL AND SOCIAL ANTHROPOLOGY**

72. Dance and Culture in Latin America—(Same as Drama 168.)  
3-4 units, Spr (Cashion)

77. Japanese Society and Culture  
5 units, Aut (Inoue)

83A. Korean American Diaspora  
5 units, Aut (Lee)

85. Trials of the 20th Century: Technology, Law, and Culture  
5 units, Aut (Jain)

87. Social Change in Contemporary China: Remaking the Middle Kingdom  
5 units, Win (Kohrman)

87A. Human Rights: Anthropological Perspectives  
5 units, Spr (Davis)

88A. Race and Ethnicity in Mexico  
5 units, Spr (Vaughn)

132. Science, Technology, and Gender  
5 units, Win (Jain)

153B. Millennialism in the American Imaginary: From Columbus to the Present  
5 units (Delaney) not given 2000-01

250A. Gender, Race, and Colonialism: On the Politics of Knowledge  
5 units, Aut (Stoler)

**DRAMA**

113. Group Communication  
4 units, Win, Spr (Schrader)

163. Performance and America  
5 units, Aut (Elam)

**DANCE**

42. Dances of Latin America  
1 unit, Aut (Cashion)

43. Afro-Brazilian and Afro-Peruvian Dance  
1 unit, Aut (Cashion)

75. Mexican Dance and Folklore  
2 units, Win (Cashion)

150A. African-American History to the 20th Century
5 units, Aut (M. Thompson)

150B. Introduction to African-American History: The Modern Black Freedom Struggle
5 units, Spr (Carson)

159. Introduction to Asian American History
4-5 units, Spr (Chang)

167C. Introduction to Feminist Studies—(Same as Feminist Studies 101.)
5-6 units, Win (Freedman)

187. Palestine, Zionism, and the Arab-Israeli Conflict
5 units (Beinin) not given 2000-01

187B. The Middle East in the 20th Century
5 units, Win (Beinin)

188C. Jews in the Modern World
5 units, Aut (Zipperstein)

248S. Undergraduate Research Seminar: Colonial States and Societies in Africa
5 units, Win, Spr (R. Roberts)

250. Undergraduate Colloquium: American Popular Culture
5 units, Win (M. Thompson)

251A,B. Undergraduate Colloquium: Poverty and Homelessness in America
8 units (Camarillo) not given 2000-01

253. Undergraduate Colloquium: Topics in African American History—The Great Migration
5 units (M. Thompson) not given 2000-01

255. Undergraduate Colloquium: The History of Multiraciality in America
5 units, Aut (Pang)

255A. Undergraduate Colloquium: Culture and Ideologies of Race
5 units, Aut (M. Thompson)

256. Undergraduate Colloquium: Topics in Mexican American History
5 units (Camarillo) not given 2000-01

259. Undergraduate Colloquium: Race and Ethnicity in the United States and South Africa
5 units (Fredrickson) not given 2000-01

265. Undergraduate Colloquium: New Research in Asian American History
5 units (Chang) not given 2000-01

270S. Undergraduate Research Seminar: North American Wests
5 units, Spr (White)

288. Undergraduate Colloquium: Palestine and the Arab-Israeli Conflict
5 units, Aut (Beinin)

HUMAN BIOLOGY

141. Race, Poverty, and the Environment
5 units (Rosencranz) not given 2000-01

LINGUISTICS

73. African American Vernacular English
3-5 units (Rickford) alternate years, given 2001-02

150. Language in Society
4-5 units, Spr (Eckert)

159. Language and Youth Culture
5 units, Win (Heath)

251. Pidgin and Creole Sociolinguistics
4 units, Aut (Rickford)

MUSIC

3 units, Aut (Sano)

111. Perspectives in North American Taiko
4 units, Spr (Sano, Uyechi)

NATIVE AMERICAN STUDIES

101. Introduction to Native American Studies
5 units (Simms)

103. Native American Women
5 units (Bomberry)

106. Native American Literature
5 units (Bomberry)

116. Language, Culture, and Education in Native North America
5 units (Nelson-Barber)

POLITICAL SCIENCE

25. Colonialism and Nationalism in the Third World
5 units (Abernethy) given 2001-02

104. Seminar: Urban Policy
5 units, Aut (Fraga)

117K. The Global Politics of Human Rights
5 units, Win (Karl)

118B. The Politics of Race and Class in Southern Africa
5 units, Aut (Abernethy)

OVERSEAS STUDIES

These courses are approved for the CSRE major and taught overseas at the campus indicated. Students should discuss with their major advisors which courses would best meet individual needs. Descriptions are in the "Overseas Studies" section of this bulletin or at the Overseas Studies office, 126 Sweet Hall.

PUEBLA

104X. Cholula: The Workings of a Sacred City
3 units, Win (Knab)

CULTURAL AND SOCIAL ANTHROPOLOGY

Chair: Sylvia Yanagisako
Professors: Ian Hodder, Renato I. Rosaldo, Sylvia J. Yanagisako
Associate Professors: Carol L. Delaney, Akhil Gupta
Assistant Professors: Paulla Ebron, Miyako Inoue, Sarah S. Jain, Matthew Kohrman, Purmina Mankekar
Courtesy Professors: Penelope Eckert, Raymond McDermott
Lecturers: Sandra Lee, Christopher Matthews
Visiting Professors: Gustavo Politis, Ann Stoler, Izaly I. Zemtsovska
Visiting Assistant Professor: Tristan Carter
Affiliated Faculty: Susan Cashion, James A. Fox, Shirley Brice Heath, Barbara Koenig, Hazel R. Markus, Thomas P. Rohnen, Michael Shanks
Teaching Fellows: Kristin Bright, Amy Burce, Keila Diehl
Acting Instructors: Robin Balliger, Sameer Pandya, Adam Yue Chau
Teaching Affiliates: John Davis, Monica DeHart de Galicia, Aradhana Sharma, Bobby Vaughn

*Recalled to active duty.

The courses offered by this department are designed to: (1) provide undergraduates with instruction in cultural and social anthropology; (2) provide undergraduate majors in anthropology with a program of work leading to the bachelor's degree; and (3) prepare candidates for advanced degrees in cultural and social anthropology.

Cultural and social anthropology addresses a wide range of issues in the comparative study of society and culture. These include issues of race, class, national origin, gender, sexual orientation, and religion as they are shaped by the experiences of education, history, and migration through which people in past and contemporary societies have defined themselves in relation to others. The scope of cultural and social anthropology includes our own society and culture as well as those of other parts of the world, especially as these are drawn together and shape one another in increasingly transnational and global interactions.

The Department of Cultural and Social Anthropology offers a wide range of approaches to the various subfields and topics within anthropology including: archaeology, environmental anthropology, linguistics, medical anthropology, political economy, science and technology studies, and sociocultural anthropology. Methodologies for the study of micro- and macro-social processes are taught through the use of qualitative and quantitative approaches. Training is offered in ethnographic research; the collection and interpretation of oral histories, surveys, and archival materials; the analysis of material culture, including mapping, cataloging, and interpretation of material objects; and methodologies in the performative arts, including visual and performing studies. The department provides students with excellent training in theory and methods to enable them to pursue graduate study in any of the above-mentioned subfields of anthropology. Students interested in the biological and evolutionary approaches to anthropology are urged to consult the Department of Anthropological Sciences.

Note—The degree programs of the Department of Cultural and Social Anthropology became available in Autumn Quarter of 1999-2000. Students who declared their major in Anthropology in 1998-99 or in any previous year have the option of finishing their degrees under the guidelines and requirements of the former Department of Anthropology (see, for example, Stanford Bulletin 1998-99) or they may opt for the new guidelines and requirements outlined here. The choice of these options should be made in writing, with the faculty adviser's approval, and filed with the Cultural and Social Anthropology Student Program Coordinator.

UNDERGRADUATE PROGRAMS

BACHELOR OF ARTS

The Department of Cultural and Social Anthropology (CASA) offers an A.B. degree in Cultural and Social Anthropology and an honors program. The major provides students with expertise for understanding social and cultural transformations from an international and cross-cultural perspective. In addition to gaining an excellent foundation for graduate research and study, students majoring in Cultural and Social Anthropology can pursue careers in government, international business, international development agencies, international education, law, mass media, non-profit organizations, and public policy.

Within the major, students may include course offerings in other departments such as Anthropological Sciences, Classics, Economics, English, History, Political Science, Psychology, and Sociology, as well as course offerings in programs such as African Studies, American Studies, Comparative Studies in Race and Ethnicity, East Asian Studies, Feminist Studies, Latin American Studies, Public Policy, and Urban Studies.

To declare a major in Cultural and Social Anthropology, students should contact the department's Student Peer Adviser or Student Program Coordinator. Both of these individuals can provide an application form (see below for deadline) and answer initial questions.

All undergraduate majors in Cultural and Social Anthropology must fulfill the following requirements:

1. A program of 65 units, with at least 40 units in Cultural and Social Anthropology. The remaining 25 units may be taken from courses in related departments, including Anthropological Sciences, or transferred from other anthropological study programs, such as overseas programs. The 65 units must form a coherent program of study and be approved by the student's academic adviser.

2. A grade of 'B-' or better in CASA 90. This course is required of all CASA majors and should be taken within a year of declaring the major or before the end of the junior year. It introduces students to anthropological theory and prepares them for upper-division courses in the department.

3. The units required for the CASA major must include at least one course in four of the following topical categories:
   a) Linguistic and Symbolic Anthropology (for example, CASA 7N; related courses that could be used include Anthropological Sciences 115, or Linguistics 73, 150, 159)
   b) Race and Ethnicity (for example, CASA 88, 88A, 150C)
   c) Feminist Anthropology (for example, CASA 132, 160)
   d) Globalization and Transnationalism (for example, CASA 83A, 87A, 133A,B,C, 134A)
   e) Science, Technology, or Medicine (for example, CASA 82, 85)
   f) Material Culture (for example, CASA 137, 138A, 174)

4. Students must choose a concentration, taking at least 15 units in three or more courses on one theme or topic. Concentrations can be defined by subject matter or cultural area. Some examples of themes for a
concentration are: cultural studies, economic development, kinship, mass media, material culture, migration and immigration, political economy, popular culture, race and ethnicity, religion, urban cultures, or a particular culture area, that is, Japan, Europe, Southeast Asia. Students must have areas of concentration approved by their advisers.

5. A minimum of 15 units must be in CASA seminars numbered 100 or above.

6. Competence in a foreign language beyond the first-year level. Such competence is usually demonstrated by completing a course at the second-year level with a grade of "B-" or better. The requirement may be met by special examination administered through the Language Center.

7. All CASA majors are encouraged to write a senior paper, based on library research or field research. Honors is by application only.

Up to 10 units of the CASA Area 1 track (Introduction to the Humanities 27A, B) may be counted toward the major. Students whose programs require non-English language study as part of a geographical or linguistics focus may ask their CASA adviser to approve up to 10 units of language courses toward the degree if such courses are at the second-year level and above, or are in a second non-English language. No more than 10 units of directed individual study may be counted toward the major, and may only be included among the 25 "related units" permitted for the major. All required units for undergraduate programs must be passed with a grade of 'C' or better, and not more than 10 (maximum of 5 units in CASA and 5 units in related subjects) of the required 65 units may be taken for a "satisfactory/no credit" grade.

Majors are strongly encouraged to develop field research projects. Research course work includes 95A, Postfield Research Seminar; and 96, Directed Individual Study. The department has summer field research grants available to support individually designed research projects.

It would be helpful for students to meet the chair of the Undergraduate Committee and/or the Undergraduate Peer Adviser for initial advice on choosing an appropriate faculty adviser in the department. In consultation with their faculty advisers, students must develop a coherent program of study for the major. Students are required to submit the application form for the major, including their completed proposed plan of study, to the Student Program Coordinator no later than the beginning of the Winter Quarter of the junior year.

Majors are required to meet with their advisers at least once every quarter. Each student’s progress towards fulfilling the major requirements is recorded in a file kept in the Student Program Coordinator’s office. It is the student’s responsibility to see that this file is kept up to date.

MINORS

In addition to electronically declaring on Axess, prospective Cultural and Social Anthropology minors need to meet with the department’s Student Program Coordinator in order to receive and fill out a Minor Planning Form and Checklist.

Requirements for the minor are:

1. Have a faculty adviser in Cultural and Social Anthropology (assistance may be obtained from the department’s Student Program Coordinator).

2. Complete 30 units of Cultural and Social Anthropology courses with a grade point average (GPA) of 'C' or better. Of those 30 units:
   a) A minimum of 15 units must be taken at or above the CASA 70 course level.
   b) A maximum of 5 units may be taken in Directed Individual Study.
   c) A maximum of 5 units may be taken in Independent Research.
   d) Up to 10 units may be transfer credits or taken for instructor-elected satisfactory/no credit grade. No units may be taken for a student-elected satisfactory/no credit grade.
   e) Introduction to Humanities 27A and 27B may be included.

Deadline for Declaring the Minor—Students must complete the declaration process (both Planning Form submission and Axess registration) by the last day of the quarter, two quarters prior to the degree conferral (for example, by the last day of Autumn Quarter if spring graduation is intended).

HONORS

The Honors Program in Cultural and Social Anthropology is open to all majors in the department. Students interested in obtaining honors in CASA should submit to the Student Program Coordinator by the end of the second week of the Winter Quarter of their senior year: (1) an application; (2) a paper; (3) a letter of recommendation from a faculty adviser; and (4) a transcript. The paper submitted could have been written in the Postfield Seminar or any other CASA course. Admission to the honors program requires at least a 3.5 grade point average (GPA) in the major and a 3.0 GPA overall. (In exceptional circumstances, students may request that the GPA requirements be waived by filing a petition with the Undergraduate Committee.) Students who have more than one "Incomplete" at the application due date are not be admitted into the honors program.

Candidates whose application to the honors program is approved by the Undergraduate Committee must complete all requirements for their major and submit an honors thesis no later than four weeks prior to the end of the quarter in which graduation is anticipated. The thesis is read by the candidate’s adviser and a second reader appointed by the Undergraduate Committee. Honors candidates must enroll in 95A (Research in Cultural and Social Anthropology) and 95B (Honors), up to a maximum of 10 units for each. Most honors projects involve a total of 10 to 20 units of coursework in 95A and 95B, no more than 5 of which can count towards the 65-unit degree requirement for the major.

GRADUATE PROGRAMS

University requirements for the degrees of Master of Arts and Doctor of Philosophy are described in the “Graduate Degrees” section of this bulletin.

MASTER OF ARTS

The Department of Cultural and Social Anthropology offers the A.M. degree to four groups of students: (1) Stanford undergraduates who enroll in the coterminous program; (2) Stanford graduate students taking advanced degrees in other departments or schools at Stanford; (3) Ph.D. students in Cultural and Social Anthropology who fulfill the A.M. requirements in the course of their work toward the Ph.D. degree; and (4) students who apply from outside of Stanford for entry into the terminal A.M. program.

Stanford students interested in the coterminous program and graduate students in other departments or schools at Stanford should review the “Graduate Degrees” section of this bulletin and consult with the student program coordinator in the department. Other prospective students should request application materials from Graduate Admissions, the Registrar’s Office. Successful applicants for the A.M. program usually enter Autumn Quarter. Applications from Stanford students are reviewed in Winter Quarter if received by January 1 and in Spring Quarter if received by April 15. Outside applicants must file their scores on the Graduate Record Examination.

Applicants whose ultimate goal is the Ph.D. degree should apply directly to the Ph.D. program. Students accepted for the terminal A.M. degree program cannot transfer to the Ph.D. program; they must reapply on the same basis as other Ph.D. applicants and in competition with other Ph.D. applicants. Ph.D. students who decide to take the A.M. on the way to the Ph.D. are governed by separate requirements described in the department’s Guide to the Ph.D. Program.

Graduate enrollment at Stanford for at least three quarters of full tuition is required of all candidates for the master’s degree, including coterminous students. A.M. students in Cultural and Social Anthropology must take a minimum of 45 quarter units in sociocultural anthropology beyond the undergraduate degree with a grade point average (GPA) of ‘B’ or better. Thirty-six of those units, which constitute the University minimum for the A.M. degree, must be at or above the 100-level, and 18 of the 36 must be in courses designated primarily for graduate students (typically at least at the 200 level). The department further requires at least 15 ad-
diotional units of sociocultural anthropology, taken at Stanford or elsewhere, constituting a minimum total of 60 units in anthropology. At the discretion of the department, the 15 additional units may have been taken in fulfillment of the undergraduate degree. Within the 45 units taken at Stanford, students must take Cultural and Social Anthropology 211, plus two additional grade-level seminars in the department. The remaining units may be made up of courses selected in consultation with the faculty adviser to meet the needs and interests of the student.

The A.M. program usually requires more than one year of study. However, full-time students entering the program with appropriate background can complete the A.M. program in one calendar year. To provide a meaningful A.M. program within a one-year period, advance planning of course work with an adviser is required.

A field or library research paper, read and approved by at least two departmental faculty members, must be presented. Ph.D. students in the department may submit the first-year paper in fulfillment of this requirement. Other A.M. students must submit a project proposal for the master's paper for approval. Coterminal students must obtain approval either by the end of the second quarter of the fifth year of study, or if earlier, by the end of the quarter preceding the quarter in which the degree is completed. All other A.M. students must do so not later than the end of the second quarter of graduate study.

**DOCTOR OF PHILOSOPHY**

Prospective graduate students should request application materials from Graduate Admissions, the Registrar's Office. Applicants must file a report of their scores on the Graduate Record Examination and submit a writing sample in English that demonstrates the ability to produce original analytical work at the graduate level. Successful applicants for the Ph.D. program may enter only in Autumn Quarter. The deadline for applications is January 4.

The Ph.D. program includes a number of required courses and examinations. It also allows the student to develop a flexible program reflecting special interests, under the supervision of a faculty committee chosen by the student. Students are encouraged to plan for completion of all work for the Ph.D. in five years.

The Ph.D. requirements for students who matriculated beginning 1999 are as follows (those matriculating earlier should consult the department's *Guide through the Ph.D. Program* for their cohort).

1. Pass within the first year, with a grade of 'B+' or better:
   a) At least three of the graduate-level courses in department designated by the faculty as theory/evaluation courses, including Cultural and Social Anthropology 210 and 211
   b) Cultural and Social Anthropology 212, Anthropological Research Methods
   c) At least 40 units of completed course work overall
2. In Spring Quarter of the first year, enroll and participate in the teaching apprenticeship practicum (CASA 298C).
3. Submit an acceptable, substantial research paper in the Spring Quarter of the first year.
4. During the second year, pass at a satisfactory level:
   a) Additional graduate-level theory/evaluation courses in the department to make a total of six such courses over the first two years of the program
   b) The Proposal Writing Seminar (CASA 294)
   c) At least 27 units of completed course work overall
5. Serve as a teaching assistant during the second year for three courses (or two courses if not on University financial aid). An approved internship may be substituted for one course of the teaching assistantship requirement.
6. By the end of Winter Quarter in the second year, recruit the special examination committee, and by the end of Spring Quarter in the second year, schedule examinations (see item 9, below).
7. For those whose native language is English, pass, by the end of Spring Quarter of the second year, a reading examination in a language other than English in which there is a substantial body of general theoretical literature relevant to anthropology. For those whose native language is not English, demonstrate satisfactory command of English, as evidenced by successful completion of the first two years of graduate study.
8. Upon completion of the above requirements, and upon recommendation of the Cultural and Social Anthropology faculty, petition for candidacy at the end of Spring Quarter of the second year or Autumn Quarter of the third year.
9. Pass a special examination (written and oral), before or during Winter Quarter (but in no case later than the fourth week of Spring Quarter) of the third year, covering the candidate's major topic of specialization and one major ethnological area of the world. The oral part of this examination is normally taken as the University oral.
10. Serve as a teaching assistant for one course in the third year if on financial aid (waived for those who complete all requirements above no later than Winter Quarter of the third year).
11. Prepare a dissertation proposal to be approved by the student's dissertation committee, and obtain needed research clearances before the end of Spring Quarter of the third year and before undertaking doctoral research.
12. Present an approved dissertation based on independent research.

**Ph.D. MINOR**

Prospective Ph.D. minors in Cultural and Social Anthropology should request an application from the CSA Student Program Coordinator. The requirements for a minor in Cultural and Social Anthropology consist of the following:

1. Complete 30 units of courses in the Department of Cultural and Social Anthropology at Stanford with a grade point average (GPA) of 'B' or better. Course work for a minor cannot also be used to meet requirements for a master's degree.
2. Enlist a faculty member within the Department of Cultural and Social Anthropology at Stanford who will provide written consent to serve as the adviser for the minor (see the Student Program Coordinator for a listing of faculty and office hours).
3. In conjunction with the adviser, determine a coherent course of study related to the Ph.D. program, including Cultural and Social Anthropology 211, two courses in theory, and one course in a geographical area (for a list of current theory/methods courses, see the Student Program Coordinator).
4. File the necessary paperwork with the Student Program Coordinator. Department of Cultural and Social Anthropology requirements listed above are more extensive than the University requirements.

**FINANCIAL SUPPORT**

The department endeavors to provide needed financial support (through fellowships, teaching and research assistantships, and tuition grants) to all students admitted to the Ph.D. program who maintain a satisfactory course of study. Applicants for the Ph.D. program must file a request for financial aid when applying to the program if they wish to be considered for support. First-year students in the Ph.D. program who have not entered with outside funding are required to apply for such funding during their first quarter. No financial support is available to students enrolled for the A.M. degree.

**TEACHING CREDENTIALS**

For information concerning the requirements for teaching credentials, consult the "School of Education" section of this bulletin or address the inquiry to the Credential Administrator, School of Education.

**COURSES**

(WIM) indicates that the course meets the writing in the major requirements.

**UNDERGRADUATE**

**GENERAL**

Open to all students, these courses are introductory in the sense that prior knowledge is not assumed. Students who want a general introduction to human behavior and culture are advised to take CASA 1; those...
who are interested in introductory courses focused on specific areas of anthropological inquiry should choose from among the courses numbered 2 through 18.

1. Cultural and Social Anthropology—(Upper-division students register for 101.) Cross-cultural anthropological perspectives on human behavior, including cultural transmission, social organization, sex and gender, culture change, technology, war, ritual, and related topics. Lectures, films, and readings present case studies illustrating basic principles of the cultural process. Student projects include data-collection, transcription, analysis, and consideration of theoretical implications, and connections to the existing literature. 5 units (Inoue) not given 2000-01

7N. Stanford Introductory Seminar: Investigating Culture—Preference to freshmen. Students compare and contrast their experience of entering the University with that of anthropologists entering another culture. The culturally specific ways that people situate themselves (and are situated) in space and time, by means of language, the structures of everyday life, and the global economy in terms of the body, and the symbols and frameworks provided by public myth and ritual. Classic anthropological readings, supplemented by weekly ethnographic exercises, enable students to become more deeply aware of culture as a constructed phenomenon that is open to investigation of its implicit premises and explicit forms. GER:3b (DR:2 or 9) 4-5 units, Aut (Delaney)

8N. Stanford Introductory Seminar: Narratives of Self and Society—Preference to freshmen. How people portray their lives, the factors that made them become who they are, the nature and impact of encounters with different worlds, and the ways they find meaning in their lives. How external factors, such as globalization, class, race, and migration shape people’s life stories. 5 units (Rosaldo) not given 2000-01

9. From the Age of Exploration to the Present: Latin America, Europe, and the U.S.—GER:1 (DR:1) (two-quarter sequence) 5 units, Win (Collier)

10. From the Age of Exploration to the Present: Europe and the U.S.—GER:1 (DR:1) (two-quarter sequence) 5 units, Spr (Balliger)

11C. Gender in Cross-Cultural Perspective—Anthropological theories of gender constructions. Recent questions posed to anthropologists about representation, power, and the interpretive authority of ethnographers, drawing on a range of resources (ethnography, film, fiction, and life stories). How gender is a lens through which other forms of social organization can be illuminated and how given theoretical tools act as framing devices for the kind of cross-cultural interpretation one makes. 5 units (Ebron) not given 2000-01

12. Introduction to Feminist Study—Understanding the creation and perpetuation of gender inequality. Topics: sexuality, reproduction, work, family, welfare, violence, language, and religion. Examples from non-western societies illuminate the cultural and historical construction of gender in western society. 5 units (Delaney) not given 2000-01

13. Critical Perspectives on Popular Culture—Introduces critical perspectives on popular culture, including Hollywood and Indian film, Latin American and U.S. soap operas, popular music, and video. Emphasis is on the historical, sociological, anthropological, and cultural studies perspectives on popular culture and mass media in cross-cultural contexts. Issues: the relationship between film and nationhood, television sitcoms and racial identity, soap operas and gender, and video and ethnicity. 5 units (Mankekar) not given 2000-01

15. Africa and the Diaspora—Lecture/discussion. Surveys the debates surrounding Africa and the diasporic communities. The cultural history offers insight into contemporary discussions about the culture and politics of these mapped cultural spaces. Methodological approaches set the context, providing basic analytic tools for research projects. GER:4a (DR:2) 5 units (Ebron) not given 2000-01

THEORY AND RESEARCH

90. Theory in Cultural and Social Anthropology—Anthropological interpretations of other societies contain assumptions about ourselves and about "Western" societies. Seminar highlights that interplay and considers how underlying assumptions and implicit categories have influenced the presentation of data in a set of major anthropological monographs. Emphasis is on Karl Marx, Emile Durkheim, Max Weber, and anthropological analyses of nonwestern societies. (WIM) 5 units, Win (Balliger)

93. Prefield Research Seminar—Prepares students for anthropological research in other societies and the U.S. Data collection techniques include participant observation, interviewing, surveys, sampling procedures, life histories, ethnobiography, and the use of documentary materials. Strategies of successful entry into the community, research ethics, interpersonal dynamics, and the reflexive aspects of fieldwork. Prerequisite: introductory course in anthropology or consent of instructor. 5 units, Spr (Davis)

94. Postfield Research Seminar—Undergraduates analyze and write about material gathered during summer fieldwork, emphasizing writing and revising as key steps in analysis and composition. Students critique classmates’ work and revise their own writing in light of others’ comments. Reading/discussion on ethical issues in fieldwork and ethnographic writing, setting research write-up concerns within broader contexts. Objective: produce an excellent ethnographic report based on original field research. 5 units, Aut (Rosaldo)

95A. Research in Cultural and Social Anthropology—Independent research conducted under faculty supervision, normally taken junior or senior year in pursuit of an honors program. May be taken more than one quarter for credit. Prerequisite: approved application to the honors program. 1-10 units, any quarter (Staff)

95B. Honors—Taken in the final quarter of the student’s work for graduation with honors. Independent study and honors thesis work for students admitted to the program. Prerequisites: acceptance to the honors program and a draft of the honors thesis. 1-10 units, any quarter (Staff)

96. Directed Individual Study—For undergraduate students with special needs, and showing the capacity to do independent work. Prerequisite: 1 or consent of instructor. 1-10 units, any quarter (Staff)

99A,B,C/199A,B,C. Honors/Masters Writing Workshop—(Graduate students register for 199.) For students in the process of writing honors’ or master’s papers. Techniques of interpreting data, organizing bibliographic materials, writing, editing, and revising. Preparation of
papers for conferences and publications in anthropology.

2-6 units, Aut, Win, Spr (DeHart de Galicia)

UNDERGRADUATE AND GRADUATE

AREA STUDIES

72. Dance and Culture in Latin America—(Same as Drama 168.)
3-4 units, Spr (Cashion)

73. Introduction to Chicano Life and Culture—Chicano culture in historical perspective, including indigenous and African negatives and comparisons with Mexico and other U.S. Latino groups. Emphasis is on the contemporary period and popular culture.
5 units (Rosaldo) not given 2000-01

5 units, Win (Mancall, Pandya)

76. Political Economy of India—The changing nature of relations of power in the Indian economy since British colonial rule. Conflicting interpretations of Indian economic history, the success of post-Independence development efforts, the relationship between agriculture and industry in contemporary India, and the position of the subcontinent in the world systems. Prerequisite: 120 or History 186.
5 units (Gupta) not given 2000-01

77. Japanese Society and Culture—Critical issues in the contemporary study of Japan. Topics: inequality, gender, ethnic minorities, personality theory, popular culture (animation, rap, music, and other), and the Western imagination of “Japan.” GER:3b,4a (DR:2 or 9)
5 units, Aut (Inoue)

82A. Introduction to Asian American Culture—(Enroll in Comparative Literature 168.)
5 units, Win (Palumbo-Liu)

83. Gender in South Asian Communities at Home and Abroad—The relationship between men and women in S. Asian communities. Gender relations in India, Pakistan, Bangladesh, Sri Lanka, Nepal, and overseas S. Asian communities (e.g., those in N. America, Africa, and the U.K.). Focus is on the relationship between the practices and ideologies of gender, and other social institutions (e.g., religion, family, state, mass media, and ideologies of communalism and nationalism). Prerequisite: 12 or consent of instructor.
5 units (Mankekar) not given 2000-01

83A. Korean American Diaspora—Examines Korean immigration to the U.S. using ethnographic, historical, and literary materials, and films. How are Korean American identities shaped by discourses on race and ethnicity, gender, colonialism, and religion? Employing the perspective of diaspora, examines issues of nation, home, community, and citizenship in the formation of these identities.
5 units, Aut (Lee)

84. The Multicultural City in Europe—European cities have become a kaleidoscope of peoples and cultures. What does multiculturalism mean in the European setting? How have different governments dealt with the issues, and with what results? The theoretical issues of migration, citizenship, and international labor as they affect people’s lives. How does culture affect how different groups utilize space and time, health, and educational resources? How do different notions of gender, family, work, religion, and food and clothing operate as symbols of identity? What are the politics of language? In what way does the city foster or mitigate difference?
5 units (Delaney) not given 2000-01

87. Social Change in Contemporary China: Remaking the Middle Kingdom—Seminar introduces anthropological methods through studies of social change in contemporary China. How are the economic liberalization and openness of post-Maoist shaping experiences for diverse groups in the People’s Republic? Focus is on changes to interpersonal relations; sex; medicine; shifts in gender, media, gift-giving practices; and rises in urbanization, migration, consumerism, and unemployment. GER:3b,4a (DR:2 or 9)
5 units, Win (Kohrman)

88A. Race and Ethnicity in Mexico—Race and ethnicity in modern Mexico, emphasizing notions of mestizaje, indigeneity, and blackness. The ways race has been understood throughout Mexican history, starting with the colonial encounter’s discourse on indigeneity. Early 20th-century nationalist discourses of mestizaje and indigenismo; the Afro-Mexican experience; and the role of race and ethnicity in current political mobilizations, e.g., the Zapatista rebellion.
5 units, Spr (Vaughn)

TOPIC COURSES AND SEMINARS

82. Anthropology of Medicine: Illness, Culture, and Health—Introduction to basic issues in medical anthropology through discussions of the ways ethnographers, health care professionals and local residents in Euroamerican and non-Euroamerican contexts have understood and responded to modes of bodily distress. Emphasis is on the ways gender, medical diversity, language, social status and cultural commodification mediate health care experiences in places like Haiti, China, South Africa, and Thailand. GER:3b,4a (DR:2 or 9)
5 units, Spr (Kohrman)

85. Trials of the 20th Century: Technology, Law and Culture—Notorious trials in the U.S. are used to examine key questions of technology, science, political movements, and the media. Through critical examinations of major tort cases, e.g., silicone breast implants, the Ford Pinto, and cigarettes, the ways consumer technologies are developed are examined in relation to their status as objects for sale, and what happens when these objects are considered injurious. How scientific evidence is shaped and stabilized by different parties in the legal context. The troubled interaction between the court and the technological innovations, e.g., the polygraph and DNA, and the burgeoning area of scientific expertise. GER:3b (DR:9)
5 units, Aut (Jain)

86. Environmental Politics and Development—How do global environmental problems affect developing countries? What is the relationship between environmental degradation, poverty, and population? Why the perspective of developing countries of the South differs from the industrial nations of the North, and what can be done to reconcile environmental concerns with the amelioration of poverty.
5 units (Gupta) not given 2000-01

5 units, Spr (Davis)

88. Theories of Race and Ethnicity: A Comparative Perspective—Introduces the concepts and theories of race and ethnicity in the social sciences and cultural studies. U.S.-based definitions, ideas, and problems of race and ethnicity are compared to those that have emerged in other areas of the world. GER:3b (DR:9)
5 units, Win (Yanagisako)
130A. Bioethics and Anthropology—(Enroll in Anthropological Sciences 174.) 5 units, Spr (Koenig)

132. Science, Technology, and Gender—Why do we think of engineering as a "masculine" profession? What have women's experiences been in entering fields of science and technology? How has gender been defined by scientists. Issues: the struggles of women in science to negotiate misogyny and cultural expectations (marriage, children), reproductive issues (surrogate motherhood, visual representations of the fetus, fetal surgery, breast feeding, child birth practices), how the household became a specific site of consumerism and technology, and the cultural issues at stake as women join the ranks of scientists. GER:3b,4c (DR:9?)

5 units, Win (Jain)

133A,B,C. Ethics of Development in a Global Environment (EDGE)—(Same as Engineering 297A,B,C.) Wednesday evening seminars on world affairs, mostly on issues affecting poor nations. Autumn Quarter treats war and peace: the background of current wars and peace negotiations, the UN peace keeping efforts, war and religion, arms trade. Winter Quarter treats international resources and commerce: the debt crisis, environmental protection, resource depletion, Japan in the world economy, aid and monetary institutions. Spring Quarter treats "poverty and prejudice": development models, comparative national health, AIDS, control of wealth, India-China-Africa-S. America today. Speakers from Stanford and other institutions are experts who directly deal with world policy makers through research and advisory activities. One unit credit for attendance of the speaker series; 3 units additional credit for optional workshops treating selected issues in more depth. (Sequential registration not required.)

1-4 units, Aut, Win, Spr (Lusignan, Gupta)

134A. The Anthropology of Development—Development as a modality through which cultural, political, and social transformations are engendered. Focus is on issues of identity formation, compliance and subversion, and community. Binary frameworks, e.g., tradition-modernity and local-global, show how these terms are not preconstituted givens, but formed in dialogue with each other in specific contexts.

5 units, Spr (DeHart de Galicia, Sharma)

136. The Anthropology of Consumption—Ethnographic historical approach to the study of consumption and its related topic, production. The social life of things are traced through interconnected processes addressing questions about the organization of labor that helps produce an object; contingencies of value and the making of consumer distinctions; and the role of advertising.

5 units (Ebron) not given 2000-01

137. Introduction to Skills in Archaeology—Introduces the skills used in archaeology to interpret the material traces of the past. The methods range from those used in the natural sciences to those used in the humanities. The integration of methods solve, e.g.: How old is this site? Who were these people? What did they eat? Who was dominant? What beliefs did they have? Training in archaeological skills, e.g., research design, dating methods, faunal analysis, botanical analysis, ceramic analysis, geology, geophysics, earth science, soil chemistry, osteology, genetics, statistics, geography, cartography, and geographic information systems.

GER:3b (DR:9)

5 units, Spr (Hodder)

139. Archaeology in the Modern World—Seminars on current issues in archaeological debates, bringing together information from other archaeology courses about theory, method, and data, and integrating these in relation to contemporary uses of the past in a variety of contexts. Focus is on the use of archaeological data in public spheres, conflicts over the past and the role of the archaeologist in such conflicts, museums and heritage centers, and the practical relevance of theoretical and methodological debate in the discipline.

5 units (Hodder) not given 2000-01

140A. Archaeology of Hunter-Gatherers in Latin America—The evolution of hunter-gatherer societies from the Late Pleistocene until the present, emphasizing the archaeological evidence, with ethnographic and ethnoarchaeological information used as a source of analogy. The pattern of adaptation and the ideological and symbolic aspects of the hunter-gatherers of the region. The peopling of Latin America, the evolution of hunter-gatherer societies during the Holocene, and contemporary hunter-gatherers of Latin America.

5 units, Spr (Politis)

145. Comparative Feminism—Preference to juniors and seniors majoring in Feminist Studies and anthropology. Interdisciplinary seminar for upper-level undergraduates. Women's struggles for empowerment, situating them in the specific cultural and historical contexts in which they have emerged in different parts of the world. Focus: broaden an understanding of women's struggles in the world, and develop analytical models that enable study of these struggles in their complexities and specificities by calling into question dominant assumptions about feminism.

GER:4c (DR:*?)

5 units (Mankekar) not given 2000-01

148. Latino Cultural Citizenship—Cultural citizenship refers to the right to be different and to belong in a participatory democratic sense. Readings are drawn from the historical experiences of Chicanos, Puerto Ricans, and Dominicans in the U.S. and from different disciplines including imaginative literature.

5 units (Rosaldo) not given 2000-01

150C. Introduction to Chicana/o Life and Culture—(Same as Spanish and Portuguese 180E.) Interdisciplinary examination of key literary and visual texts and issues in the chicana and chicano culture. (In English)

GER:3b,4b (DR:3 or 9)

5 units, Win (Rosaldo, Yarburo-Bejarano)

151A. Language in Society—(Enroll in Linguistics 150.)

4-5 units, Spr (Eckert)

152. Symbolic Anthropology—For undergraduates. Symbolic anthropology is an approach to the study of human society developed along with the concept of culture as a system of symbols and meanings, a system presumed to be embedded in and expressed by institutions, values, attitudes, structures of everyday life, and social action. The intellectual roots, exemplary texts, and opportunities to do symbolic analysis.

5 units (Delaney) not given 2000-01

153B. Millennialsim in the American Imaginary: From Columbus to the Present—See 253B. GER:3b (DR:9)

5 units (Delaney) not given 2000-01

154. Creation/Procreation: A Comparative Study—An alternative to the study of religion and reproduction as distinct categories and separate domains. The gendered aspects of cosmological or religious systems and the cosmological significance of gender in terms of their symbolic interrelationships. Anthropological and other literatures examine these relationships in several cultures, including our own. Emphasis is on the ways these beliefs are embedded in practices and structures of social life and on Western categories and meanings, and their implications for theorizing.

5 units (Delaney) not given 2000-01

155A. Magic, Ritual, and Religion—The development of anthropological approaches to magic, ritual, and religion from the early evolutionist and functionalist theories to the ascendance of symbolic analyses and the emergence of post-structuralist interpretations and ethnographies. How some key anthropological objects (e.g., the primitive mind, shamanism,
157. Shaman and Shamanism in Central Asia, Siberia, and the Russian Far East—Introduces the history of Shamanistic beliefs in Central Asia and remote regions of Russia: religious and everyday functions, shaman as phenomenon and persona, shamanistic acts as theater, shamanism and epics, music in shamanism, and medical aspects in shamanism (shaman as healer and hunter of souls).
5 units, Win (Zemtsovsky)

158. Culture and Learning—(Same as Education 287.) Learning in various institutional settings in the U.S. and around the globe. Learning in families, in schools, on the job, and on the streets. Emphasis is on the cultural organization of success and failure in American schools. Tentative consideration of opportunities for making less inequality.
3-4 units, Win (McDermott)

5 units (Delaney) not given 2000-01

174/274. Prehistoric Trade and Exchange—(Graduate students register for 274.) Current approaches to the study of trade and exchange in prehistoric/pre-capitalist societies. The scientific techniques employed in provenancing non-local stone, ceramic, metal and organic goods; alternative methods of sourcing (technological analysis, typology, etc.) Test-cases from archaeological and ethnographic literature examine how archaeologists explain the archaeological record.
5 units, Spr (Carter)

210. Reading Theory through Ethnography—Restricted to first-year doctoral students. Graduate seminar focusing on contemporary ethnography and related cultural and social theories generated by texts. Topics: agency, resistance, identity formation, discourse analysis, etc. Enrollment limited to 10.
5 units, Aut (Rosaldo)

211. History of Anthropological Theory—The history of cultural and social anthropology is studied in relation to historical and national contexts and to key theoretical and methodological issues as these continue to inform contemporary theory and practices of the discipline. Enrollment limited to 15. Prerequisite: consent of instructor.
5 units, Win (Delaney)

212. Anthropological Research Methods—Open to all graduate students; priority to Anthropology Ph.D. candidates. Introduces a range of research methods and modes of evidence building in ethnographic research. Enrollment limited to 10.
5 units, Spr (Lee)

5 units (Inoue) not given 2000-01

235. Mass Media and Subjectivities—Graduate seminar on critical approaches to mass media and popular culture. Object is to collaborate in developing methodologies and critiques and to interrogate prevailing theoretical perspectives. Emphasis is on feminist perspectives, national and transnational circulation and reception of popular texts, questions of narrativity, identity, agency, and cross-cultural conceptions of subjectivity.
5 units (Mankekar) not given 2000-01

243. Culture as Commodity—Graduate seminar focusing on theories of commodification, interests in tourism, national cultures as marketable objects, how identities are constituted through production and consumption. The formation of global style and taste.
5 units (Ebron) not given 2000-01

244. Naturalizing Power: Kinship/Gender/Race/Sexuality—Graduate seminar examines the discursive and material practices through which social relations of inequality are naturalized. Ideologies of family, kinship, gender, race, and sexuality are compared to consider the parallel processes of naturalization and mutual affirmation. The role of anthropological theory in these naturalizations. Enrollment limited to 20. Prerequisite: graduate student or advanced undergraduate major in anthropology, or consent of instructor.
5 units (Yanagisako) not given 2000-01

244A. Sex, Blood, and Representation—Against a background of traditional anthropological theories about gender, procreation, and kinship, explores the transformations that have occurred in the past 25 years. What is the significance of biology, cosmology, culture, and agency in the construction of these concepts and in the implications for practice in everyday life?
5 units, Win (Delaney)

245. Advanced Feminist Theory—Interdisciplinary graduate seminar examines cultural differences and recent feminist theory within dialogues of contemporary social theory. Enrollment limited to 20. Prerequisite: graduate student or advanced undergraduate major in anthropology, or consent of instructor.
5 units (Ebron) not given 2000-01

246. Feminist Perspectives on Globalization and Transnationalism—Graduate seminar examining how women in cross-cultural contexts are implicated by globalization and transnationalism, and how gender provides us with an indispensable lens for studying globalization and transnationalism. Issues: nationalism and citizenship, migration, mass media, circuits of labor in late capitalism, and new regimes of erotics and sexuality.
5 units (Mankekar) not given 2000-01

247. Feminist Methodologies—Interdisciplinary graduate seminar for students with a thorough working knowledge of feminist theories. Focus is on feminist epistemologies and methodologies, drawing on questions from feminists working at the intersection of feminist anthropology and cultural studies, and in political theory, film theory, history, and literary theory. Feminist negotiations of poststructuralism and postmodernism and interrogations of concepts such as difference, experience, fieldwork, location, and voice. Students think through readings by doing specific research, pedagogical, and community projects.
5 units (Mankekar) not given 2000-01

228A. Topics in Sociolinguistic Style—(Enroll in Linguistics 255A.)
1-4 units, Win (Eckert)

285. Politics of Language—Graduate seminar examining the relationship between language, power, and politics, drawing on specific case studies and contemporary developments in theoretical and political linguistics. Enrollment limited to 20.
5 units (Yanagisako) not given 2000-01
250. Nationalism and Gender—The co-implication of discourses of nationalism and gender, focusing on nationalist movements and ideologies in newly-independent countries and “Third World” contexts. Themes: discourses and practices of nationalism with institutions such as the state, mass media, and the family; masculinity, femininity, and militarization; and questions of representation, historiography, location, and strategy.

5 units (Manekar) not given 2000-01

250A. Gender, Race, and Colonialism: On the Politics of Knowledge—Multi-disciplinary seminar exploration of: feminist theory, the historiography of race, and colonial studies. Through readings of theoretically and methodologically important texts to each of these, examines their distinctive politics of knowledge and the ways in which these fields have mutually informed and transformed one another over the last 20 years.

3 units, Aut (Stoler)

251. Cultural Studies—Focus is on the politics of identity and community. Broader topics: questions on nationalism, displaced nationalism, and ethnicity. Interdisciplinary readings in cultural studies provide a theoretical context.

3 units (Rosaldo) not given 2000-01

251A. Latino Studies—Graduate seminar on issues concerning Latino and indigenous groups in the Americas, including racial formations, migration, nationalisms, and settler colonialism. Readings primarily from ethnography, social history, and personal testimony.

5 units (Rosaldo) not given 2000-01

252. Advanced Symbolic Anthropology—See 152.

5 units (Delaney) not given 2000-01

253. Religion and Society—Covers theoretical and ethnographic material, sensitizing students to the complexity of the issues involved in the study of religion. In what ways is it useful, or not useful, to talk of religion as a human universal? What is the nature of religion, how is it practiced and by whom, what counts as religious phenomena and what accounts for the persistence of religion and the power of religious movements? What is the relationship between religion and state and what are some issues blurring that distinction? What is the relation between religion, power, and gender? Prerequisite: consent of instructor.

5 units (Delaney) not given 2000-01

253B. Millennialism in the American Imaginary: From Columbus to the Present—(Advanced undergraduates register for 153B.) Since the “discovery” of America, the land and its destiny have been encompassed by a millennial/apocalyptic scenario. Columbus’ Book of Prophecies, pilgrims and pioneers, and contemporary religious millennial/apocalyptic groups use this scenario for: the interpretation of history, encounters with others, subjectivities and practices, and the construction of a national identity; and broadly raise theoretical issues of the relation between myth and history, subjectivity and identity, and the roots of globalization.

5 units (Delaney) not given 2000-01

254. Narrative, History, and Memory—Interdisciplinary graduate seminar on the debates surrounding theories of narrative and their relevance to ideas of history and memory. The importance of methodological implications of these approaches and their applicability to the analysis of social research, particularly anthropology and history.

5 units (Ebron) not given 2000-01

255. Cultural Citizenship—The right to be different and to be equal, and the political and the cultural issues at stake in this formulation. Readings on the U.S. and the politics of difference.

5 units (Rosaldo) not given 2000-01

257. Medical Anthropology—Graduate seminar examining the history and theories of medical anthropology. Focus is on medical anthropolo-
270. Tourism, Heritage, and National Identity—(Advanced undergraduates register for 170.) While anthropologists have been global travelers in their work, only recently have they turned their theoretical lens to tourists. Theories of tourism; tourism in relation to travel, pilgrimage, adventure; and different kinds of tourism and tourists. Their destinations, the creation and use of "heritage" sites as representations of a nation. The ways touring, itself, and heritage sites are involved in the construction and affirmation of a national identity.
   5 units (Delaney) not given 2000-01

272. Objectification: The Study of Material Culture—Theories of material culture and how the object world participates in social processes. The Hegelian and Marxist background and recent attempts to develop material culture studies between archaeology, anthropology, sociology, and psychology. Why are objects important to us? The relationships between conscious thought and daily material practice. The role of objects in thought and subjective experience. Objects in human evolutionary development and in child development. The nature of commodification. Objects in relation to power, authority, resistance; and in relation to the construction of self. The dependence of human subjectivity on the object world.
   5 units (Hodder) not given 2000-01

273. Introduction to Archaeological Theory—The history of archaeological thought, concentrating on debates that have dominated the discipline in recent decades. Evolutionary theories, behavioral archaeology, processual and cognitive archaeology, and approaches termed feminist and post-processual archaeology in the context of wider debate in adjacent disciplines, focusing on the application and integration of theory in working through archaeological problems and issues.
   5 units, Aut (Hodder)

   5 units, Spr (Carter)

275. Archaeology and Globalism—The emergence of archaeology as a discipline in the context of the rise of the nation state. The emergence of global economies and other global issues has created a new context for archaeology. How are archaeology and heritage responding to this new situation? The idea of "world heritage." The impact of postcolonialism. The commodification of the past: the past as theme park, as travel tourism or nostalgia, as exotic and other. Conflict between uses of the past for identity and as theme park; between heritage and resource or play. The impact of the Goddess, New Age, and other movements. Archaeology and human rights issues (including forensic archaeology).
   5 units (Hodder) not given 2000-01

280. Ethnographic Approaches to Cultural Diversity in Schooling—(Same as Education 280.) How to learn about culture and to analyze education-relevant situations such as the culturally diverse classroom. The cultural process is approached by acquiring techniques of observation, interview, and interpretation of behavior in context, and soliciting and recording the "native" explanations of their own behavior; developing an internally consistent conceptual structure that orients observation and elicitation productively; and being sensitized to one's own culture and how it influences perception and interpretation of behavior. Techniques of ethnographic research applicable to the study of schooling are demonstrated and applied in modest field research projects. Writing of one research report or proposal for research.
   4 units, Win (Spindler)

283. Anthropology of Disasters—Throughout the 20th century, natural and technological disasters became a major cultural and scientific preoccupation. The failures of the engineering miracle that was the Titanic, landslides and ecological havoc resulting from deforestation, and the intergenerational consequences of Chernobyl require students of science and technology to consider the circumstances under which technologies are fallible, how lines are drawn between natural and technological disasters, and how disasters affect segments of the population. Factors: e.g., the rise of engineering education and practice, economic needs for technological infrastructures, cultural fantasies about speed and progress, risk and fear.
   5 units, Spr (Jain)

   4 units, Spr (McDermott)

292. Dissertation Seminar—For graduate students in the process of writing dissertations and preparing for professional employment.
   0-3 units, Aut, Win, Spr (Kohrman)

293. Internship
   1-15 units, any quarter (Staff)

294. Proposal Writing Seminar—Required of Ph.D. students in anthropology in their second year. The conceptualization of dissertation research problems, the theories behind them, and the methods for exploring them. Participants draft a research prospectus of the sort suitable for dissertation proposals and research grant applications. Limited enrollment. Prerequisite: 212 or consent of instructor.
   5 units, Spr (Yanagisako)

295. First-Year Paper—Required of first-year students.
   2-5 units, Win, Spr (Inoue)

296. Research Assistantship—Supervised work with an individual faculty member on a research project. May be taken for more than one quarter.
   5 units (Staff)

297. Directed Individual Study—Opportunities for advanced students to explore special areas of interest.
   any quarter (Staff)

298. Teaching Assistantship—Supervised experience as assistant in one undergraduate course.
   5 units, any quarter (Staff)

299. A.M. Project—Research in connection with the master's paper.
   any quarter (Staff)

AFFILIATED DEPARTMENTAL OFFERINGS

AFRICAN AND AFRICAN AMERICAN STUDIES

105. Introduction to African and African American Studies
   5 units, Spr (McCants)

ANTHROPOLOGICAL SCIENCES

110. Introduction to Language Change
   4-5 units, Win (Fox)

111. Language and Prehistory
   5 units (Fox) not given 2000-01

115. Maya Hieroglyphic Writing
   5 units, Spr (Fox)

213. Topics in Linguistic Anthropology (Vocabulary and Culture)
   5 units, Aut (Fox)

CLASSICS

306. Archaeologies of the Contemporary Past
   5 units, Win (Shanks)
DANCE DIVISION

The Dance Division is dedicated to excellence in dance education and promotes the arts through a comprehensive liberal arts program. We provide a diverse range of courses and specializations in dance, including dance history, dance criticism, and dance performance. The faculty includes experienced dancers and scholars who bring a wealth of knowledge and expertise to the classroom.

The core program of Dance courses required of all majors includes:
- 1. Performance/Literature: 161, 162, and 163
- 2. Stage Management Project: 134, or 34 plus two of 39A,B,C or D
- 3. Senior Project: Drama majors must complete an approved Senior Project in the area of their specialization: a minimum of 2 units in Drama 200.

Two years of a college-level foreign language are strongly recommended.

All majors, in addition to completing the core described above, are required to complete one of the following seven specializations:

1. Acting:
   a) Drama 120A, B (Fundamentals of Acting)
   b) The student must have completed at least 4 units of Drama 29 and acted in at least two department productions.
   c) Drama 28 (Make-Up for the Stage)
   d) Any studio class in Dance
   e) Three additional acting classes
   f) One course in dramatic literature
   g) Six units of approved electives in Drama or Dance
   h) Two units from 39A, 39B, 39C, or 39D

2. Directing:
   a) Drama 170A (Introduction to Directing), 170B (Advanced Directing), and 171 (Undergraduate Theater Workshop)
   b) Drama 166 (Performance, Space, and Technology)
   c) One course in dramatic literature
   d) Drama 30 (Introduction to Theatrical Design)
   e) Drama 31 (Introduction to Lighting and Production)
   f) One course in acting
   g) Two units from 39A, 39B, 39C, or 39D
   h) Five units of approved electives in Drama

3. Playwriting/Dramaturgy:
   a) Drama 177 (Playwriting)
   b) Drama 170A (Introduction to Directing) and 170B (Advanced Directing)
   c) Drama 176 (Undergraduate Dramaturgy Project)
   d) Drama 166 (Performance, Space, and Technology)
   e) One course in dramatic literature
   f) Two courses in acting
   g) Two units from 39A, 39B, 39C, or 39D
   h) Four units of approved electives in Drama

4. Design:
   a) Drama 30 (Introduction to Theatrical Design)
   b) Drama 31 (Introduction to Lighting and Production)
   c) Two of Drama 131, 132, 133
   d) Two units from 39A, 39B, and 39C
   e) Two of Drama 231, 232, 233 or 235
   f) One course in acting
   g) Drama 166 (Performance, Space, Technology)
   h) Five units of approved electives in Drama or Art

5. Technical Production/Stage Management:
   a) Drama 30 (Introduction to Theatrical Design)
   b) Drama 31 (Introduction to Lighting and Production)
   c) One of Drama 131, 132, 133
   d) Two units from 39A, 39B, and 39C
   e) Drama 34 (Stage Management)
   f) One course in acting

The requirements for the A.B. degree in Drama are planned to integrate the critical and historical study of drama with the study and experience of performance. The major provides aesthetic and critical opportunities for students to develop special aptitudes. For example, a student may elect an emphasis in acting, directing, design, or critical theory, or may combine areas of emphasis. Examples of how students can structure their academic and professional career path will be discussed in this seminar. Students are encouraged to declare a major in their sophomore year.

The core program of Drama courses required of all majors is:
1. Performance/Literature: 161, 162, and 163
2. Stage Management Project: 134, or 34 plus two of 39A,B,C or D
3. Senior Project: Drama majors must complete an approved Senior Project in the area of their specialization: a minimum of 2 units in Drama 200.

Two years of a college-level foreign language are strongly recommended.

All majors, in addition to completing the core described above, are required to complete one of the following seven specializations:
1. Acting:
   a) Drama 120A, B (Fundamentals of Acting)
   b) The student must have completed at least 4 units of Drama 29 and acted in at least two department productions.
   c) Drama 28 (Make-Up for the Stage)
   d) Any studio class in Dance
   e) Three additional acting classes
   f) One course in dramatic literature
   g) Six units of approved electives in Drama or Dance
   h) Two units from 39A, 39B, 39C, or 39D

2. Directing:
   a) Drama 170A (Introduction to Directing), 170B (Advanced Directing), and 171 (Undergraduate Theater Workshop)
   b) Drama 166 (Performance, Space, and Technology)
   c) One course in dramatic literature
   d) Drama 30 (Introduction to Theatrical Design)
   e) Drama 31 (Introduction to Lighting and Production)
   f) One course in acting
   g) Two units from 39A, 39B, 39C, or 39D
   h) Five units of approved electives in Drama

3. Playwriting/Dramaturgy:
   a) Drama 177 (Playwriting)
   b) Drama 170A (Introduction to Directing) and 170B (Advanced Directing)
   c) Drama 176 (Undergraduate Dramaturgy Project)
   d) Drama 166 (Performance, Space, and Technology)
   e) One course in dramatic literature
   f) Two courses in acting
   g) Two units from 39A, 39B, 39C, or 39D
   h) Four units of approved electives in Drama

4. Design:
   a) Drama 30 (Introduction to Theatrical Design)
   b) Drama 31 (Introduction to Lighting and Production)
   c) Two of Drama 131, 132, 133
   d) Two units from 39A, 39B, and 39C
   e) Two of Drama 231, 232, 233 or 235
   f) One course in acting
   g) Drama 166 (Performance, Space, Technology)
   h) Five units of approved electives in Drama or Art

5. Technical Production/Stage Management:
   a) Drama 30 (Introduction to Theatrical Design)
   b) Drama 31 (Introduction to Lighting and Production)
   c) One of Drama 131, 132, 133
   d) Two units from 39A, 39B, and 39C
   e) Drama 34 (Stage Management)
   f) One course in acting
MINORS
- For students wishing to minor in Drama, the following core requirements must be met:
  1. The three-quarter sequence in Performance/Literature: Drama 161, 162, 163.
  2. Stage Management Project: 134, or 34 plus two of 39A, B, C, or D.
  3. A practical production class in technical theater or performance: one of Drama 29, 39A, 39B, 39C, or 39D.
  4. Elective courses totaling a minimum of 15 units from the specified courses in any one of the seven specializations listed above would constitute a minor concentration in: Acting, Directing, Playwriting/Dramaturgy, Design, Technical Production/Stage Management, Dance, or Performance Theory and Cultural Studies.

HONORS PROGRAMS

DRAMA
- For a limited number of students, the department confers the degree of Bachelor of Arts with Departmental Honors in Drama. To be considered for departmental honors, students must meet the following requirements:
  1. The student must have fulfilled the requirements for the Drama major.
  2. The student must be a Drama major in good standing with a grade point average (GPA) of 'B+' including all the student's work in Drama.
  3. The student must have completed prerequisite courses in the area of specialization with a GPA of 'A-' or better.
  4. The student must have completed a senior project that the Department of Drama considers outstanding.
  5. Honors are awarded on the basis of both the senior project and the student's entire work in the Department of Drama.

HUMANITIES
- An honors program in Humanities is available for Drama majors who wish to supplement their major with related and carefully guided studies. See the "Interdisciplinary Studies in Humanities" section of this bulletin for a description of the honors program. Students who enroll in this program may offer Humanities 160 and two seminars from 190-198 in fulfillment of the departmental elective requirement.

GRADUATE PROGRAMS

DOCTOR OF PHILOSOPHY

University requirements for the Ph.D. are described in the "Graduate Degrees" section of the bulletin.

All graduate study in the Department of Drama leads to the Ph.D. degree. The doctoral program in Drama aims to integrate practical theater work with the critical and historical study of dramatic literature and theory. All candidates are expected to function both as scholars and as theater directors. The curriculum offers a two-year practical concentration in directing along with the study of critical and performance theory, aesthetics, history, and literature. The goal of the program is to give students a thorough knowledge of the field that leads to original and significant scholarly work grounded in practice as well as an inventive directorial practice that is based on solid scholarly analysis.

The following department requirements are in addition to the University's basic requirements for the doctorate.

UNITS AND COURSE REQUIREMENTS

1. A minimum of 72 units of graduate courses and seminars in support of the degree. These units are in addition to units for the doctoral dissertation.
2. The sequence in Performance and Critical Theory (Drama 300, 301).
3. Six additional graduate seminars within the Department of Drama. These must include at least one seminar in each of the following fields: (a) intersections of theory and performance (designated by suffix A in course number); (b) theater history (designated by suffix B in course number); and (c) dramatic literature (designated by suffix C in course number).
4. The five workshops in directing: Drama 370, 371, 372, 373, 374. In the first year, students will take 370 (Concepts of Directing), 372 (Projects in Directing), 371 (Visual Aesthetics for the Director), and 373 (Directing and Dramaturgy). The Projects class consists of the conceptual development, design, and production of a short play in a multi-form space. In the second year, students take Drama 374 (Graduate Directors' Performance Project) to stage a more fully developed production chosen in consultation with the faculty.

LANGUAGE REQUIREMENT

The candidate must demonstrate reading knowledge of one foreign language in which there is a major body of dramatic literature. The language requirement may be fulfilled in any of the following ways:
1. Achievement of a sufficiently high score (70th percentile) on the foreign language examination prepared by the Educational Testing Service (ETS). Latin and Greek are not tested by ETS.
2. A reading examination given each quarter by the various language departments, except for Latin and Greek.
3. Passage with a grade of 'B' or higher a course in literature numbered 100 or higher in a foreign language department at Stanford.

The language requirement must be met before the student can be advanced to candidacy.

TEACHING REQUIREMENT

Six quarters of supervised teaching at half time are a required part of the Ph.D. program. The requirement is normally met by teaching three courses during the second year and three courses during the third year. It may include a fully produced staging of a full-length play.

EXAMINATIONS

Candidates must complete three examinations, one comprehensive and two qualifying examinations, by the end of the first three years of study at Stanford.

The comprehensive examination is taken as a four-hour sit-down in the Spring Quarter of the first year. The first part of the comprehensive exam is based on a range of texts given to the student by the department at the beginning of the first year. The second part of that exam is based on a list of texts from a given period determined by the student and faculty adviser. It may focus on texts or critical approaches of special interest to the student. Students who do not enter with a significant background in dramatic literature may opt to take this exam in the week prior to the start of classes in the second year.

The first qualifying exam, which must be completed before advancement to candidacy at the end of the second year, consists of three 15-25 page essays written in consultation with a faculty adviser, covering a specific period of dramatic literature and theater history. These essays should not duplicate any written work from seminars. One essay should deal with practical aspects of the period, e.g. directing; one essay should focus on theater history of the period; and one essay should focus on dramatic criticism related to a specific text of the period. After approval by the adviser, the Graduate Studies Committee reads and evaluates these essays.

The second qualifying examination is a departmental oral with three faculty members, at least two of whom should be from the Department of Drama. This oral covers a second period of dramatic literature and theater history. The format of this exam approximates that of the University Oral.

For the two qualifying examinations, the essays and the oral, each student will work out a program of study with a faculty adviser drawing from the following periods of Western drama, but may include non-Western texts:

- Classical
- Medieval and Renaissance
- 17th, 18th, and early 19th century
- Modern: 1870-1980
- Contemporary: 1980 to the present

SATISFACTORY PROGRESS

Graduate students in Drama are expected to make consistent progress toward the completion of the Ph.D. degree. At the end of the first year, the departmental Graduate Studies Committee evaluates the work of each student in classes, seminars, examinations, and in performance work. Continuation in the program depends upon the recommendation of this faculty group. At the end of the second year, the committee reviews the student's work in consideration of advancement to candidacy. At the end of the third year, students are expected to have developed an approved dissertation prospectus in preparation for the University oral.

APPLICATION FOR CANDIDACY

By the end of the second year of residence, the following requirements or appropriate equivalents must be completed:

1. Performance and Critical Theory sequence (Drama 300, 301) and four seminars
2. The directing workshop series (Drama 370-374), including the successful production of two works in public performance
3. A foreign language
4. At least two examinations

Based on its evaluation of the student's progress, the Graduate Studies Committee certifies the student's qualifications for candidacy. Upon favorable action, the student files formal application for candidacy, as prescribed by the University, by the end of Summer Quarter of the second year.

DISSERTATION PROSPECTUS

The dissertation prospectus must be approved by the candidate's adviser and by the departmental Graduate Studies Committee by the end of Spring Quarter of the third year.

UNIVERSITY ORAL EXAMINATION

The University oral examination, to be taken during the fourth year, is to demonstrate the candidate's ability to conduct significant research in the general area of the dissertation. The examining committee consists of four faculty members, at least two of whom must be from the Department of Drama, as well as one faculty chair from outside the department. The University oral covers the area of the dissertation and is based on the prospectus and bibliography of the candidate.

DISSERTATION

Normally, the Ph.D. program is completed in four years. The first year should be devoted to full-time graduate study, the second and third years to graduate study and teaching, the fourth year to writing the dissertation. Following formal admission to candidacy (typically at the end of the second year), the dissertation must be completed and approved within five years from the quarter in which candidacy is granted. A candidate taking more than five years is required to restate candidacy by repassing the written examinations on dramatic literature.

APPLICATION AND FELLOWSHIPS

Applicants for the Ph.D. program may write directly to the Department of Drama for information and to Graduate Admissions, Registrar's Office, Old Union, Stanford, CA 94305-3005, for an application. In addition to the required statement of purpose, all applicants must submit a statement detailing their practical theater experience, a sample of their written critical work, and a statement on directing. An interview, while not required, is recommended. Interviews are best scheduled after January 10 and before February 9. Graduate students in the Department of Drama begin study in the Autumn Quarter of each academic year; there are no mid-year admissions. All graduate students must be degree candidates. All admissions materials must be submitted to the Department of Drama, Memorial Auditorium m144, 551 Serra Mall, Stanford, CA 94305-5010 by December 15, 2000.

The Department of Drama awards a number of fellowships to students in the Ph.D. program.

FOR MORE INFORMATION

Write to the Department of Drama, Memorial Auditorium, m144, 551 Serra Mall, Stanford, CA 94305-5010 or telephone (650) 723-2576. The FAX number is (650) 723-0843. Email is et.jlf@forsythe.stanford.edu and the website is: http://www.stanford.edu/dept/drama/ where you may download the latest information in PDF format.

JOINT PH.D. IN DRAMA AND HUMANITIES

The Department of Drama participates in the Graduate Program in Humanities (GPH) leading to a joint Ph.D. degree in Drama and Humanities. For a description of that program, see the "Interdisciplinary Studies in Humanities" section of this bulletin.
The Committee on Black Performing Arts (CBPA) is an interdisciplinary program supporting the presence of Black art forms at Stanford. Started as a student project in 1968, the committee became an official University program in 1972. In 1997, the CBPA joined the Department of Drama as a division.

The CBPA functions as: (1) a liaison with departments in hiring faculty and devising courses in Black performing arts; (2) a presenter of professional performances in dance, drama and music, and film and symposia, framed by related academic study in anthropology, dance, drama, history, philosophy, and sociology; (3) a producer of student productions; and, (4) as a resource for student organizations promoting artistic expression in the Black cultural tradition. Through the cooperation of the departments, students are able to take relevant courses in dance, drama, literature, and music. While the offerings do not, at this time, constitute an academic minor, students are able to concentrate studies in Black performing arts as part of the A.B. major in African and African American Studies or Drama.

The CBPA publishes a journal, the Black Arts Quarterly (BAQ), three times a year. The BAQ is a forum for reflective explorations of Black performativity. It showcases original student work from campuses across the country and addresses the material impact of Black representation in the arts, in media, and popular culture.

The CBPA has developed a strong relationship with the city of East Palo Alto through the holding of artist residencies in the community and via "Dreams of a City: The East Palo Alto Project." The project incorporates commissioning plays, co-producing a video documentary and creating an archive about the community. The CBPA intends to continue its relationship with East Palo Alto in its future programming.

DANCE DIVISION

The Dance Division aims to develop trained bodies, inquiring minds, and aesthetic imaginations through movement as well as dance scholarship. The program emphasizes informed and active engagement in dance by stimulating a range of intelligences that honor somatic wisdom.
